During his stay, we are to be favored with a few of those striking and marvelous scientific lectures for which he is celebrated, and which have attracted so much attention in London. The first lecture is announced for October 30th, at Steinway Hall in this city. Some of Professor Pepper's experiments with light and electricity are said to be quite astonishing, his appliances for direct illustration being very effective and original.

COMPARATIVE TESTS OF INSULATORS.

Date.	Time.	Deflection of Galvanometer. Glass.	Deflection of Galvanometer. Pond.	Remarks.
1872				
Oct. 18.....	3 — P. M.	11¼°	¼°	Fine rain 4 hours.
Oct. 25.....	4 — P. M.	17½°	1¼°	Rain 36 hours.
Oct. 26.....	11 — A. M.	26°	2° nearly	Rain 48 hours.

These tests were made through both coils of a Varley galvanometer, the first test with 65 cups, and the two last with 85 cups of battery.

ATLANTIC CABLE BUSINESS.

Note the following changes in the instructions for Atlantic Cable business:

For 8th and 9th line of Rule 2, page 248 of Tariff Boook, read: "The 'place from' must be inserted and paid for throughout in messages to points beyond Great Britain and Ireland."

Instead of Rule 4, on page 249, read as follows:

RULE 4.—PREPAID REPLIES.—The sender of a message may prepay the reply as follows: The sender must insert, immediately after the address, and pay therefor, the words "Reply —— words, paid." The number of words paid for will be written in the blank space. In cases where more than one reply is required and prepaid, the sender must state the number of replies thus: Three replies, each — — words, paid."

For the instructions on page 253, above "RULES," read as follows:

"Messages are forwarded by the cheapest route, unless specially directed by any other. When there is more than one route to the same place at the same charge, and messages are not specially directed, they are forwarded by the best route at the discretion of the Telegraph Officials. The indication of route is charged between America and London or France. Beyond London or France it goes free. Messages destined for places to which there is no telegraph communication, must contain the name of the place from which they are to be posted The charge for postage is 37 cents."

The following is a revised list of tariffs, to be used instead of that given on Pages 251,-252 & 253 of Tariff Book:

TARIFF TO PLACES BEYOND GREAT BRITAIN, AND IRELAND, AND FRANCE.

On messages going beyond Great Britain, Ireland and France, charge the following rates, in gold, IN ADDITION TO THE TARIFF TO FRANCE:—Half-rates for each additional 10, or fraction of 10 words.

	Tariff for 20 words, or less.
Aden	$15 00
Algeria & Tunisia, via Marseilles	1 60
" via Malta	3 62
Australia—Port Darwin	46 62

CUBA CABLE.

The notice in relation to "Cable to Aspinwall," published in last JOURNAL, is hereby countermanded.

WILLIAM ORTON, President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, Oct. 22, 1872.

The following Offices have been transferred from Jas. Coleman's District to J. B. Tree's District:

Memphis, Tenn.
Clarksville, "
Humboldt, "

G. H. MUMFORD, Vice-Pres't.

EXECUTIVE OFFICE,
NEW YORK, Oct. 31st, 1872.

On and after November 4th, *Opelika, Ala.*, will be added to the list of money-order offices in C. G. Meriwether's District, and *Greensboro, Ala.*, will be stricken from the list of money-order offices in same district.

G. H. MUMFORD, Vice President.

Digitized by Google

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York.
November 1, 1872.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular.

GENERAL INFORMATION.

Communications relating to checks, or otherwise, with the White Mountain "Summer" officers in N H., *now closed*, may be addressed to Geo. W. Gates, Supt. White River Junction, Vermont.

Covington, Ga., closed.
Dalton, Ga., re-opened.
329 Mound City, Ill., is in Pulaski Co.
368 Mounds, Ill., is in Brown Co.
299 Newport, Ind., is in Vermillion Co.

Messages may be taken for Greenupsburg and Riverton, Ky., to be delivered from Haverhill, Ohio. Charges for delivery, 25 cents.

Cambridge, Md., check direct.
Colebrook, N. H., should read, 50 3 14 Portland, Me.
Plaistow, N. H., closed.
Rochester N. H., should read, 25 2 17 Great Falls, N. H. / 30 2 14 Portland, Me.
Dickson, N. Y., closed.
Pleasant Valley, O., P. O. A., Plain City, O.
Urichsville, O., closed. Messages for Urichsville are delivered from Dennison, Tuscarawas Co., O. Charges for delivery, 25 cents.
Avenue Drove Yards, W. Phila., now W. Union office, check direct. Tariff ten cents more than Philadelphia, Pa.
102 Keating, Pa., is in Clinton Co.
Rockdale, Delaware Co., Pa., P. O. A. is Glen Riddle, not Lenni Mills, as given in tariff book.
Highgate Springs, Vt., closed.
Blacks and Whites, Va., closed.
Strasburg, Va., should read, 45 3 77 Alexandria, Va., instead of 20 2 108 Winchester, Va.

NEW OFFICES.

286 Cooper, Ala.
285 Cunningham, Ala.
285 Gilmans, Ala.
285 Wilhites, Ala.
* Decatur, Ind. 60 4 242 Richmond, Ind. / 25 2 261 Fort Wayne, Ind.
* Geneva, Ind. 50 3 242 Richmond, Ind / 35 2 261 Fort Wayne, Ind.
* Newport, Wayne Co., Ind. 25 2 242 Richmond, Ind. / 65 4 261 Fort Wayne, Ind.
* Portland, Ind. 40 3 242 Richmond. Ind. / 261 Fort Wayne, Ind.
* Mill Bridge, Me 25 2 9 Cherryfield, Me.
231 Blissfield Junction, Mich.
* Fayette, Hillsdale Co., Mich. 25 2 231 Blissfield Junction, Mich.
* Morenci, Mich. 25 2 231 Blissfield Junction, Mich.
* Crow Wing, Minn. 150 10 307 Chicago, Ill.
388 Alexandria, Mo.
465 Falls City, Neb.
474 Firth, Neb.
52 Port Oram, N. J.
203 Hanging Rock, Ohio.
203 Haverhill, Ohio.
202 Junction City, Ohio
212 Kirby, Ohio.
202 Somerset. Ohio.
59 Bingen, Pa., check Quakertown, Pa.
340 Middleton, Tenn.
480 Jacksonville, Texas.
486 Spring Station. Texas.
570 Camp Stambaugh, Wy.

OFFICES HAVING "SPECIAL SHEET A"

Will hereafter check Lansingburgh and Cohoes, N. Y., same as "Special Rate" to Troy, N. Y.

WILLIM ORTON,
President.

THE annual report of the Western Union Telegraph Company, recently published, is a synopsis of facts which command attention, by their very magnitude. As a single item, let the reader consider fully in his own mind how much is meant by the statement that the company owns and has in operation 137,190 miles of wire—enough to reach nearly six times around the globe. On the 30th of June last the Company had in its employ 8,347 persons, and had open for business 5,237 offices. The messages sent over the wires of the Western Union last year numbered 12,444,449, an increase of 1,798,422 on the business of the previous year. The earnings of the Company are enormous, but its present policy is to extend its lines and perfect its equipment rather than pay dividends, and accordingly no dividends are to be paid this year. From its inception the Western Union has been a corporation in which Cleveland has felt a special interest. Its founder and its ablest managers have been Cleveland men, and here for years was the centre from which its vast interests were managed. It is one of the most colossal, enterprising and successful corporations of modern times.—*Cleveland Leader, Oct.* 16, 1872.

BORN.

ADAMS.—At Cedar Falls, Iowa, Sept. 24. 1872, a son to George D. Adams, Agent and Operator B. & M. R. R. R., Russell, Iowa.

BOOTH.—At Salineville, O., Oct. 9, 1872, a son to M. E. Booth, Manager W. U. Telegraph Office, Salineville, O.

MARSH—At Pittsburgh, Pa., Oct. 18, 1872, a son to F. H. Marsh.

PHILLIPS—At Olathe, Kan., Sept. 1, 1872, a daughter to Marshall Phillips, Manager W. U. Tel. Office.

MARRIED.

ARTHUR—HUDD.—At Beaver, Pa., Oct. , 1872, by Rev. L. H. Lock, J. G. Arthur, Manager W. U. Telegraph Office and Express Agent, Hanover, O., to Miss Mattie Hudd, of Hanover.

COCKERELL—WHARTON—At Belle Centre, O., Oct. 15, 1872, by Rev. Mr. Shockey, T. W. Cockerell, Operator A. and G. W. Ry., Mansfield, O., to Miss Sierra Nevada Wharton of Belle Centre.

MELLEN—EVANS—At Salem Church, Pettis Co., Mo., Oct. 13, 1872, by Rev. Josiah Godbey, J. H. Mellen, Manager W. U. Tel. Office, Smithton, Mo., to Miss Charlotte H. Evans, both of Smithton

POOLE—CARSON—At North Conway, N. H., Oct. 9, 1872, C. J. Poole, Manager W. U. Tel. Office, North Conway, to Miss Annie M. Carson, of Conway.

DIED.

CONNELL—At Janesville, Wis., Oct. 1872, of Inflammation of the Bowels, James Connell, Telegraph Operator. His remains were taken to his home at Olean, N.Y. for interment.

WE learn from Buenos Ayres that Mr. Burton has recently added 386 miles of telegraph to the thousands already working through the provinces.

JOURNAL OF THE TELEGRAPH.

VOL. V. NO. 24. NEW YORK, NOVEMBER 15, 1872. WHOLE NO. 121.

RHEOCORDS AND RHEOSTATS.

For making exact measurements of small resistances, Poggendorffs Rheocord, is admirably adapted. The following cut, figure 1 will serve to illustrate the construction of the instrument :

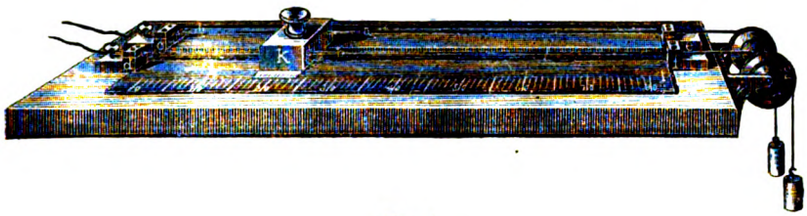

Fig. 1.

Two platinum wires *a*, *b*, are stretched out on a board, and the terminals of each pressed between two metalic plates ; the termini of *a* by *c* and *e*, and those of *b* by *d* and *f*. The terminals of *a* and *b* after passing through the plates at *e* and *f* are also attached to silken strings passing over pulleys and fastened to weights. A brass measuring rule *h*, *i*, is placed under the wires, which are insulated from the metallic plates *c*, *d*, and *e*, *f*. A slide, K, consisting of a small square metallic box whose sides turned towards the clamps are composed of parallel panes of glass or ivory, moves up and down on the measuring rule. In the glass or ivory panes, small holes are made, through which the wires can barely pass, and the box is filled with mercury.

When the clamps *c*, *d*, are connected with the poles of a battery, the current from *c* passes through the wire *a* to the box *K*, thence through the mercury which is contained in it to the wire *b*, and thence to the other pole. If the box is moved to the right, the length of the connecting wire is increased, and if pushed to the left, diminished. The measuring rule indicates the extent of the increase or decrease of the wire when the box is moved. Knowing the resistance of the German silver wire stretched between the clamps, as well as the resistance of every fractional division of it, the smallest sub-division of the wire may be employed as a unit of measurement for determining resistances either by the differential or substitution methods.

When greater resistances are to be measured, standard resistance coils or Rheostats made of German silver wire are employed. The most simple arrangement of such a resistance apparatus is represented by figure 2. A series of short metallic bars are placed at equi-distance upon a board in such a

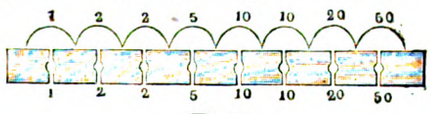

Fig. 2.

manner that they can be connected together by means of brass plugs. The brass bars are attached to the extremities of the various German silver coils of wire which compose the various resistances represented. If all the holes are plugged then no resistance is inserted. If any hole is unplugged then as many units of resistance are inserted as are indicated by the numbers standing under the hole. By adding up the numbers unplugged we ascertain the total resistance inserted. The resistance coils are protected by a box, on whose upper plate the binding screws for connecting the line and battery wires are placed, as represented in figure 3. When very great resistances are required Rheostats are made as represented in figure 4.

This is a compilation of sixteen separate resistance coils, ranging from one British Association unit, or ohm, to five thousand B. A. units or ohms securely enclosed in a mahogany or rosewood box, A. The extremities of resistance 1, are attached to the metallic plates *a* and *b*, those of the next resistance 2, to *b* and *c*, and so on. When the holes between the clamps or metallic plates are not plugged, the respective resistance is inserted. The extremities of the wires to which the Rheostat is to be connected are inserted in the binding screws 1 and 2. The metallic spring F, fixed at 1, can be connected with 2, and thus short circuit the resistance coils, or throw them all out. This attachment is rarely ever

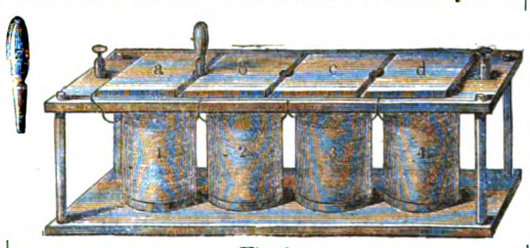

Fig. 3.

employed in resistance coils, made or used in this country, but instead of it an infinity clamp is employed, which when left unplugged, leaves the apparatus open or disconnected. The scale is formed for putting in of any portion or all of the resistance, as desired. When the holes are plugged as represented in the cut, a resistance of 4,478 units is given.

In making a resistance coil care should be taken to wind one-half of the coil in one direction, and the other half in the opposite direction in order to prevent induction. A current exerts an inductive action upon the wire through which it flows called the induction of a current open itself, the effect of which upon a coil is to produce an induced current at the moment that a current commences to flow through the coils, and another at the moment when the battery current is broken. By winding the coils as suggested, this difficulty is prevented as the inductive effect is neutralized.

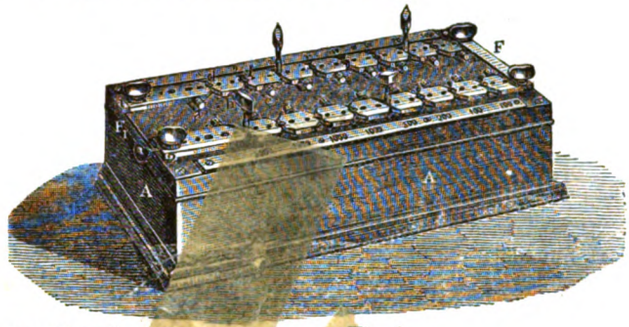

Fig. 4.

IS ELECTRICITY GENERATED BY WATER CURRENTS?

Zöllner has ascribed the production of the electric currents of the earth to the incandescent molton masses in motion beneath the crust which generate currents in the direction of their own motion ; and he has expressed the opinion that all current movements of fluid, especially when in contact with solid bodies, are to some extent accompanied with currents of electricity that have the same direction as the fluids themselves. He inserted the ends of the copper wires of a very delicate galvanometer, of Sauerwald, just within the wall of a caoutchouc tube conveying a stream of water, and observed a deflection of several degrees of the galvanometer scale, thereby indicating the existence of an electrical current whose direction is that of the water. The greater the distance between the ends of the wires—which, by the way, need not be exposed to the force of the current, but may be replaced by metallic plates lying against the wall of the tube—the stronger the deflection of the needle.

While recently repeating Zöllner's experiments. Beetz obtained similar results, but found that the currents have a much similar origin. The needle is deflected so long as the reservoir in which the water falls is not isolated. The metal tap, the stream of water, and the reservoir, in fact, form a voltaic element (brass, water, lead) whose current it is which deflects the needle. By filling the reservoir, and dipping the free end of the tube, also filled, into it, the current is observed though the water be shut off, nor does any change take place when the tap is opened. By simply inverting the position of the tube, the direction of the current is reversed ; this is observed to be the case with or without the flow of water. If the reservoir be isolated, no current is formed ; this is so whether the water be allowed to flow or not. When tap and reservoir are of zinc, no current is produced with or without a flow of water, and with or without isolation of the reservoir. According to Beetz's observations, then, no electricity is generated by a stream of water.

ELECTRICAL BATTERIES.

Mr. E. G. Bartholomew lately read a paper on this subject before the Society of Engineers, London.

The author said he has always regarded it as an apt illustration, to draw a parallel between the electric telegraph and the steam engine. The conductor may be compared to the steam pipe; the one conveys the electricity from its source, the battery, to act upon the instrument: the other conveys the steam from its source, the boiler, to act upon the engine. Again, the instrument will bear a strict comparison with the engine, for both are mere machines constructed in such a manner as to be best influenced by the power conveyed to them. There then remains, in either case, the source of power. Now, what a steam engine would be without the boiler, a mere combination of inert pieces of mechanism, the electric telegraph would be without the battery. For this reason it has been thought that the battery forms a subject worthy of a separate notice.

The progress of telegraphy may indeed be regarded as dependent in a large degree upon our knowledge of the battery.

The identity of electricity, from whatever source derived, whether from the friction of certain substances, from evaporation, from the chemical action set up under certain conditions, from magnetism, or from heat, is not doubted. It may differ in degree but not in nature. If it be true, as has been asserted, that when we eat an egg with a metal spoon we generate electricity, the electricity so evolved will be identical with the flash which rends the oak. And certain substances, and certain combinations of substances, afford greater facilities for the development of the force than others; and it has been a part of the study of the modern philosopher to ascertain by what means the greatest amount of electrical force can be obtained at the least possible cost. The well-known story of Galvani's accidental discovery of a force hitherto unsuspected requires no repetition here, nevertheless, we are bound to ascribe to him the honor of finding that certain metals, when converted by a fluid, would develope electricity; and when Volta subsequently produced a real battery by examining the laws of production and multiplying the combinations, he only followed in the path his predecessor had indicated.

The simplest voltaic combination is that in which two metals, as copper and zinc, having different affinities for oxygen, are immersed in a liquid capable of oxidizing one of them. Under such conditions a current of electricity is generated upon the surface of the most oxidizable, and, passing through the liquid, is given off at the other metal; and if a wire connect the two plates the current will continue to flow through it, from the receiving to the generating plate, so long as the necessary conditions are fulfilled.

It has been ascertained that those metals or substances which differ most in their affinity for oxygen will form the most powerful combination. The order of the substances is as follows: Graphite (carbon from gas retorts), platinum, silver, copper, iron, lead, tin, zinc. Hence a combination of graphite and zinc forms a powerful battery, and, as both substances are comparatively cheap, this form of battery is of frequent occurrence. The great desiderata in a battery required for telegraphic purposes are its ability to overcome R (or resistance) and its constancy in action. The power a battery possesses of overcoming R is called electromotive force.

There are two distinct characteristics in a battery, dependent upon the order in which the same combinations are arranged; thus, if one pair of large plates, say 12 inches by 12 inches, be employed, the quantity of electricity generated will be considerable, although the electromotive force will be small. If, however, a similar pair of plates be cut up into 144 pieces 1 inch by 1 inch, and the 144 combinations be so arranged in 144 separate cells as that the − plate of the one be connected with the + plate of the next, and so on throughout the series, a battery is then obtained possessing 144 times more electromotive force. Its latter property is termed its tension, and is applied to the entire series, the electromotive force being more strictly applied to the specific energy of each combination.

Where great energy is required, the Grove Battery becomes the most valuable of all combinations. In this arrangement amalgamated zinc and sheet platinum are employed, separated by a porous diaphragm. The zinc stands in a strong solution of acid sulphur, and the platinum in pure nitric acid. The action is as follows: The hydrogen element of the decomposed water, instead of passing over to the collecting plate and forming upon its surface, is entirely suppressed by the nitric acid, which becomes slowly deoxidized and converted into nitric acid, which passes off in dense red fumes. This is a serious drawback to the use of this battery.

One of the most valuable batteries for telegraphic purposes, where a constant current is not required, is the Leclanche. It consists of a zinc rod placed in a solution of common chloride of ammonia (sal ammoniac), in which stands a porous pot containing a piece of carbon surrounded by a mixture of gas carbon and a peculiar form of peroxide of manganese broken into small pieces, but separated from any powder. When the battery is in action, chloride of zinc is formed. When the sal ammoniac has become nearly removed from the liquid, it cannot dissolve the chloride of zinc, and the liquid becomes milky; more of the salt must then be added.

In a battery consisting of many plates in a series, all the plates should be of the same size, and all the cells in the same condition, as one faulty cell will not only rob the entire series of the value of itself, but will injure the action of the whole. Every cell of a battery should therefore be periodically tested separately, and, if the quantity of any one cell be less than the average of the others, it should be rejected or remedied. The battery itself, although the source of power, yet possesses resistance to the passing of its own current.

ON THE ORIGIN OF ATMOSPHERIC ELECTRICITY.

[From the American Artisan.]

BY DR. ADOLPH OTT.

There are few departments of physical science in which more hypotheses have been framed regarding the origin of a force than in that which treats of the electricity exhibited by the air. At the time when only frictional electricity was known, the phenomena of atmospheric electricity were sought for in the friction of the air against the clouds and the earth.

Priestly was of the opinion that there existed an empty space above the clouds, having an electricity opposite to that of the earth. "May not thunder and earthquake," he inquires, "be owing to the re-establishment of the equilibrium between the two electricities?" Franklin entertained the opinion that the sea conveys to the air the electricity with which it is charged, and Volta sought it in the evaporation of water at the service of the earth. This view was also adopted by Pouillet, to whom we owe quite a number of original experiments. This scientist found that electricity is always produced when the evaporating water holds in solution gases, acids, or salts. The steam becomes positively electrified, the solution negatively. Reich confirmed those experiments, but he showed also that the signs of electricity must not be attributed to evaporation, but to the friction of the finely divided liquid against the sides of the platina capsule used in the experiment. Again, signs of electricity are only obtained when the liquid boils, never by slow evaporation. It is known that Pouillet considered the act of vegetation as another source of electricity in the air. We know that plants yield carbonic acid, while they inhale oxygen. If it be true, says that philosopher, that carbonic acid is positively electrified at the moment of its being set free, it follows that plants ought to yield positive electricity. He tried to verify this supposition directly by experiment. Riess, however, showed that electricity produced by vegetation was very variable; now negative and then positive; and investigations with earth alone left little doubt that the signs of electricity afforded are not due to the process of vegetation. In fact, it follows from all investigations of Riess and Reich that the conclusions arrived at by Pouillet regarding the origin of electricity by evaporation as well as vegetation are not demonstrated by experiment. Thus, the only opinion which presented some degree of probability has fallen to the ground. Peltier, Jr., propounded an altogether new theory regarding this subject, which is now entertained by the most distinguished physicists of the day. Lamont, in Munich, explains this theory substantially as follows:

The earth possesses a fixed quantity of negative electricity, the distribution of which only is changeable. Let us call this electricity the permanent electricity of the earth, in contradistinction to the induced one, generated by an isolated body, when approached by another electric substance. The atmosphere, viz., *the pure air, possesses no electricity whatever;* it is neither capable of conducting nor retaining electricity. If our earth had a perfectly smooth and uniform surface, all points would exhibit an equally strong tension; however, this equilibrium is disturbed by two agencies, namely, by the elevations of the globe itself, and the vapors floating in the air.

It is a well-known fact that electricity collects preferably in points and edges, whence the fact explains itself why it accumulates on roofs, church-towers, mountain-summits, and that collecting apparatus become charged the more the higher they are elevated from the ground.

The second above-mentioned cause which brings about an unequal distribution of electricity on the earth's surface is the watery vapor contained in the air. In this case, the vapor may either be in contact with the earth, or it may be isolated. In the first instance, the same phenomena take place as upon mountains—the electricity leaves that part of the earth's surface in contact with the vapor, and collects on the surface of the latter. With regard to the second case, it is to be considered that all bodies may contain latent or disguised electricity in unknown quantities, which is set free, according to known laws, when another electric body is approached. Thus it is explained why clouds, floating in the air by the distributing action of the earth, become now positively and now negatively electrified.

By this theory, the various indications of electro-atmospheric instruments find as simple and easy an explanation as by the hypothesis of the electricity of the air. Upon an electrometer provided with a point, the *negative electricity of the earth* acts under a clear sky, distributing in such a manner that the positive electricity of the isolated system is drawn

Digitized by Google

into the pendulums, while the negative escapes through the point. It is evident, on the other hand, that, in the systems of Lamont and Delmann, where a ball is brought into connection with the ground, *negative electricity* must stream in. If the observations are conducted under a cloudy sky, after continuous rain, and when the air is saturated with vapors, so that the clouds are in conducting connection with the earth, the electrometer exhibits *no tension*. In this case, the electricity has collected at the upper borders of the clouds, the observer being in the interior of the electrified body, in which, as little as in a room, electric tension can exist.

Electrified clouds isolated from the earth react distributing on the latter. A negatively electric cloud induces a decrease of the permanent electricity of the earth's surface, and, if strongly charged, may bring about an accumulation of positive electricity at those points above which it floats. A positively electric cloud, on the other hand, will increase the permanent negative electricity of the earth.

The electrical phenomena which take place in the atmosphere have thus received a basis for rational explanation, and it is to be seen whether by, further investigations, this theory will be confirmed or rejected.

LAWS OF MAGNETISM.

1. A magnetic field is any space in the neighborhood or under the influence of a magnet.

2. The unit pole is that which at a unit distance from a similar pole is repelled with unit force.

3. The intensity of a magnetic field at any point is equal to the force which the unit pole would experience at that point.

4. The direction of the force in the field is the direction in which any pole is urged by the magnetism of the field; this is the direction which a short, balanced, freely suspended magnet would assume.

5. An uniform magnetic field is one in which the intensity is equal throughout, and hence the lines of force parallel.

6. Opposite poles attract each other; similar poles repel each other.

7. The forces directed from any magnetic point upon equal masses are reciprocally proportional to the square of the distance.

8. When two magnets are very small, and the distance between them very great in proportion to their length, the magnetic action between them is reciprocally proportional to the cube of their distance.

9. The force directed from any magnetic point upon any other mass upon which it acts is reciprocally proportional to the square of the distance. The total action between them is, however, reciprocally proportional to the third power of the distance when the latter is great.

10. Magnetic forces between a suspended magnet and anv mass upon which it acts are proportional to the number of oscillations which (under their mutual action alone) the same magnet makes in a given time.

11. Magnetic forces between a suspended magnet and any magnetic mass are inversely proportional to the square of the time which the suspended magnet takes to complete one oscillation.

12. The attraction of a magnet for an armature is proportional to the square of its free magnetism.

13. The magnetism excited at any given transverse section of a magnet is proportional to the square root of the distance between the given section and the nearest end of the magnet.

14. The free magnetism at any given transverse section of a magnet is proportional to the difference between the square root of half the length of the magnet and the square root of the distance between the given section and the nearest end.

15. The mean horizontal component of the earth's magnetism in England, for 1865, was — 1·764 (metrical) units of force—i. e., a unit pole weighing one gramme, and free to move in a horizonal plane, would, under the action of the horizontal force of the earth's magnetism, acquire, at the end of a second, a velocity equal to 1·764 metres per second.

ELECTRICITY AND LIFE.

MM. Robin and Legros, experimenting with noctilucæ, those little organisms which produce in great part the phosphorescence of the sea, found that on passing a current through some sea-water in the dark, its course was marked by a luminous trace, the phosphorescence of the animals being excited by the electricity.

Induction currents retard or arrest the circulation, by contracting the blood-vessels. Continuous currents, however, generally have an opposite effect. MM. Onimus and Legros have further established the law, that a descending current dilutes the vessels, while an ascending current contracts them. Part of the cranium of a healthy dog was removed; the positive pole of a strong pile connected with the brain, the negative pole with the neck. The superficial vessels of the encephalon were visibly contracted, and the organ appeared to be weakened. On reversing the position of the poles, the opposite effect was observed. By means of an ophthalmoscope, the fine blood vessels on the retina of a living person's eye may be observed; and if the head be electrified, these will be visibly distended.

The effect of an electric current on bodies newly dead was studied by Aldini, who thus produced violent motions in the bodies of guillotined persons. Similarly, Ure experimented in Glasgow on the body of a man that had just been hanged. Using a battery of 270 couples, he connected one pole with the spinal marrow at the nape of the neck, and the other with the heel, whereupon the leg was moved so vigorously as to knock over one of the attendants. He succeeded also in producing motions in the chest, the abdomen and the features of the face.

Recent research has defined the conditions of such influence on the muscles. Continuous currents applied directly cause contractions at the moments of opening and closing; but the shock on closing is much the stronger. While the current is passing, the muscle remains in a state of semi-contraction, the nature of which is not agreed upon by physiologists. Under excitation frequently repeated, and prolonged a certain time, the muscles get into a state of contraction resembling that in tetanus. While in this state they are in constant minute vibration.

Induction currents cause more energetic contractions, but this energy does not last long, and, if the electrification is continued, gives place to cadaverous rigidity. In both the foregoing cases there is a local elevation of temperature, proportional to the force and duration of the electric action. This reaches its maximum (sometimes 4°) in four or five minutes after the electric action has ceased. The muscular contraction disengages heat.

The action on the nerves is more complex. MM. Onimus and Legros state that in the case of motor nerves, the direct or descending current from a battery acts more energetically than the other; the reverse being the case with the sensory nerves. The sensation experienced in these cases (which refer to continuous currents) is insignificant; induction currents, on the other hand, produce a pain, which continues to be felt so long as the nerve retains its excitability.

If a frog is kept some time in tepid water at 40° it dies. If then taken out, and its spinal cord electrified by an ascending current, vigorous contraction ensues; a descending current produces no motion. On the other hand, if the latter be applied to a decapitated animal, in which reflex motions are being caused by the excitation of the spinal cord, it tends to paralyze them.

In general, the battery current applied to a cord, if an ascending one, increases the excitability of this organ, and therefore its power if causing reflex action; the descending current acts in the opposite way.

When the brain is electrified, the animal does not give signs of pain, but of calm stupor, and tendency to sleep. Some have proposed electrification as a means of developing the intellectual faculties; but there is no evidence that it will thus act. On the other hand, extreme care is necessary in electrifying the encephalic parts, as a strong current may produce rupture of the vessels, and serious hemorrhage.

Electricity stimulates all the other organs of sense, producing luminous effects in the eye, sound in the ear, taste in the tongue, odor in the nose.

Applied to the nerves of the nutritive organs, it has the effect of suppressing spasmodic movements which are not subject to the will.

The German theories as to the electrotonic properties of the nerves when electrified were opposed by Matteucci, who urged the obvious phenomena of electrolysis, that is to say, the chemical decompositions caused by the currents. He thought the modifications in nervous excitability produced on the passage of electricity were due to acids and alkalies arising from the decomposition of salts in the animal tissues. To this class of phenomena may be added the electro-capillary currents recently discovered by M. Becquerel.

The effects of electricity on plants have not been so closely studied. It is known to produce contractions in the mimosa and other sensitive plants and to retard the motion of sap. M. Becquerel has studied its influence on germination and development. It decomposes the salts contained in the seed, the acid elements being carried to the positive pole, and the alkaline portions to the negative. Now the former are hurtful to vegitation, while the latter favor it.

M. Becquerel has, further, quite recently examined the influence of electricity on the color of plants. The discharge from a powerful machine produced remarkable changes of color on the petals, due, he thinks, to the rupture of cells containing coloring matter. Deprived of this cellular envelope by washing, the flower becomes white.

An apparatus has recently been devised in Germany for obtaining specimens of water from any desired depth of the ocean. A strong, heavy vessel, entirely closed and empty, has a valve through which water may be admitted, but which is only put in motion by powerful electro-magnets connected therewith. This vessel is lowered to the required depth, and then the electric shock applied. The valve opens, the water rushes in, and the vessel is raised again to the surface.

A Substitute for Flogging.—A writer in the *Pall Mall Gazette* suggests that, instead of the application of the "cat" to the backs and shoulders of garroters and other criminals, as at present practised in London, they should be punished with severe currents of electricity or galvanism, which might be so managed as to give the most intense pain, yet not tear the flesh or break bones.

FOREIGN TELEGRAPHIC ITEMS

ANOTHER TRANSATLANTIC CABLE TO BE LAID AT ONCE.

A telegram, dated Lisbon, Nov. 13, 1872, states that the Government of Portugal has signed a concession to the Falmouth and Malta Telegraph Maintenance and Construction Company, empowering them to lay an electric telegraph cable from Portugal to Brazil.

This enterprise is the same referred to in the JOURNAL upon several occasions, in which the Baron de Mana is mentioned so prominently.

As the Brazilian Government has already made the necessary concession, it is to be presumed that no delay will occur in carrying the project through successfully. The concessionary is to have a monopoly for twenty years, under certain restrictions as to charges, and to have the use of the cable for the succeeding twenty years without monopoly. Contingent upon a certain increase of business, he may be required to lay a second cable. The concessionary may, before 1877, lay cables to the West Indies and Senegal, and may also lay cables along the coast, to points authorized by the Government.

ADVICES from Kingston, Jamaica, of Oct[illegible]th, by steamer St. Thomas, at this port, state that the Colon cable has been successfully laid, but Sir Charles Bright has not yet handed it over to the West India and Panama Railroad Company. He is working it at present for the public with his own staff, at the rate of ten words for five dollars. It is reported that his account against the West India and Panama Telegraph Company amounts to $675,000, and that, until they comply with the terms of his contract, he will hold possession of the Aspinwall cable. It is also stated that the telegraph company has not enough money to meet this demand at present. It is stated that their capital is something less than $395,000, unless they raise money by the issue of new debentures.

A sub-marine cable is contemplated between the present landing place of the Colon cable at Jamaica and Bermuda, to connect with the line which is to be laid next year from England, with an extension to New York. This route will be much more preferable to business men and the press, as they will thereby prevent the objectionable supervision and censorship of Spanish officials in Cuba.

A DESPATCH to the Associated Press, dated Havana, Nov. 11, says: "The impression that telegrams passing through this Island from and to other places are liable to censorship, is not correct. Only despatches originating or delivered in Cuba are subjected to that process."

A CONTRACT has been made by Hooper's Telegraph Works with Messrs. C. Mitchell & Co., shipbuilders, Newcastle-on-Tyne, for the construction of a steamer specially designed for the laying of submarine telegraph cables. This will be the first cable steamer specially built, and it is contemplated that a considerable saving will be effected in the cost of laying future submarine cables by its use. The vessel will be capable of taking 3,000 to 4,000 miles of cable in one length, and will be employed in the submergence of the Great Western Telegraph Company's cable now in progress of manufacture by Hooper's Telegraph Works, and of which about 1,000 miles have passed the tests of Sir William Thomson and Professor Fleeming Jenkin, the engineers of the company.

IN the Cape Parliament (South Africa), a vote of £25,000 has been made for the continuation of the telegraph to the diamond fields.

IN Western Australia a telegraph wire is being constructed between Perth and King George's Sound.

THE work of carrying the telegraph lines through the centre of Australia, from south to north, was performed single-handed by South Australia.

THE completion of the Australian Telegraph Company line is hailed with great joy in Melbourne, and a banquet to celebrate the event is to take place on the 15th inst.

A PRIVATE company has made a proposition to the Spanish Government to construct and maintain at its own expense lines of telegraph throughout the country.

A DESPATCH from Hong Kong, received at London, Nov. 12th, says, the telegraphic cable between that city and Shanghae has ceased to work. The cause of the interruption was unknown.

THE Russian telegraph land lines, connecting with the Nagasaki cable, are out of order through the overflowing of the Amoor river. At last advices the gap was 700 miles.

POST OFFICE TELEGRAPHS.—The total number of messages forwarded from Postal Telegraph Stations in the United Kingdom during the week ending the 12th October, 1872, and during the corresponding week of 1871: Week ending Oct. 12, 1872, 318,995; week ending Oct. 14, 1871, 268,730; increase in the week of 1872, on that of 1871, 51,275.

POST OFFICE TELEGRAPHS.—The total number of messages forwarded from Postal Telegraph Stations in the United Kingdom during the week ending the 19th October, 1872, and during the corrresponding week of 1871.—Week ending October 19, 1872, 313,388; week ending October 21, 1871, 256,377; increase in the week of 1872, on that of 1871, 57,011.

POST OFFICE TELEGRAPHS.—The total number of messages forwarded from Postal Telegraph Stations in the United Kingdom during the week ending the 26th October, 1872, and during the corresponding week of 1871:—Week ending October 26, 1872, 316,166; week ending October 28, 1871, 257,991; increase in the week of 1872, on that of 1871, 58,175.

THE Eastern Telegraph Company, with reference to their announced intention to lay a duplicate cable to Vigo and Lisbon, have intimated that when the cable is laid, early in the ensuing Spring, their tariff to Spain and Portugal will be materially reduced. They are also endeavoring to negotiate with India and other Governments for the adoption of a tariff which will enable the public to pay for the number of words sent, whether one or more, a system which is in successful operation on the Atlantic lines.

DURING a recent session of the Spanish Cortes, Senor Zorilla, President of the Cabinet Council, promised Senor Pascual, who had complained some days before of the wretched condition of the Spanish telegraphic service, that the Government would introduce a bill authorizing 12,000,000 reals to be applied to its improvement and reconstruction.

A PROPOSITION has been introduced in the Cortes to permit the use of cipher words in telegraph dispatches, which has hitherto been forbidden under the censorship.

ANNUAL MEETING OF THE TELEGRAPHERS' LIFE INSURANCE ASSOCIATION.

The annual meeting of the Telegraphers' Life Insurance Association was held at the General Office of the Western Union Telegraph Company, No. 145 Broadway, on the evening of Friday, November 1. We have received the reports of the Treasurer and Secretary; also, the names of the officers elected for the ensuing year, but, beyond this, no account of the proceedings.

The following is the list of officers:

Treasurer.....A. S. BROWN.
Secretary.....D. R. DOWNER.
Executive Committee.....GERRITT SMITH, A. B. CHANDLER, W. K. APPLEBAUGH.

The reports render a good financial exhibit.

Treasurer's Report.

NEW YORK, Nov. 1, 1872.

The following is respectfully submitted as the report of the Treasurer for the year ending November 1, 1872:

The present incumbent has held the office since the first of April last. At that time the retiring Treasurer presented a statement, showing a balance in the treasury of two thousand seven hundred and fifty dollars and forty-two cents, . . . $2,750 42

The receipts since that date have been as follows:

From 164 new certificates, numbers 1,513 to 1,676, inclusive,	246 00
Received from the Secretary an account of assessments,	6,192 09
Interest on deposits,	63 34
Total,	$9,251 85

The disbursements during the same period have been:

Paid to the heirs of G. H. Patriquin,	$792 00
" " " T. L. Brown,	882 00
" " " Jno. Grant,	872 00
" " " E. Sammis,	886 00
" " " R. Waterman,	869 00
" " " L. Q. Judge,	896 00
" " " F. A. Randall,	969 60
Postage, and printing assessment notices,	76 44
Stationery,	7 25
Refunded to C. A. Gaston, Memphis, by order Ex. Com.,	3 50
Secretary's and Treasurer's services,	79 34
Paid G. G. Small, for services in transferring names and accounts in Secy's books,	13 00
	$6,346 13
Leaving a balance in the Treasury,	$2,905 72

Of this amount there is payable to the heirs of Andrew Ainsworth an Assessment, No. 32, ... 911 00
Returns from Assessment No. 33, ... 896 00
Advance payments on Assessments, ... 195 00
Credited to the Reserve Fund of the Association, . . 903 72
$2,905 72

The Reserve Fund, above mentioned, has accrued partly from initiatory fees, but chiefly from the payment, by members, of assessments long over-due. As this fund is steadily increasing in amount, the disposition to be made of it becomes an important question. It has been suggested that it might be used to pay some future assessment, thereby releasing the members from the payment of the usual fee. If this course is adopted, it would be well to empower the Executive Committee to decide when the fund shall be so applied,

Nearly a year ago, President Orton, on behalf of the Western Union Telegraph Company, agreed to pay to the heirs of such deceased members of this Association as were, at the time of their death, in the employ of the Company, the sum of one hundred dollars. This sum has accordingly been paid to the heirs of C. A. Kellogg, Miss E. Sammis and F. A. Randall. This generous action on the part of the Company has greatly aided in extending our membership among Western Union employees, and the propriety of some acknowledgment from this meeting to the Company hardly needs to be suggested.

Respectfully,
A. S. BROWN, Treas'r.

New York, Nov. 1, 1872.

Secretary's Report.

NEW YORK, November 1, 1872.

The Secretary respectfully presents the following Report for the year ending October 31, 1872:

Digitized by Google

Total number of Certificates issued by the Association to November 1, 1871		1255
Total number of Members in good standing	758	
Showing a loss—from all causes, since the organization of the Association—of . .	497	1255
Number of New Members added during the year	421	
Number of Members in good standing—previous Report, Nov. 1, 1871	758	1179
Losses during past year: Resignations .	3	
Non-payment of Dues,	187	
Deaths, . . .	11	201
Leaving in good standing, Oct. 31, 1872, . .		978

DEATH LIST:

No. of Assessment.	No. of Certificate.	Name.	Date, 1871.	Place.
24	947	Christopher Reynolds..	Nov. 6. 1872.	Gohen, N. Y.
25	180	Chas. A. Kellogg.....	Feby. 3.	Rochester, N.Y.
26	1185	Geo. H. Patriquin.....	Feby. 29	Tatamagouche, N. S.
27	446	Taylor L. Brown.....	Mar 3.	Athens. Tenn.
28	910	John Grant (of Canada)	Mar 3.	Atlanta, Ga.
29	209	Miss Emma Sammis..	Mar 17.	Brooklyn, N. Y.
30	528	Richard Waterman....	April 8.	Lafayette, Ind.
31	1258	Miss L. Q. Judge.....	June 23.	Brooklyn, N. Y.
32	726	Frank A. Randall.....	Sept, 13.	Ann Harbor, Mich.
33	850	Andrew Ainsworth....	Sept. 16	Greencastle, Ind
34	121	Chas. H. Baker.....	Oct. 26	Baltimore, Md.

There were eighteen (18) delinquent members reinstated during the year, all of whom furnished new health certificates, and paid up "back dues," as required by the Association.

The loss of small remittances through the Mails has been a source of great annoyance to members living at stations where they were unable to procure Postal Money Orders. During the early months of the present year the complaints of this nature were so numerous that it was deemed advisable to investigate, as thoroughly as possible, the cause of such losses. The facts were placed in the hands of a special agent of the Post Office Department in this city, who watched the incoming remittances for several weeks, without discovering the loss of any letters after they reached the General Post Office. It is a noticeable fact, however, that the complaints have been very few since the investigation was made.

It has been discouraging to many, who were compelled to remit twice for the same assessment, and is, doubtless, the cause of many allowing themselves to become delinquent. In cities and large towns, where he members have selected one of their number to act as a local agent, to attend to the collection and forwarding of remittances, there is scarcely ever a delinquent. It is suggested, that if the Executive Committee be authorized to form districts, and appoint a local agent for each district—such agent to receive applications, collect dues and attend to all other matters pertaining to the Association—there would be less liability to loss of remittances, and, consequently, a material reduction of the "Delinquent List."

It is to be regretted that many members change their residences without notifying the Secretary, causing their assessment notices to go astray. This would be obviated by the formation of local districts, as the agent could promptly notify the Secretary of any changes.

W. K. Applebaugh, Sec'y.

INFORMATION WANTED.

Information is wanted as to the whereabouts of Seymour Owen Nichols. He was last heard of in March, 1872, in the employ of the Western Union Telegraph Company, as an operator, at La Salle, Ill. His mother is dead, and his family are very anxious concerning him. Any one having knowledge, however indefinite, which will afford a clue to his present position or condition, will confer a great favor by communicating the same at once to this office.

Western and Southwestern papers please copy.

Notice has been issued in London that the half yearly coupon No. 1, due 1st November next, on the Western Union Telegraph Company's seven per cent. first mortgage building bonds, will be paid at the fixed exchange of 4s. per dollar, equal to £7 per coupon (less income tax), by Messrs. Grant Brothers & Co.

The Eastern Telegraph Company has determined, in consequence of its increasing business, to lay a duplicate cable from Falmouth to Lisbon, connected with either Corunna or Vigo.

RESIGNATION OF VICE-PRESIDENT PALMER.

It is with great regret that we announce the resignation of Judge O. H. Palmer, Vice-President of the Western Union Telegraph Company. For many years Judge Palmer has been prominently identified with the Western Union Company, always filling an office of the highest honor and importance.

Prior to 1862 he was one of the first among the members of the Bar of Monroe County, New York, and was at one time judge of one of the courts in the Western part of the State.

Early in that year he was appointed Colonel of the One Hundred and Eighth Regiment, New York Volunteers, and, in obedience to his patriotic impulses, at once abandoned his lucrative practice and left with his command for the seat of war in Virginia. During his period of service in the army he acquitted himself with much credit, never flinching in the face of danger, and was in command of a brigade on the bloody field of Fredericksburg.

In 1863 he was honorably mustered out of the service and returned to his home at Rochester, only to find his once flourishing business broken up. About this time the melancholy death of Mr. Isaac R. Elwood, Secretary and Treasurer of the Western Union Telegraph Company, rendered that office vacant, and it was tendered to Judge Palmer. Eight years' service in that position has rendered the name of O. H. Palmer one of the best known in the telegraph business in America. He had found his true vocation. The course of his career during this period may be summed up in a few words. It is enough to say that he is one of that band of able men, who, while not actually assisting at the birth of the Western Union Company, yet brought it from a comparatively feeble and obscure state to be what it now is—the best managed and most successful private corporation upon the face of the globe.

In 1871 General Palmer was elected one of the Vice-Presidents of the Western Union Company, and was re-elected in 1872.

He resigns to assume the position of Chief of the Law Bureau of the Mutual Life Insurance Company of the City of New York, a position for which his legal acquirements eminently qualify him, and in which, it is to be hoped, he will find comparative freedom from the incessant care and toil incident to his present duties.

SUBSCRIPTIONS EXPIRED.

We once more call the attention of those whose subscriptions expire with the present issue of the Journal to the fact that unless their subscriptions are renewed the paper will be stopped. Remit at once, and so save us the trouble of forwarding back numbers.

Mr. David Brooks, patentee of the Brooks's Paraffine Insulator, is not going to fail in business for want of advertising. His new advertisement, displayed upon our last page, fully sets forth the merits of his Insulator, which, we are glad to hear, is giving perfect satisfaction to every person using it. That this must be so is evident from the fact that his customers in 1872 number twice that of any previous year.

Attention is called to the advertisement, in this issue, of the Electrical Construction and Maintenance Company of San Francisco. An excellent opening for first-class workmen on telegraphic machinery is there offered.

ATLANTIC CABLE BUSINESS.

The attention of managers of offices is called to the fact that some important changes have occurred in the mode of counting Atlantic Cable business. Also note the fact that the rules which heretofore applied only to Continental business now applies likewise to Great Britain.

Notice the method of counting words where hyphens or apostrophes are used. Also the rate for repeating messages and the rate on cipher business.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

Executive Office,
Western Union Telegraph Company,
145 Broadway, New York,
November 15, 1872.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular.

GENERAL INFORMATION.

Communications relating to checks, or otherwise, with Norwood, N. J., Catskill Mountain House, N. Y., Cornwall, N. Y., Lake George, N. Y., Lake Mahopac, N. Y., Lebanon Springs, N. Y., and Clarendon Springs, Vt., (Summer offices now closed), should be addressed to A. B. Chandler, District Superintendent, 145 Broadway, New York City.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is 6,500. It goes to every State, Territory and Province on the Continent. It is fast becoming a necessity, and is already welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

FOUR DOLLARS FOR FIVE COPIES.

Address—

JOURNAL OF THE TELEGRAPH,

Western Union Telegraph Company,

145 Broadway, New York.

NEW YORK, NOVEMBER 15, 1872.

THE GREAT FIRE AT BOSTON.

The great fire at Boston afforded an opportunity to the employés of this Company to show what activity and intelligence, combined with the resources at their command, can do to mitigate the evils of a great disaster, in furnishing abundant and prompt means of communication. Although the fire interrupted all communication with the principal offices in that city at an early hour on Sunday morning, and the destruction of the prineipal office was so imminent that the office furniture and apparatus were removed for safety, yet telegraphic communication with Boston continued uninterruptedly, the messages being received at and delivered from the various railway stations, at which the Company already had offices. Communications sent to and received from the Atlantic Cables were sent via Portland and Montreal until the temporary interruption at Boston was removed. At an early hour Sunday morning, Gen. Eckert, the General Superintendent of the Eastern Division, came to the main office in this city, and immediately took vigorous measures for reconstructing the lines and offices at Boston. Men and material were promptly dispatched from Portland, White River Junction, New York and other places. A special train left this city for Boston at 7 o'clock with material, and at 9 o'clock a sleeping car containing Gen. Eckert, Manager Brown, Mr. Mackintosh, foreman of repairs, with a corps of line-men and a dozen operators, also started for the scene of disaster.

On Monday morning operations were resumed upon a limited number of wires at the general office in Boston, and during the day all of the wires but two were working from the general and branch offices. In the meantime, there was an immense amount of telegraph business performed by the Company. Over twenty thousand paid messages were sent on Monday from the principal office in this city. All the facilities of the Company were called into requisition for expediting the business. During the past week, Stearns' Duplex Telegraph has been of the greatest value to the Company, and particularly upon the wires between this city and Boston, where four sets are in operation. Previous to the fire but two sets of the Duplex were worked between these points, but on Monday afternoon it became evident that four sets could be used to advantage. As an illustration of the facility with which the means of communication may be multiplied by utilizing this apparatus, a single fact may be mentioned: at 3 o'clock on Monday afternoon, a request was made from Boston that two additional sets of Duplex be forwarded that night—the instruments were promptly packed and sent by Adams Express, and were delivered in Boston at 8 o'clock the next morning. At 9 o'clock the instruments were ready for use. Thus, in the space of eighteen hours, the instruments were transported a distance of 250 miles, put in operation, and two wires were thus practically converted into four. The four sets of Duplex which have been operated between this city and Boston, during the past week, have practically given us four extra wires between these two cities. If the Company possessed Aladdin's wonderful lamp, it is very much to be questioned whether the genii who obeys the mandates of its owner could double these facilities with any more promptness than they were achieved by the use of Mr. Stearns' magical apparatus.

In alluding to the assistance rendered to Boston from this city and elsewhere, we should not forget to mention the earnest, energetic, and intelligent services performed by the company's employés at Boston. Mr. Wood, the Superintendent of the District, and Mr. Milliken, Manager of the Boston office, were early on hand, and rendered most efficient service, as did also Mr. Raymond, foreman of repairs. Superintendent Gates, of White River Junction, and Superintendent Bedlow, of Portland, arrived on Monday morning with gangs of men, and performed valuable services in the reconstruction of the lines. Where all the employés of the Company have done well, it is unnecessary to make especial commendation. In this case every one seemed to have tried to do his best, and the result has been such as to reflect great credit upon the Company.

CLOSE OF VOLUME V.

With the present issue, Volume V. of the JOURNAL OF THE TELEGRAPH is brought to a close.

Originally established mainly as a medium for communicating to the employés of the Western Union Telegraph Company the various orders and regulations necessary to a proper conduct of the service, and, in its infancy, hardly venturing further, the JOURNAL has, from year to year, steadily progressed in all those essentials which render the press leaders in the march of ideas, until now, while still performing the service for which it was established, it stands among the first of the scientific journals of the day.

The attention of the readers of the JOURNAL need scarcely be called to the manifest superiority in contents appertaining to its speciality, over any contemporary in the world. There is no publication in Europe, which, like the JOURNAL, is devoted entirely to the interests and education of the telegraph employé, and certainly none in America approaching it in the real benefit sought to be bestowed upon the telegraphic fraternity. During the past six months the JOURNAL has endeavored to instruct its readers and to render them familiar with the immense strides which electrical science, and the telegraphic art, have taken. To this end no labor nor expense has been withheld, and the result has justified the effort. The evidences of appreciation are not to be mistaken. Subscriptions are pouring in at an unexampled rate. Telegraph operators and others have come to regard the JOURNAL as an essential to their progress, while all classes welcome it as a friend. While so much has been done in the past to make the JOURNAL worthy of the support and appreciation of the large and intelligent class of telegraphists in the United States and British Provinces, we intend that the future shall show a still greater advance in this direction.

We observe, with much gratification, the lively interest shown in the large number of communications daily received from all sections of the country. Many more are promised, some of which will treat upon matters of much interest to the profession. The latent talent existing in the minds of many of our readers is awakened and the fruits thereof will shortly be enjoyed.

The mission of the JOURNAL is not to break up and destroy, where destruction would involve all in common ruin, but rather to enlarge and excite ambition where the fulfilment and gratification of honest and earnest endeavor will result beneficially to all; to none more than to the seeker for knowledge and advancement.

In the journalistic year, which is about to commence, much can be, and will be essayed by the JOURNAL for the general good of the fraternity, but more can be done in this direction by almost any one of its readers than by ourself. There are in the telegraphic ranks of this country many intellects of the first order, who need nothing but an encouraging word and welcome to place their light where it can be seen. This talent we are going to develop, and in its development meet our reward in increased interest and influence in the direction we place the most value—the judgment and reason of our readers.

Pecuniarily, the JOURNAL is owned by the Western Union Telegraph Company, but morally it is the property of the Company's employés. Every article written for, and appearing in its columns appears for their benefit and instruction. Let all therefore recognize this fact, and resolve to assist us in our efforts to retain the present standing and to advance still higher. Such endeavors can have but one result, and that will be—mutual benefit.

ATLANTIC CABLE.

RULES FOR ATLANTIC CABLE BUSINESS.

To go into effect December 1, 1872.

This order contains complete instructions concerning the treatment of Atlantic Cable Business, and supersedes all previous orders relating thereto.

GENERAL CONDITIONS UPON WHICH MESSAGES ARE ACCEPTED BY THE CABLE COMPANIES.

(1). The Companies owning the Cables to America will not incur or accept any liability whatsoever, either for the due transmission of Telegrams to the Cables, or for their safe delivery at their destination; nor will they accept any liability arising from delay or stoppage by reason of any accident to the Cables or instruments, or from errors caused by indistinct handwriting, nor will they consent to be liable, under any circumstances, for any sum whatever, as damages or otherwise, from loss resulting from errors, mistakes, delays, mis-delivery, non-delivery, or other causes in respect of any message entrusted to them, beyond the return in the case of repeated messages, and under certain circumstances, of the amount paid for transmission.

(2). Messages are classed in three categories :—

1st. Government messages : those which emanate from the Chief of the State, Ministers, Commanders-in-Chief of Land or Sea Forces, and Diplomatic or Consular Agents, and also the replies to such messages.

Messages from Consular Agents, who are engaged in commerce, are not considered as Government messages, except when they are addressed to an official personage and when they relate to official affairs.

Government messages must be properly authenticated by the person who proffers them for transmission.

2nd. Service messages : those which relate to the service of the line.

3rd. Private messages.

Ordinary private messages are those composed of words alone, or words, figures and letters combined, so placed that their meaning is evident to the clerk who accepts them from the sender.

Code messages are composed of words which though not conveying any consecutive meaning can be found in ordinary dictionaries or gazetteers.

Figures may be used in code messages if the sender can show that they have not a secret meaning.

Cipher messages are composed either wholly or partly of figures or letters, or of a combination of words and figures, words and letters, or words, figures and letters, constructed for the purpose of concealing the meaning and intention of the sender, or of words not to be found in dictionaries or gazetteers.

Any message containing such combinations, either wholly or in part, will be treated as a cipher message and charged as such.

Messages may be forwarded in any language in which Roman characters are employed.

GENERAL INSTRUCTIONS FOR CHARGING AND COUNTING MESSAGES.

(3). *All Messages to be Prepaid by the Sender.*—The "word system of charging" has been adopted for messages originating in the United States, British Columbia, Canada East and West, Newfoundland, Nova Scotia, New Brunswick, Prince Edward's Island, and Cape Breton, and destined to Great Britain and Ireland.

A single message between the above places may contain any number of words at the option of the sender, who will be charged "by the word" at the ordinary tariff price for the time being.

The Companies do not insist upon the insertion, either of the "*name from*" or the "*place from*" in messages to Great Britain and Ireland, but should complications arise with Receivers, on account of the omission of those words, the Companies decline to make any unpaid enquiries respecting them. The "place from" must be inserted and paid for throughout in messages to points *beyond* Great Britain and Ireland; and to points in India and beyond, the sender's signature is also required.

(4). The maximum length of a word is fixed at seven syllables ; any excess is counted as a word.

Words joined by a hyphen are counted as so many separate words.

Words separated by an apostrophe are counted as so many separate words.

Proper names of persons, names of places, squares, streets, &c., titles, Christian names, particles, and qualifications, are counted for the number of words employed by the sender to express them.

Names, such as Dezeug, Delarue, Vonhoffman, if written together count as *one* word, if written separately as De Zeug, De la Rue, Von Hoffman, they are reckoned and charged as separate words.

F. O. B. and *C, F, I.*, when written as separate letters, are each counted as Three words, but when written "*fob*," "*cfi*" as One word.

Twopence, threepence, up to elevenpence, written as a single word, count as One word in each case.

Names of countries, principalities, states, islands, cities and towns, if written as one word, count as One word. For instance, *Novascotia*, *Southcarolina*, *Princeedwards*, *Newyork*, count in each case as One word only ; if written separately, or divided by a hyphen, they count as separate words.

In case it is not certain that a combination of words employed by the sender is contrary to the usage of the language, the sender's manner of writing regulates the counting.

Numbers expressed in figures are counted at the rate of five figures to a word, plus one word for any excess. The same rule applies in counting groups of letters.

Every separate character, whether letter or figure, is counted as a word. The same applies to an underline.

Initials before surnames are considered as separate letters, and each one is counted as a word.

Signs of punctuation, hyphens, apostrophes, inverted commas, parentheses, fresh paragraphs, are not counted.

Decimal points, commas, and bars of division used in the formation of numbers are each counted as a figure.

Letters added to figures to form ordinal numbers are each counted as a figure, thus, 129th is counted as five figures, or one word.

The following examples, the principal of which have been extracted from the Convention of Rome, determine the interpretation of the rules to be followed in counting words and figure quotations in messages which are expressed in plain language :—

Irresponsibility (7 syllables)	1	word.
Unconstitutionality (8 syllables)	2	words.
Aujourdhui (without an apostrophe)	1	"
Today (without hyphen)	1	"
C'est-à-dire	4	"
That's to say	4	"
J'ai	2	"
I've	2	"
Aix-la-Chapelle	3	"

Emvt (‡)	1	"
Tmrlzk (‡)	2	"
The matter is urgent ; leave at once. (7 words and 2 underlines)	9	"

(*) The oblique stroke meaning shilling is considered and transmitted as *s*, on the European lines.

(†) If an oblique stroke is used to divide a group of figures which does *not* mean shilling, then it counts as a figure.

‡ Illustrations of the manner of counting groups of or continuous letters in messages.

Cypher Messages.

(5.) In messages containing secret language the address, signature, and portions of the text expressed in ordinary language, or in words of preconcerted meaning, are counted in conformity with the preceding article, and are added to the number of words found in the cypher text.

The portions of the text composed either of figures, or secret letters, or of a language inadmissible under Article 2, are counted as follows :

All the characters, figures, letters or signs are added together. The total is divided by five, and the quotient (plus one for the remainder if there be any) gives the number of words to be charged for. The signs which separate the groups are counted unless the sender expressly requests that they be not transmitted.

The charge for such message is the same as for a "repeated message."

Delivery of Messages at their Destination.

(6.) Messages should be addressed either to the residence or place of business of the receiver ; they may also be addressed to the Post Office or Telegraph Office till called for.

Messages addressed to the residence or place of business of the receiver, or to the Post Office or Telegraph Office till called for, at places beyond the limits

Digitized by Google

of foot delivery, are at once despatched to their destination, either by post or (if the sender desires) by a more rapid means of conveyance, if available.

The charge for delivery by express (man and horse) is $3.13 for every five miles (English) or fraction of five miles; this charge must either be prepaid, or payment must be guaranteed by the sender. The words "Express from . . . ." must be inserted immediately after the receiver's address, and will be charged for.

If on account of insufficiency or incorrectness of address, absence or refusal of receiver to accept a message, the expenses incurred in delivering it by Express cannot be obtained, they must be paid by the sender.

The sender is responsible for an incorrect or insufficient address; corrections and alterations can only be made by a fresh message, which must be paid for.

Paid Service Messages.

(7.) Every message forwarded by or at the request of the sender or receiver, to rectify or complete a message already in transit, and generally every communication exchanged with a telegraph office relative to a despatch transmitted or in course of transmission, and also the replies to such messages, will be charged for at full rates. The sender or receiver of a message, can have any passage or passages in his message corrected, which may appear to him doubtful, provided his application for such correction be made within twenty-four hours after the departure or arrival of the message respectively.

The charge for this service is as follows:

If the sender makes the application, he must be charged the price of a message calculated according to the length of the passage to be corrected, and he must also deposit the price of a message of ten words, in payment of the service message returned to announce that the correction has been made.

If the receiver makes the application, he must be charged the price of a message necessary to ask for the correction, and also the price of an answer, calculated according to the length of the passage to be corrected.

These charges will be refunded to the person who paid them, if it be found upon receipt of the repetition, that the Telegraph Service has been in fault.

No return of charges will be made upon the original message, corrected by a paid service message.

Prepaid Replies.

(8). Replies at full rates can be prepaid, the sender determining the number of words, and inserting, and paying for the following words immediately after the receiver's address. "*Reply words paid.*"

Replies must not contain more words than the number paid for by the sender at the original station.

Should the reply contain more than the number of words specified and paid for, the sender of the reply must pay for it as a fresh message, at the ordinary tariff rates; and in such cases the amount deposited for the reply by the sender of the original message will be refunded to him, if it is ascertained on investigation at headquarters, that the reply is fully paid for by the sender thereof.

If the original message cannot be delivered, or if the receiver formally refuses to send a reply, the delivery station will inform the sender of it, by a telegram which takes the place of a reply.

This telegram will indicate the cause of non-delivery, and, when requisite, will give the information necessary to enable the sender to order his message to follow the addressee.

Prepaid replies must be tendered not later than eight days after the date of arrival at the delivery station. Should they be presented *after* the expiration of eight days they must be paid for as ordinary messages.

Amounts deposited to prepay replies must be entered in account, and remitted as a part of the tariff upon the original message; and must not, under any circumstances, be refunded without instructions from headquarters.

Messages to which a reply is prepaid must not only contain the words, "Reply, —— words, paid," as a part of the message, but *must show in the check* the amount thus prepaid. For example: A message of ten words, from Virginia to London, to which a ten word reply is prepaid, must be checked thus: "10 paid, $11.50, and $11.50 for reply."

Replies which have been prepaid, must be checked in the following manner: "10 collect, $11.50—prepaid reply to No. —— of 28th."

Repeated Messages.

(9.) The sender of an ordinary private, or code message, if he desires, may have it repeated, in which case the various offices en route repeat it to each other as it passes.

The charge for repetition is equal to *half* the charge of the message, in addition to the ordinary tariff rates paid for its transmission.

The words "*Repetition Paid.*" must be inserted immediately after the address, and will be charged for.

Repetition at the foregoing rates is compulsory for cipher messages.

Acknowledgment of Receipt.

(10.) The sender of any message may request that a notice of the time, at which it is delivered, be transmitted to him by telegraph.

If the message cannot be delivered, the terminal station informs the original sending station of it, by a notice containing, if requisite, the information necessary to enable the sender to cause his message to reach its destination. When there is no telegraphic error to be corrected, this notice takes the place of the acknowledgment of receipt.

The sender can have the acknowledgment of receipt addressed to him at any point of the territory of the Contracting States on furnishing the necessary instructions.

The charge for an acknowledgement of receipt is equal to that of a message containing ten words.

The words "acknowledgment paid" must be inserted immediately after the receiver's address, and will be charged for.

Government Messages.

(11.) American, English and French Government messages will be charged half rates between New York and Great Britain or France; that is—messages in plain language, will be charged half ordinary public rates, and messages in cypher, half cypher rates. Beyond New York and beyond Great Britain and France, full rates must be charged.

Messages of other Governments will be charged full rates.

Characters.

Note the following characters used by the Cable Companies:

For a horizontal dash, ——— - - - - ———

For a perpendicular dash, - - ——— ———

Complaints.

(12.) All complaints respecting irregularity in the transmission or delivery of messages must be made by the *Sender* only, and addressed to the administration or Company to which the messages are handed.

The charges made for messages will be returned under the following circumstances:—

1st. The total charge of any message which has failed to reach its destination, or which has been seriously delayed through the fault of the Telegraph service.

2nd. The total charge for any *repeated message* which, on account of errors in transmission, has manifestly failed to attain the object the sender had in view.

3d. In case of interruption to a submarine line the sender of a message has a right to the return of the charges accruing to that portion of the route which, on account of the interruption, has *not* been traversed, after deduction has been made of the expenses incurred in forwarding the message by the best means possible to its destination.

4th. Complaints made by senders must be accompanied—

1st. By a declaration in writing from the Receiving Station, or the receiver, if the message has not been delivered.

2d. The receiver's copy of the message, if it has been mutilated or seriously delayed.

5th. The sender of a message, who does not reside in the country from which it was forwarded, may present his application at the office of origin, *through* the intervention of another office; in which case, should the application be entertained, the sender will receive his money back from the office to which he has made his application.

6th. In case of delay, the sender has an absolute right to the reimbursement of the charges, in the event of his message not arriving at its destination sooner than it could have been sent by post.

7th. Every claim should be made under penalty of rejection, within *six months* of the date of the message.

Managers are specially instructed that all claims for refunding of tolls on cable messages, must be forwarded to the Secretary, at New York, with statement of complaint, as above. The tolls will in no case be refunded, without instructions from headquarters.

(13.) Messages destined to points beyond Great Britain and Ireland, are forwarded by the cheapest route, unless specially directed by any other. When there is more than one route to the same place at the same charge, and messages are not specially directed, they are forwarded by the best route at the discretion of the Telegraph Officials. The indication of route is charged between America and London or France. Beyond London and France it goes free. Messages destined for places to which there is no telegraph communication, must contain the name of the place from which they are to be posted. The charge for postage is 37 cents."

(14.) *Check.*—You will state in the cheek:

1. The number of words in the entire message, including address, date and signature.

2. The amount charged.

Count.—The address, signature and date (if message is dated) must be included in the count and charged for.

Should the sender omit the "place from," It must be sent with the check.

In addition to the above we are notified that the route *via* Russia to Hong Kong and Shanghai is again open, the rate from London to Shanghai and Niagasak by that route being $21.50 for twenty words; half rate for every ten or fraction of ten additional words.

ATLANTIC CABLE BUSINESS

Will *not* be included in the regular monthly Account Current and Check Report. Keep an entirely distinct and separate record thereof, and at the end of each month forward promptly to the Auditor at New York.

First. A detailed statement of Sent Business, showing date, address and signature of each message, number of words, and amount collected.

Second. A detailed statement of Received Business, giving same data, omitting amount.

Third. The original of all messages sent, *and copies of all messages received.*

CUBA CABLE BUSINESS

Must be kept in the same manner as the foregoing, but separate from Atlantic Cable Business.

REMITTANCES.

Remit weekly to the Treasurer at New York the entire amount of gold collected, with written statement showing how much for Atlantic Cable, how much for Cuba Cable, with dates of messages.

The tariff to Greece and St. Maurice, via Corfu, was incorrectly given in last Journal. Greece via Corfu should read 334 St. Maurice, via Corfu, 358.

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 1. NEW YORK, DECEMBER 2, 1872. WHOLE NO. 122.

THE ELECTRICAL DOUBLER.

The purpose of the Electrical Doubler is to increase the least conceivable quantity of electricity by continually doubling it, until it becomes perceptible upon a common electrometer or made visible in sparks.

The principle involved in the construction of the Doubler will be best understood by explaining the first device of this kind, invented by Mr. Bennet. This apparatus consisted of a circular brass plate three or four inches in diameter, polished and thinly varnished on the upper surface, upon which was placed another brass plate of equal diameter, polished and varnished on both sides, with an insulated handle attached to one edge of it. A third plate was also provided, of equal diameter, polished and varnished on the under side, and with a perpendicular insulating handle extending from the centre of the upper side. Its mode of operation is as follows:

Electricity is communicated to the under side of the first plate and the second plate is touched with the finger. The second plate is then removed from the first by its insulating handle and the third plate

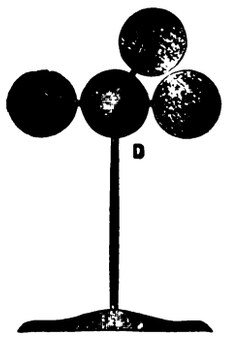

Fig. 1.

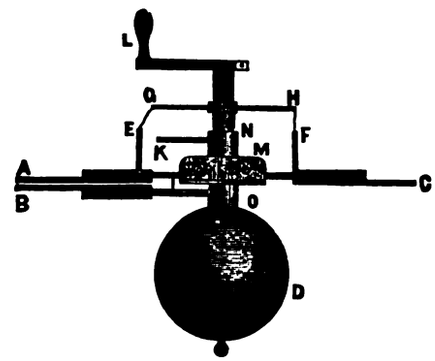
is placed upon the second. The third plate is then touched by the finger and then separated from the second. In this situation it will be apparent that two of the plates are charged with one kind of electricity, and of nearly equal quantity, and one of the plates with the other kind of electricity. The third plate is now touched to the under surface of the first plate, the first plate being covered by the second, and the second plate is touched by the finger. If now the third plate is removed, and the finger withdrawn from the second plate and the latter is lifted up from the first plate, the electricity becomes doubled. This process may be repeated ten or twenty times, and by doubling the quantity of electricity every time the smallest conceivable amount can be made visible, since at the twentieth operation it is increased 500,000 times.

In order to avoid the labor of the preceding operation, Dr. Darwin invented the movable doubler, consisting of four metallic plates moved by wheel works, but requiring to be touched by the hand in order to produce the effect. This apparatus has been superseded by Nicholson's Revolving Doubler, which is represented by figures 1 and 2. The instrument is supported on a glass pillar 6½ inches long, and consists of two fixed plates of brass, A, C, two inches in diameter, separately insulated and placed in the same plane, so that a revolving plate, B, may pass near them without touching. A brass ball, D, two inches in diameter, is fixed on the end of the axis that carries the plate, B, and is loaded within at one side to act as a counterpoise to the revolving plate B, so as to keep it at rest in any position. The axis, P, O, is made of varnished glass, and so are axes that join the three plates with the brass piece M, which supports the plates A and C. At one extremity of this axis is the ball D, and the other is connected with a rod of glass N O upon which the handle L is fixed, and also the piece G H separately insulated. The pins E, F rise out of the back of the fixed plates A, C, at unequal distances from the axis. The piece K is parallel to G H, and both of them have their ends armed with small pieces of steel wire that they may touch the pins E, F in certain points of their revolution. In the piece M, there is fixed a pin I, which intercepts a small wire proceeding from the revolving plate B.



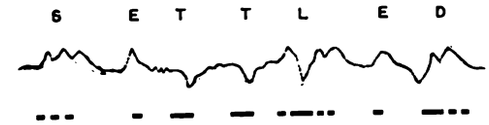


Fig. 2.

These wires are so adjusted by bending that when the plate B is exactly opposite to D, the piece G-H connects the two fixed plates while the wire and pin at I form a connection between the ball D and the plate B. On the contrary, when the plate B is exactly opposite to the plate C, the ball D becomes connected with C by the contact of F with the wire at K, the plates A and B being then completely unconnected with any other part of the apparatus. In all other positions the three plates and the ball will be perfectly unconnected with each other.

THOMSON'S SYPHON RECORDER.

The accompanying cut is a *fac similie* of a portion of a message received over one of the Atlantic cables, and recorded upon a ribbon of paper by Thomson's Syphon Recorder. The signals are similar to those made by the Refracting Galvanometer. The alphabet employed is the same as that used upon all the Morse, Needle and bell telegraphs in Europe, and is similar to that of the Morse Alphabet. When used in connection with the Mirror Galvanometer, where a spot of light is thrown from a mirror upon a shaded screen, a movement of a spot of light to the left indicates a dot and a movement to the right a dash. When recorded upon paper by Thomson's Syphon Recorder the upper points represent dots and the lower points lines.

The Syphon Recorder consists of a movable coil of very fine wire, suspended between the poles of a powerful horse-shoe magnet, a syphon of extremely thin glass tube, machinery for moving a band of paper, an insulated vessel filled with common ink, and an electric doubler. The insulated vessel filled with common ink is placed in front of the coil. One end of the syphon dips into the vessel filled with ink, while the other end of the syphon is bent horizontally and faces the paper ribbon. The syphon is so arranged as to be free to move in a direction at right angles to the length of the paper, and consequently if the ink is caused to issue from the syphon with sufficient force a line will be traced upon the ribbon, and if the syphon itself is moved from side to side angular lines will be made across the paper. If alternate positive and negative signals are sent through the cable the coil will be deflected from side to side, and will move the syphon by means of a

thread connecting them. The ribbon of paper being drawn forward by clock work, the movements of the coil will be recorded on the paper. The spurting of the ink is necessary for the purpose of avoiding friction on the surface of the paper, and is effected by electrical repulsion, the ink vessel being charged to a high potential by means of an electrical doubler driven by an electrical magnetic engine.

GOVERNMENT monopoly of the telegraph receives the following quietus in the columns of the New York *Commercial Chronicle:*

"Telegraphs, like railroads, must be left to private enterprise. These great public enterprises require trained men, not political wire-pullers, to manage them with economy and success. Sixty thousand officials are, it is said, appointed by the Government now, and the nation cannot consent to make the number seventy thousand. We trust the mischievous scheme will not be pushed in Congress. The leading newspapers will not venture to brave the almost of public obloquy which would certainly be awakened by such an attempt to enlarge the means and temptations to political corruption. It is true that governments abroad own telegraphs. But that is nothing to the purpose. Foreign Governments do many things which we cannot, dare not, must not do—things that require a centralization of power, and are incompatible with our freer institutions."

ON THE CONSTRUCTION AND SUBMERSION OF SUBMARINE TELEGRAPH CABLES.

By Professor Fleeming Jenkin, C.E., F R.S., &c.

All submarine cables hitherto laid have consisted of three parts: 1. The conducting wire, generally, if not universally, copper. 2. The insulator surrounding the conductor, generally gutta percha, or some preparation of india rubber. 3. An outer covering intended to afford protection, and give longitudinal strength. The simplest form of outer covering consists of iron wires laid helically over a jute or hemp serving.

Conductor—Copper, being the metal which offers less resistance to the passage of the current than any other commercially available, is employed in all but a few exceptional cases. The earliest cables had conductors formed of a solid wire, which has the advantage of occupying less bulk than any strand, and so requiring less insulating material to give the same thickness of coating. This advantage was more than counterbalanced by the brittleness of the solid core, which breaks after being bent a few times, and from this cause frequently caused total interruption of telegraphic communication. A strand of 3 or 7 wires is therefore now universally used. Messrs. Clark and Bright introduced a strand made of wires of such section as to fit into one another, building a truly circular rope, and thus endeavored to combine the advantage of the strand and solid wire. Many have been unable to carry this plan to any commercial advantage. The strength of copper wire is given in some books as equal to 60,000 lbs. per square inch, but the one used in submarine cables is chosen rather for electrical than mechanical properties, and will bear only from 35,000 to 39,000 lbs. per square inch. It elongates from 10 to 15 per cent., or even more, before breaking, so that its full strength cannot be made use of; but this extensibility is a very valuable property, since it ensures that the conductor shall not break before the full strength of the protecting cover has been made use of and overcome. A copper strand will bear 1¼ lb. per pound weight per knot before breaking. It will stretch 1 per cent. with 1 lb., and will not stretch sensibly with a weight of 0.75 lbs. per pound per knot.

Thus a strand weighing 300 lbs. per knot, such as was used for the Anglo-American cables, will rarely carry 450 lbs., will stretch 1 per cent. with 300 lbs., and will not stretch sensibly with 250 lbs.

The weight per nautical mile (6087 ft.) of copper wire of diameter d expressed in thousandths of an inch is $\frac{d^2}{55}$; and if the conductor be a strand, the the weight is $\frac{d^2}{70.4}$.

Great care is necessary in making the joint between two portions of the conductor. A scarf joint is first made by soldering together two tapered and fitted ends. Fine copper wire is wrapped round this joint, which is somewhat inflexible, and solder run round the wire. A second wrapping of fine wire is then given, and left without solder. The solder must be applied with resin, and not with spirits of salt.

The joint is necessarily less extensible and more brittle than the rest of the conductor, but if from any cause the soldered joint is broken and stretched so as to open, the fine wire maintains perfect electrical connection, being simply pulled out like a helical spring. The following is a Table of the relative electrical resistance of some metals and alloys at 0° centigrade showing the advantage of employing copper.

(Equal length and diameter.)

Silver	1
Copper	1
Gold	1.28
Iron	5.94
Tin	8.09
Lead	12.02
Brass	4.5
German silver	12.82
Mercury	58.15

Insulator.—Even the best insulator, such as glass and gutta-percha, do conduct to some extent, but if we were to express these resistances so as to form a construction of the last table, we should find for gutta-percha

About 60,000,000,000,000,000,000, or 6 by 10^{19}
And for glass ... ... 6 by 10^{26}

India-rubber has a somewhat higher resistance than gutta-percha, and different preparations differ considerably in their resistances.

India-rubber has been applied in many ways to the conductor. Most commonly tapes of masticated or bottle rubber are wrapped round and round the conductor until the required thickness is obtained. These tubes used to be gummed together by solvents, but this plan was found to cause decay, and has been abandoned. Simple heat has also been applied unsuccessfully, the india-rubber so heated becomes tacky. Mr. Siemens applied the tubes longitudinally, and simply pressed the freshly cut edges together. This did not make a safe joint. Some manufacturers vulcanized the india-rubber, but the material thus formed, although quite homogeneous, absorbed water, was subject to decay, and allowed free sulphur to reach the copper wire. Mr. Hooper's method of applied india-rubber has been the most successful; he covers the conductor with tapes of pure india-rubber next the copper, following by a coating of oxide of zinc and india rubber, which he calls a separator. The separator is enclosed in a jacket of vulcanized india-rubber. In the process of baking the core to vulcanize the jacket, a little sulphur passes the separator and slightly vulcanises the pure rubber, which is welded into a perfectly homogeneous mass; the core during this process is heated to 250° Fahr. and baked for four hours; it does not become tacky, and is remarkably compact and durable. The joints between two lengths of the insulated core are made with the same materials, and are baked for two hours in a steam jacket. This is the only application of india-rubber which has been thoroughly successful for submarine cables.

Gutta percha is more easily applied, and its use has been attended with almost invariable success; it is pressed out while warm and plastic through a die round the conductor; several successive coatings or tubes are thus applied till the desired thickness is attained. The first coating is attached to the strand by what is termed Chatterton's compound, being a sort of mastic composed of 1 part by weight of Stockholm tar, 1 part of resin, and 3 parts of gutta percha. This compound is also used to fill the interstices in the strand and to attach the successive layers of gutta percha on to the other.

Gutta percha will bear about 3.500 lb. per square inch of section, but owing to its great extensibility it does not add more than about one-third of its strength to the copper strand. It will stretch 50 to 60 per cent. before breaking, and will bear an astonishing amount of ill-usage, such as knotting, squeezing, or stretching, but is easily pierced by a nail or similar sharp tool, or cut by a knife. It becomes soft at the temperature of about 100° Fahr., and after manufacture should never be subjected to a higher temperature than 90° Fahr. The joints are made by heating the two ends of the covered conductor after the copper has been joined, and applying by hand successive coatings of warmed and plastic gutta percha, the separate layers of which are also cemented by Chatterton's compound. Much skill and extreme cleanliness are required in making these joints, which were a frequent cause of failure in early cables. If the gutta percha be either overheated or under-heated, the junction effected is not permanent, the gutta-percha at the joints becomes hard and brittle and shrinks back from the gutta percha of the core, leaving a very visible gap which destroys the insulation. The process is now thoroughly understood, but each joint is made under inspection and subjected to strict electrical tests after completion. When dry and exposed to light, gutta percha very rapidly decays, becoming brittle and porous, but under water it appears to undergo no change whatever. The writer has had great experience and does not know of one instance in which gutta percha has decayed under water. The electric and mechanical properties of the cores of his cables first laid down twenty years ago are as good as ever. The experience with india-rubber is totally opposed to this. All forms except Mr. Hooper's rapidly change under water. Mr. Hooper's appears hardly so absolutely permanent as gutta percha, but the change observed does not appear to be material. Hooper's india-rubber will bear much greater exposure to heat than gutta percha, and is much more permanent in dry places. Both gutta percha and Hooper's india-rubber absorb some water, but not to such an extent as to be mischievous. Some forms of india-rubber are rendered unfit for use by this absorption, which in pure india-rubber is such that the material absorbs 25 per cent. of its own weight of fresh water.

The completed core has considerable strength. The Anglo-American cables have a core with 300 lb. of copper and 400 lb. of gutta percha, and this bears without injury ¼ ton quite unassisted by the outer covering; it will stretch ten per cent. under this weight, and may afterwards be knotted and squeezed without any electrical injury being done. Before the application of Chatterton's compound the copper wire used, after a strain had come on the core, to allow the gutta percha to slip back over it without itself returning to its original length. This forced the copper to buckle, and in some cases brought it through the gutta percha. This can no longer occur. The dimensions of the core are determined by the number of words per minute required to be transmitted, and by the total length of the cable. With gutta percha cores the ratio of copper to gutta percha in pounds weight per knot varies from equality to two-thirds. The smallest core practically used has 73 lb. of copper and 119 lb of gutta percha per knot; a more common size is 10 lb. copper and 150 lb. gutta percha. The largest size yet adopted is 400 lb. copper and 400 lb. gutta percha for the French Atlantic.

The number of words which a core will transmit is inversely proportional to the square of the length, and when a constant ratio is maintained between the weights of the insulator and conductor, it is simply proportional to the weight of the core per knot. Let n be the number of words per minute which a cable of the length L in nautical miles will transmit with a mirror instrument. Let w be the weight of copper per knot, then,

$$n = \frac{C}{L^2 w}$$

where C is a co-efficient varying for the different

Digitized by Google

ratio between the gutta percha and copper. The following Table gives the value of C for several ratios:

Copper	100	100	100	100	100	100	100	100	100
Gutta percha	80	90	100	110	120	130	140	150	160
Value of C	163,000	175,000	187,000	196,000	205,000	21,500	22,400	23,300	24,000

If the Morse instrument be used, divide the value of n thus obtained by 14.

If Willoughby Smith's improved gutta percha is used, multiply n in either case by 1.17. This latter value will be correct for Hooper's material also.

Thus a core of 100 lb. copper and 120 gutter percha will transmit 20½ words with the mirror and rather less than 1½ words per minute with a Morse instrument; If Hooper's material or Willoughby Smith's improved core are used, the speeds would be 24 words and 1.7 respectively.

The Morse is restricted to short lengths of cable, thus 250 miles of the above core would transmit by Morse, twenty-seven words per minute, or as much as a clerk can conveniently send by hand; the mirror can be read at much more than 30 words per minute; but Sir William Thompson's new recording instrument will receive as fast as the mirror, and leaves a permanent writing which can be read at leisure; with this instrument as much as 120 words per minute may be read if the core will allow it.

Outer Covering.—The core is served with hemp or jute applied wet, and either tanned or saturated with brine; originally the hemp had been tarred, but the tar tended to prevent the discovery of faults, sealing up any small apertuare temporarily. Sometimes for cables of moderate length several cores 3, 4, or even 7, were laid up together so as to form into strands of hemp, called worming, a circular rope, which was served like the single core into hemp or jute. These multiple cables of course transmitted indepedent messages through each core. The served core is commonly protected in cables intended for moderate depths by a sheathing of iron wires laid round in a long helix, so as to give the cable the appearance of an ordinary iron rope. The tube which the wires so laid on form cannot diminish in diameter, and hence stretches very little more under a given strain than an iron rod of the same weight per knot would do. The diminution of diameter is prevented by the abutment of each wire against its neighbor, so that the soft heart of the cable undergoes no compression. If the wires are laid on with equal tension, the strength of the completed cable is equal to the sum of the strength of the wires which compose it. In the spinning or closing machines, as they are called, the wire is wound on bobbins which as they revolve round the axis through which the core passes remain parallel, to themselves, so as not to put a twist in the wire.

A cable so formed is not spongy, and has little liability to kink, that is, to throw itself into a loop when leaving the hold of the ship in which it is coiled. The elongation of an ordinary iron covered cable with half the breaking weight varies from about 0.5 to 1 per cent., an amount which can never injure the core. While being laid the cable generally untwists slightly, but the elongation from this cause also is insignificant.

The iron wire is protected from rust by being galvanized, and still further by being covered with hemp or jute, and a compound of asphalte and silica.

A cable covered with good iron should bear 2 tons per pound of iron wire per fathom.

Thus a cable with 3,750 lb. of iron per knot should bear 7½ tons. This corresponds to an intensity of stress equal to about 41 tons per square inch. The larger gauges and inferior qualities of iron will not bear this. The following table shows practically the weights borne by wire supplied by Messrs. Johnson, of Manchester.

B. W. G.	Breaking strains.	Weights per knot. cwt.
00	2067	20.59
0	1716	16.47
1	1393	12.02
2	1212	11.49
3	1048	9.55
4	873	8.06
5	749	6.90
6	622	5.86
7	530	4.61
8	449	3.86
9	369	3.12
10	306	2.55
11	242	2.05
12	184	1.68
13	144	1.28
14	109	0.98
15	86	0.73
16	66	0.59
17	51	
18	39	

The smallest number of wires ever used is 9, and this makes too stiff a rope.

Eighteen is a very large number.

Twelve makes a good rope

A large size of wire is used for shore ends, to protect the cable against anchors, attrition and rust; for this purpose, cables of from 10 to 20 tons per knot are used. The largest size is generally covered with 10 or 12 strands, each spun of three galvanized iron wires. A cable so made is much more flexible and easily handled than one covered with solid wires.

Cables covered with ordinary iron are hardly strong enough to resist the strains to which they are exposed while being laid in depths above 1,500 fathoms; above this, homogeneous iron wires (really a variety of steel) are employed. This material will bear from 50 to 60 tons per square inch. The Malta and Alexandria cable is an example, which differs in nothing from the shallow water cable except in the substitution of homogeneous iron for ordinary iron.

The main cable between St. Pierre and the United States is a good example of this type.

Core copper, 7 wire strand, weighing per knot	107 lbs.
Gutta percha and compound	150
Jute yarn serving	
Outer covering 10 B. B., galvanized	
Iron wires 0.165 in. diameter, weighing per knot	4,254

Outer Protection.—For still greater depths, recourse is had to a more complex type of cable. Each steel wire is enclosed in a serving of hemp or manilla, the strength of which may be added to that of the steel in calculating the strength of the cable, while the serving adds nothing to the weight of the cable in water. The elasticity of a straight hempen fibre is less than that of most steel, but by choosing the lay of the hemp strands properly, the hemp or steel may be made to stretch so evenly as to give way together, and then the strength of the served wire or cable is found to be actually greater than the sum of the strengths of the compound parts; each part breaks at its weakest point, but these weak points never all occur at the same point in the compound cable, so that we obtain for the strength of the cable the sum of the average strengths of the parts, which is, of course, greater than the sum of the weakest parts.

The Atlantic and most other deep sea cables are of this type. The following are the weights of the materials used per knot in the French-Atlantic Cable:

	Diam.	Inches.	Breaking strain.
Copper, 400 lbs. per knot		0.168	644
G. P., 400 lbs. per knot		.463	
Serving, 234 lbs. per knot		.669	
Homogenerous wires (10)	1,589	.1	950
Manilla strands (50)	1,091		550
Each served wire	2,680	.245	1,550
Cable	3,701	1.134	16,530
Weight of cable in air	1.652 tons per knot.		
Weight of cable in water	0.753	"	
Strength in tons	7⅜ tons.		

The completed cable is coiled in the works, and on board ship in large circular tanks with eyes from 6 to 8 feet diameter. On board the Great Eastern the largest tank was 75 ft. diameter, and 16 ft. 6 in. deep, holding 1,100 knots of cable. The diameter of the tank depends on the beam of the ship. One twist per turn is necessarily put into the cable as it is coiled away. This twist as necessarily comes out when the cable runs up out of the tank. In fact, the one operation is exactly the reverse of the other, and leaves the cable as it came from the spinning machine. The cable as it runs up from the tank is led to the centre, and confined to the centre by large wrought-iron horizontal rings, which prevent the line from lashing out under the influences of centrifugal force.

From the tank it runs in troughs to the brake drum, round which it takes four or five turns. This drum is prevented from turning freely by a break strap, which thus puts the necessary retarding strain on the cable.

It is essential that the restraining friction should be constant, a result obtained by the Appold break. In this arrangement both ends of the break straps are attached to one lever in such a manner that when the break begins to turn it tends to lift the lever and weight hanging from it, and as the lever is lifted it slackens the break strap, until the difference of tension on the two ends of the strap is equal to the weight hanging on the lever. When this is the case, the lever is no longer lifted, but remains stationary with the strap, allowing the drum to turn, restrained by a constant friction equal to the weight on the lever (reduced to the point where the strap is attached). If the co-efficient of friction increases, the lever will be a little more lifted, and the strap slackened; if the co-efficient of friction diminishes, the lever and weight will fall, tightening the strap; but in any case the retarding force will be simply equal to the weight. After passing the break drum the cable dips under a weighted pulley, which rides suspended on a V of taut cable. If the strain increases, the rope tightens and raises the pulley; if the strain diminishes, the weight and pulley fall. Thus the height of the pulley indicates the strain. This instrument is called the dynamometer. Lastly, the cable passes over the pulley into the sea.

THE GOVERNMENT AND THE TELEGRAPH.

[From the Chicago Tribune.]

Washington advices agree that there will be another effort this winter, more vigorous than any previous one, to invest the Government with the telegraph business of this country; that the Postmaster-General will reiterate his recommendations of the project in his forthcoming report; and there is an impression that the President will favor it in his message. The public objections to this scheme are so numerous and grave that they cannot be repeated too often.

1. The purchase of the telegraph lines by the Government would establish a precedent for further centralization of power that would be without limit. The same specious arguments that suggest it would be brought forward in due time to warrant Government control of the railroads, the express business, the steamboats, the stages, and all other common carriers. This has been the case in Prussia and some other European countries where the first step has been taken. It would be impossible to fortell where the Government assumption of private business would end, short of national bankruptcy.

2. The Government cannot accomplish the results which are promised in this matter. It is simply impossible, with our complicated, heterogeneous, and corrupt Civil Service system, to transact, promptly and accurately, the telegraph business over the enormous area of our territory. The difficulties that the Government still encounters in the working of the slower machinery of the mails, is a sufficient warning that it would be utterly incompetent to manage the more delicate and exacting business of telegraphing.

3. The Government would not hold itself responsible for any damage to private interests resulting from the tardy or inaccurate administration of the telegraph. It rests with the Government to fix its own accountability in all cases, and the circumstance that it now refuses to be responsible for the loss or wrong delivery of letters, or even of postal money orders, is a clear indication that it would not assume any liability for damages in the more serious mistakes that could result from telegraph errors. Government monopoly of the telegraph would then present to the public this condition of affairs. A very large increase of the delays, errors, and damages, and an arbitrary withdrawal of every means of indemnification for loss. The commercial public will scarcely contemplate with rapture any such state of things as that.

4. The Government espionage that would thus be exercised over all private business, and all political messages that should be entrusted to the telegraph, would become a serious menace to personal freedom, and enable any Government official to become a successful speculator or blackmailer on the knowledge of other men's business. So long as the telegraph remains in the hands of private persons or corporations, responsible in law for the acts of their servants, no general or serious harm can follow the possession of this knowledge. Any use made of it by the operators or agents of private corporations, whether for the purpose of revealing it to the public or for private benefit, would be fatal to their own reputation and business. Their employees understand that good faith in this matter is a condition of their retention, while Government employees would equally understand that their places depended mainly upon political influence, of which this espionage would become a part.

5. The increase in the official patronage of the Government would, of course, be one of the greatest evils of the proposed system. Not less than 30,000 of new offices would be created. Probably this is the reason why Mr. Chorpenning Creswell is so anxious to put it through.

6. By controlling the telegraph the Government would virtually control the press of the country. It could mould news to suit its own purposes; it could punish obnoxious journals in a thousand ways where there would be no redress. In short, it could possess itself of the only medium of public opinion.

While these arguments against the Government purchase of the telegraph lines will suggest themselves as potent against the scheme, the advantages that are claimed for it will likewise be found to be impracticable and vissionary. It is not true that the cost of telegraphing would be *reduced;* it would simply be transferred to the tax-payers. To carry messages at the proposed rates it would be necessary to put up at once three times the number of telegraph wires that are now in use. They would cost money, and cost the government more money than individuals or private corporations. The expense of managing the increased number of lines would be proportionately increased, and this increased expense would fall largely upon people who never use the telegraph. It is needless to enlarge upon the injustice of such a proceeding. The Government can, in no way, be more enterprising than private capital. New telegraph companies are organizing, and new lines building all the time. Competition will bring the charges for telegraphing down to the lowest figure at which the service can be afforded. That is low enough; and when that point is reached, there will be no robbing of Peter to pay Paul,—no taxing of one portion of the community to furnish cheap telegraphing to another.

EARLY REMINISENCES OF THE TELEGRAPH ON THE PACIFIC COAST.

San Francisco, Oct. 25, 1872.

This day nineteen years ago, the first line of telegraph on the Pacific coast was completed between this city and Marysville, and opened for business. It was built by the California State Telegraph Co. Its length was 200 miles, connecting with five offices, San Francisco, San Jose, Stockton, Sacramento and Marysville. On the day of completion, Jas. Gamble, who was appointed Manager at Sacramento, sent the first dispatch over the line to San Francisco.

The tariff from this city to Marysville, Sacramento and Stockton, was $2.00 for ten words, and 75 cents for each additional 5 words or less. The present tariff between these places is 25 and 10, and even at this *enormously* low rate, would you believe it, some of our papers are harping on the "great monopoly" and outrageous rates paid for telegraphing in this State. When will they be satisfied?

This line of 200 miles cost $150.000. It could now be put up for $25.000. Even at its high cost and expensive management, the line paid handsome dividends to its stockholders. The salaries paid operators were $150 to $250 per month. The line was poorly built and badly insulated, the latter being iron hooks set in blocks boiled in shellac, as nothing better could be had at the time. In dry weather, this style of insulation did very well, the top of the poles would have answered the same purpose, but when the rains came, "the old string"—as the boys called it—became pretty well soaked, so that it was a tight squeeze getting a dispatch through. We worked through two "rainy seasons" with the shellac plugs, when they gave way to rubber caps with iron shields, a decided improvement when new, but they proved a "delusion and a snare" in the end. The Wade "nigger heads" were their successors, and they in turn gave way to rubber hooks and blocks, which latter did good service for a time, but are now being discarded for the new screw glass, showing that we are coming back to first principles. This old line has been "reconstructed" so much, that it would now compare favorably with the boys jacknife, which he had used for so many years, but which had had three new sets of blades and two new handles during the time. The line is still standing, just as it was built, except that it has had its insulation renewed five times, and I might incidentally mention, has also had new wire and poles.

From 200 miles, the telegraph on this coast has grown to over 8,000, and is still marching on, over a thousand miles of wire having been put up since last spring alone.

Among the Pioneers who worked the "old line," and who are still with us, are Jas. Gamble, now General Superintendent of the Western Union Pacific Division; Geo. Senf, Manager at Virginia City, Nevada; John Pattison, Manager at Nevada City, Cal., and John Leatch, Chief Operator at Sacramento. Gamble and Senf are the only two who have never been out of service during that time. Leatch made a change to the "States," but in a few years drifted back. Pattison turned politician, and sank so low as to be a member of the Legislature, but couldn't stand more than one term. W. B. Ransom was the first Superintendent, but left the State after three years of service.

The reason for adopting the "five additional word" rate, instead of *each* added word, as in older States, was because early California used no smaller coins than a "quarter" or "two bitts," as it was and is still called.

When an old miner passed his dispatch into the office, he usually threw down a "slug"—an octagonal gold piece, worth $50. Instead of this, he sometimes *weighed out* the requisite value in gold dust. This latter was a very prevalent style of currency in the very earliost days of our State. Five cent pieces pass current now, and we are fast drifting towards the pennies.

Pioneer.

MR. FIELD'S BANQUET.

Mr. Cyrus W. Field gave a banquet at Buckingham Palace Hotel, London, November 28th, in celebration of the American Thanksgiving Day, at which Mr. Gladstone and other distinguished gentlemen were present. During the dinner several telegrams were sent to America, and answers received thereto, among which the following were exchanged between President Orton and Mr. Field.

London, November 28, 1812;

To Hon. Wm. Orton, *President Western Union Telegraph Company, New York:*

We are surrounded by those who are connected with the Submarine Telegraph lines to the Continent of Europe, Egypt, India, China and Australia, and they join with me in sending kindest regards to you, and we trust that the cordial relations which now exist between the great submarine lines of the world and the Western Union Telegraph Company may never be less, but grow stronger as we increase the cables that are necessary to transmit telegraph messages to all parts of the world.

C. W. Field.

New York, November 28, 1872.

To Cyrus W. Field, Esq., *London:*

Accept for yourself and convey to your guests my thanks for your and their kind greetings. It will continue to give the Managers of the Western Union Company pleasure to contribute to the friendly relations which now exist between the companies, whose lines and cables are circling the globe with bands, whose strength is measured by the friendships they aid to promote, and whose duration depends only upon the peace of the world which they assist to perpetuate. May you live long to enjoy the credit so justly your due for the part you have borne in this great work.

William Orton.

FOREIGN TELEGRAPHIC ITEMS

THE traffic receipts of the Eastern Telegraph Company for the month of October amounted to £31,409, against £27,251 in the corresponding month of 1871—showing an increase of £4,158.

The special resolutions for effecting and completing the amalgamation of the British-Indian Submarine; Falmouth, Gibraltar and Malta; Anglo-Mediterranean; and Marseilles, Algiers and Malta Telegraph Companies, have been unanimously confirmed by the shareholders of the several companies.

Telegraph shares, which have been much neglected latterly on the Copenhagen Exchange, and followed a downward tendency, have now become an object of speculation, and are rising rapidly in value. The reason assigned for this improvement is that the Etatsrath Herr Tietjen, who has returned from a journey abroad, has succeeded in persuading the President of the French Republic to grant him the long wished for concession to lay down a submarine telegraph cable between a spot on the north coast of France—probably at Dunkirk—and Fanoe, on the coast of Jutland. Great things are expected in Denmark from this new line, as then the traffic with France and the south of Europe, as well as the transit communication with North America, and by-and-bye with Brazil, will be liberated from the present onerous and expensive necessity of making use of the German telegraph system. At the same time we learn from Copenhagen that the Siberian land lines, which have been broken, and the traffic interrupted by the late inundations, have been repaired and are again in full working order—which was not expected to be accomplished before the ensuing spring.

Major-General Von Chauvin, the Director-General of the German telegraph department, has tendered his resignation, and, at his own request, been placed at the disposal of the War Office at Berlin for active employment in the army.

The Northern Telegraph Company announce that the Siberian land lines, which had been interrupted for some months, having now been re-established their communication with China and Japan is again in perfect order, and that messages for those countries are accepted at all postal stations at a uniform rate.

The India Rubber, Gutta Bercha and Telegraph Works Company's steamer Dacia has left Silvertown with a submarine cable, to be laid direct from Spain (Bilbao) to the Land's End, Lizard Point, the company holding a concession to lay this cable from the Spanish Government.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ending the 2d of November, 1871, was 312,054—an increace on the corresponding week of last year of 73,786.

THE new telegraph line in Japan will be opened in state by the Emperor as soon as completed.

The directors of the China Submarine Telegraph Company have given notice that the receipts for the year ended June 30th enable them to declare a final dividend of 4s. per share, making, with those already paid, a distribution of 8 per cent. per annum.

The advices from Buenos Ayres state that, according to expectation, in about a couple of months the completion of some telegraph lines which are in progress of construction from Valparaiso along the West Coast toward Panama, will bring Buenos Ayres within five days of Europe. The Transandine telegraph from Valparaiso to Buenos Ayres was in steady operation. The distance is 1,138 miles, of which 1,058 are in Argentine, and 180 in Chillian territory, and the line includes two snow cables of 30 miles over the Andes.

The defect in the Pentland Firth telegraph cable has been discovered. It is reported to have occurred a short distance from Wales, and the steamer Carolina is at present in the neighborhood waiting the first opportunity of fine weather to effect the repair.

THE LATEST BRITISH "BLUE BOOK" is the "Annual Report of the Postmaster-General," which shows, among other items, that during the last year 12,700,000 telegrams were transmitted from stations in the United Kingdom.

THE acting President of Costa Rica has given orders that the actual service of the telegraph stations should be improved as much as possible.

PRESENTATION TO MR. JAMES D. REID.

Upon the retirement, last Spring, from the telegraphic business, with which he had been intimately associated for twenty-seven years, of Mr. James D. Reid, his telegraphic friends and associates, and more especially those connected with the Telegraphers' Mutual Life Assurance Association, the success of which has been to a great extent the result of his unselfish interest and labor, desired to present to him a token of the affection and esteem in which he was held. For this purpose voluntary contributions were invited, which invitation was most cordially responded to.

On Saturday, 23rd ult., the amount collected was delivered to Mr. Reid, at the office of the Atlantic Cable Companies, No. 88 Liberty street, where the presentation took place. The letter of presentation from the Committee, enclosing a check for the amount contributed, and indicating the use to be applied, was handed to Mr. Reid by Mr. W. O. Lewis, with a few brief but appropriate and appreciative remarks on behalf of those who had voluntarily and gladly united in the testimonial.

Mr. Reid was evidently very deeply affected at the expressions of kindly and affectionate regard which illumined the close of his long and useful telegraphic career. He responded briefly but feelingly, expressing the pleasure and satisfaction which he had experienced during his many years of telegraphic service, and his deep and heartfelt appreciation of this last manifestation of the esteem and regard of his friends and former associates. Subsequently he acknowledged the receipt of the testimonial in the letter to the Committee which is published herewith.

NEW YORK, *Nov.* 22.

DEAR MR. REID—We are requested to ask your acceptance of the enclosed check for five hundred and eighty-three dollars and forty-two cents, with the suggestion that you employ it in making such additions to your library as may be most acceptable to you. It has come to us entirely voluntarily, and mainly from telegraphers widely separated from each other, accompanied by many kind words respecting your long and faithful telegraph service, and the true Christian charity ever exercised by you in your official as well as in your personal relations, and by sincere and earnest expressions of hope that your life may be long and your happiness complete. Will you, therefore, please accept the offering, more as a substantial indication of the universal kindly regard for you than for its intrinsic value, and permit us to continue always

Your sincere friends,

W. O. LEWIS,
A. S. BROWN,
A. B. CHANDLER,
D. R. DOWNER,
F. L. POPE,
Committee.

To JAMES D. REID, Esq.

NEW YORK, Nov. 23, 1872.

To W. O. LEWIS, A. S. BROWN, A. B. CHANDLER, D. R. DOWNER, F. L. POPE, *Committee.*

DEAR FRIENDS—Although I have already made a verbal acknowledgment in your presence of the ample gift to me of which you were alike the partners and bearers, yet you will not blame me if I desire that my expression of gratitude therefor take such a shape that it may reach the distant ones you so well and indly represented.

As I leave pursuits to which my best years and such ability as was mine were all affectionately devoted, it is pleasant to be made to feel that the same friendliness which twenty-seven years ago welcomed and aided me in my work, now comes to bless and iradiate its close; and it would be very grateful to me could I now see, not you alone but every well-remembered face associated with our past toils, that I might grasp again the hands of those who have in in the years now gone made labor to me a pleasure, and fringed every care with delight. Few men, surely, as in memory I live the past over again, can have had a sunnier path along which to do life's work. My only regret is that it has become necessary to recommence it under new auspices and with new companions.

Since you left me I have read the letter under cover of which your gift came. The kindness of the language has touched my heart. The gift was not needed to emphasize its expression, yet will be gratefully used to commemorate it. It will be devoted as you suggest, and which is in the line of my own needs and tastes. Some day I hope to be able to show you how much it has added to the beauty of my home and to my own personal enjoyment. It will be a memorial which will inspire me to be truer and kinder to my fellow men. God bless you all.

Gratefully and affectionately yours,

JAMES D. REID.

NEW SUBMARINE TELEGRAPH CABLE.

Telegraph cable works have been erected on the Pacific coast, at San Francisco, and the Electrical Construction Company have completed the first section of their first job, to wit, a cable for the British Columbian Government. It is intended to be submerged under Rosario Straits, to connect Vancouver's Island, at Victoria, with the Continent.

The cable is 35,000 feet in length, and weighs about 30,000 pounds. The conductor is composed of seven No. 20 copper wires of 97 per cent. fineness. The dielectric consists of two coats of pure gutta percha 9-32 of an inch in diameter, with intermediate coatings of Chatterton's compound. The gutta percha coil is served with two coats of machine banding, well tarred, and covered with a protecting armor of No. 9 galvanized iron wires, laid on spirally. Electrically tested, the resistance of the conductor is eight ohms, or B A units, per knot, and the resistance of the dielectric or insulating medium, 443,000,000 ohms per knot. The company has an order on hand to manufacture another cable 30,000 feet long, for the Puget Sound Telegraph Company, to establish a connection between Seattle and Port Townsend.

DEATH OF EMILE PROVOST.

M. Emile Provost, a French scientist and an inventor of considerable note, the originator of several improvements in electric apparatus which have been favorably received, died last week by his own hand in this city. He had taken up his residence here, and had, it is said, at the time of his death, completed an electro-motor, which, not working satisfactorily, his disappointment at the result and the devil of drink, brought upon him the sad state of mind in which he terminated his career. The causes were, it is said, the more likely to unsettle his reason from the effects of an injury to the head received by M. Provost some time ago, and from which he never fully recovered.

IN a recent article, in which the writer differs from an opinion formerly expressed by him, he supports his right to change his opinion by quoting an old dictum of Faraday's, that "the only man who ought really to be looked upon as contemptible is the man whose ideas are not in a constant state of transition."

CORRESPONDENCE.

"BY THEIR WORKS SHALL YE KNOW THEM."

CHARLESTON, S. C., Oct. 29th, 1872.

To the Editor of The Journal of the Telegraph:

Mr. G. W. Bell, an old operator, and for a long time employed in the W. U. Telegraph Office in this city, leaves the service of that Company on the 1st of November, to engage in other business. By his genial disposition, and his many traits of kindness and gentlemanly character, he has won a host of friends. May he prosper, and may success crown all his undertakings. H.

INSURANCE MATTERS—CONTEMPLATED CHANGE IN POLICY.

To the Editor of The Journal of the Telegraph:

Much has been said and written upon the subject of appointing agents to act for the Insurance Association in the districts or sections in which they may be located. The officers and Executive Committee have given the matter full consideration, but have hitherto deemed it best not to make any such appointments.

It is thought, however, the time has now come when agents can be advantageously employed, and as fast as suitable men are found, and it is deemed best to appoint them, it will be done. They will, of course, serve without remuneration. Great care will be taken that only men of personal integrity who will take an individual interest in the well-being of the Association will be named.

The active interest shown shown by certain members at a number of points where we have a large membership is greatly appreciated by the Committee. They feel that our present prosperity is perhaps in a large measure due to these gentlemen who have voluntarily taken upon themselves much work, which otherwise would have been but poorly done, if not entirely neglected. D.

To the Editor of the Journal of the Telegraph:

It is of frequent occurrence that messages are sent, in which there is no interrogation, or answer asked for, and yet, replies are received, "collect," with "Tis ans." Parties receiving such messages often demur, and refuse payment. How are we to govern in this case?

Answer.—If the party to whom the answer is addressed refuses to pay for it, his correspondent will be responsible for the amount. We think the intances must be rare where such refusal would ensue.

To the Editor of the Journal of the Telegraph:

Why not transmit figures as written in telegrams offered for transmission rather than insist on having amounts always written out. It is a never ending source of annoyance to enforce rule requiring amounts to be expressed by letters. After a customer has spent ten or twenty minutes in preparing his telegram, he is likely to become sorely vexed when he finds, as is often the case, that he must rewrite his entire message to bring it within the requirements of a rule he can see no necessity for. Probably in most cases there would be no greater liability to error in transmitting figures than in writing them out. H.

Answer.—The rule requiring amounts or numbers to be written in words was made for the purpose of preventing mistakes. It may be true, as asserted by our correspondent, that there would be no greater liability to error in transmitting figures than in writing them out, but such is not the opinion of any experienced telegraphist with whom we have consulted upon this subject. A great many errors are made in transmitting amounts and numbers; and we suppose that the time will never come when accuracy will always be secured. Too much care cannot be observed; and the customer ought to be willing to assume a little extra work for the purpose of securing the correctness of his own despatch. Managers, when requiring customers to observe this rule, should explain the reason for its requirement, and should also advise their customers to insert the figures also, as an additional safeguard.

NASHVILLE, Tenn., Nov. 15, 1872.

To the Editor of the Journal of the Telegraph:

Keep a close lookout for a certain "Dead Beat and Jeremy Diddler" known as W. T. McGenty, alias Roberts.

He claims to be a railroad operator, and has good papers purporting to be from the superintendent of the Illinois Central Railroad, dated Centralia, Illinois, May, 1872.

He is unworthy of your confidence. The operators here, at Louisville, Ky., and Decator, Ala., know him something over a hundred dollars worth.

The last heard of him he was in Indiana.

He is about five feet eight inches high, weighs 130 or 40 pounds, ruddy complexion, Burnside whiskers, and when here, had his wife and two children with him, he so manages as to keep them in destitute circumstances for the purpose of exciting the sympathies of all charitable-disposed telegraphers. Let him severely alone. NASHVILLE.

RULE 54 READS AS FOLLOWS:

"All messages requiring an answer will have the word answer plainly written upon the envelope, and the Messenger instructed to make diligent efforts to obtain it; but should he fail to do so, the reason, in writing, must be returned to the Delivery Clerk, who will notify the office, from which the message is received. Messengers must in all cases be supplied with No. 2 blanks, on which answers can be written."

Complaint is made that this rule is not observed, and we have received several spirited communications upon the subject of which we publish the fol lowing well conceived epistles which we trust will have the effect of causing a thorough compliance with this excellent rule.

"I desire to call attention to the *fact* that Rule 54, one of the *most important* rules of the Company, is almost entirely disregarded. I know, of scarcely an office, large or small, that pays any attention to it except in cases of *non-delivery* which falls far short of compliance with the wise provisions of said Rule.

I have watched carefully the effects of this neglect upon our business, and can affirm positively, and am sure that every Manager will after careful observation agree with me in the following statement:

1st. This neglect neutralizes five-eighths of the benefits the company should receive from what no other Telegraph Company in the world possesses, *i. e.*, its systems of through or long circuits.

2d. This neglect multiplies office messages, and consequently occupies the wires uselessly and to the detention of other business.

3d. This neglect *increases clerical work.* Probably nine out of ten Delivery Clerks who have not given Rule 54 a fair trial will say this is not so, but I reply if they have not tried it *how do they know.*

4th. This neglect leaves the *answers* to straggle into hands of the opposition company, or to be brought to our office at the leisure or conveyance of the parties addressed or their employees.

5th. This neglect, together with the sloath of parties who delay or neglect to answer promptly, is, and has been a prolific source of driving our best customers to the opposition.

6th. This neglect plainly decreases business, both directly and indirectly.

7th. This neglect is most probably owing to the indifference on the part of small offices and at large offices to fact that it seems like a mammoth undertaking.

Whereas the reverse is true. The rule is simple and has been followed here, and can be at any office on W. U. Lines.

It is true there are obstacles to be overcome at first, but they are of a nature that any vigorous delivery clerk can brush away after a week's trial. I might state other points if it were necessary. I am satisfied, and would take the strongest kind of an affidavit, that *this neglect or omission* to comply with Rule 54 has and is now retarding the growth of the company's business thousands of dollars monthly."

E. H. B.

"In reference to rule 54 the Company is blamed every day because answers do not come back promptly. When upon inquiry it is found that the messages go through quickly, and are in most of cases delivered in a few minutes after they are filed here, and the offices, in answer to our inquiries 'Why no answer?' say the party is not at home, or will write, or cannot answer until to-morrow, or will not answer at all, I understand from rule 54, that is the duty of the receiving office to furnish such information without our having to ask for it. It would save the Company a great deal of censure, and be more satisfactory to our customers if offices would attend to the rule." J. A. H.

"Customers, and especially traveling agents, come in office every day. Complain about not getting answers from their messages, or reason from office where message was sent to when answer was requested in body of message. We have to tell them, according to our rules, that their message was received and delivered promptly, and if not they would notify us, and we would notify them. They come back again in two or three hours, and if no reply is there they want us to send office message asking for answer. Most of the time we have to do it. They then want to know how soon we will hear from it. We tell them in about one or two hours. We send office message asking them to comply with rule 54, quick, and it is every eight times out of ten that we do not get a reply. We have to send second request, and then in about three or four hours we get answer that party left town, or that there is nobody there to give answer. Now, if all offices in such cases would act in compliance with Rule 54, it would save time and trouble, and one-third of the office messages we have to send." A. E. H.

"I find no trouble in carrying out Rule 54 in my department. We are watching every message that requires an answer, and either get an answer or notify the sending office why. The system for this work in this office is attended to satisfactorily by a messenger boy 14 years old." J. T. H.

A. C.—Pittsburgh is correct. There are six words. Figures are to be counted for as many words as are used when written out to represent them.

J. S. L.—If you have over-remitted to the Company, you are entitled to have it refunded, and, by forwarding satisfactory evidence of the same, the amount will be remitted to you. The Company only desires to receive what it is justly entitled to from any source, and is as desirous of the correction of errors when they are in favor of the Manager as when they are in favor of the company.

Digitized by Google

W. T. L. of Effingham is informed that the concern alluded to in his letter, is a swindle, and thus far, has not succeeded in deluding any sensible person into joining it. So far as its power now to do harm is concerned, it might as well be out of existence. Like all conspiracies conceived in a spirit of malevolence, light and exposure becomes fatal.

MANAGER.—Mauch Chunk. See reply to W. T. L.

H.—Certainly; a party desiring to send a message to any place, and mailed thence to any other place, has a right to do so by paying the regular tolls to the point at which it is to be mailed, and the postage.

A BEGINNER has been misinformed. We shall shortly publish a full description of the manner in which the Atlantic cable is operated.

OPERATOR.—We think it would—most decidedly.

B. G.—We think there is no material difference between the West and the East, when all the other considerations are substantially the same.

A. A. F.—You might do so under such circumstances, provided the party was willing to pay full rate, as provided for in Executive Order, No. 141, published in THE JOURNAL OF THE TELEGRAPH in the issue of Sept. 16, 1872.

J. W. F.—THE JOURNAL is sent to every office for the information and instruction of those employed by the Western Union Company. Managers are required to observe all orders and rules published therein, and to transfer to their tariff books the record of new offices, changes of tariff, etc. The paper is then to be carefully filed away for reference.

W. W. S.—It does not occur to us that there would be any particular gain in entering general information in red ink and new offices in black, but we see no objection to any one doing so if he prefer.

OPERATOR.—We are decidedly of the opinion that good temper and pleasant words are much more desirable than ill temper and angry words; and that, as a general thing, it is easier to conduct business according to the former than to the latter plan. It is, however, to be borne in mind that human nature is human nature, and embraces a great variety of temperaments, to some of which it is as impossible to be always pleasant as it is for us always to enjoy sunshine. You must, therefore, not be discouraged if your train dispatchers and other associates are sometimes cross and indulge in an unnecessary "blow." Do your own duty manfully, cheerfully and pleasantly, and resolve that when you arrive to the dignity of train dispatcher you will always have a kindly word and a "good morning" for all of your subordinates when you commence your day's work, and that, when the day is spent, you may not remember to have spoken a word which you could wish unsaid.

L. W. C.—Very much obliged for your favor. Hope you will induce your friends to do likewise. We are trying to make a success of the paper, and duly appreciate all efforts, from whatever source, to extend its circulation.

We think that by soaking porous cups and carbons every night they may be kept in good working order for many years.

E. S.—As a rule, we should not think that the proprietors of a Summer hotel who had the privilege of sending free messages on account of the location of offices in their hotel, would be entitled to such privilege after the closing of the office. All such arrangements, however, are properly the subjects of negotiation with the Company, and your Superintendent would be the proper party to apply to for directions upon this point.

GENUINE is referred to accompanying explanation under head of "Red Messages" for an answer to his communication.

G. R. S.—"St. James Hotel" should be counted as two words. According to Rule 9, names of persons and places, when given to things, must be counted according to the number of distinct words in each, and, surnames, containing any prefix, are to be counted as one word. St. James, being a surname, is one word, and Hotel being one word, and both being applied to designate a thing, must be counted according to the number of distinct words in each, viz: two.

C. G. S. It was entirely wrong to send the messages alluded to, free. Neither the railroad agent nor his correspondent have any right to send business messages of that character free over the wires of this company. You should report the matter at once to the Superintendent of your District.

Winchester, Va., is informed that "According to" are two words, according to Webster, as well as according to common sense.

C. A. O.—It is not true that this company has applied for an injunction to stop all opposition lines on account of their infringement of the Page patent.

Red messages must not be delivered until the next day, except as specially provided for in Executive Order No. 141.

CHARLEY.—See Executive Order No. 141.

C. P. M.—"Hard up" are two words. "Payday" is one word.

OLD 76.—Both should be entered in the tariff books. Send business by the cheapest route.

W. T. L. It appears from your statement that Mr. H. acted discourteously and unwarrantably in refusing to deliver your message. According to the rules of the Company, the receiving operator has no discretion in the premises, but must receive, forward and deliver any message from any other office unless it should endanger life or property, in which case the receiving office will hold such message until advised by the District Superintendent. If any message is improperly sent or counted, the manager of the receiving office must immediately notify the District Superintendent.

You should forward a statement of your case to your Superintendent, who will, undoubtedly, reprimand the party at fault.

A MANAGER requests us to render a verdict in the following case: To-day I received a message for Mr. Taylor; no other address given. There are no less than twelve Taylors here, each of different family. Does the Company require the message to be taken to each Taylor until he gets the person who the message is intended for, or am I to hold message until I get full address? By reply to this simple question, you will greatly favor.

Answer.—It would be well, under such circumstances, to send the message to such members of this numerous family as are accessible; failing to hit upon the right one, it would be proper to ask for better address.

RED MESSAGES.

Executive order No. 141, dated September 16, 1872, provides that "messages to be transmitted at half rate will hereafter be received at any hour during the day until offices close for the night. Offices opened all night will receive such messages until midnight.

"The tolls on half-rate messages will in no case be less than twenty-five cents.

"If a half-rate message has been received at the place of destination, and the party to whom the same is addressed calls at the office for it, the message may be delivered to him on his paying the difference between half rates and full rates on such message. No change will be made in the time of delivery of half-rate messages unless specially provided for."

PROCEEDINGS AT THE SIXTH ANNUAL MEETING OF THE TELEGRAPHER'S MUTUAL LIFE INSURANCE ASSOCIATION.

The sixth annual meeting of the Telegraphers' Mutual Life Insurance Association was held at the Western Union Telegraph building, No. 145 Broadway, on the afternoon of November 1st., Mr. W. O. Lewis in the chair. The minutes of the last annual meeting, also those of the special meeting held March 21, 1872, were read and approved. The reports of the Treasurer and Secretary were read and accepted. (These reports appeared in our issue of November 15.—ED.)

The suggestion contained in the report of the Secretary with reference to the appointment of local agents by the Executive Committee, was ordered to be carried into effect.

The Secretary presented the case of L. S. Daniels, of Hempstead, Texas, who had remitted thirteen dollars by registered letter for new applications and the payment of assessments in advance. Proof was furnished that the money was stolen from the mails. Mr. Daniels claimed that credit should be allowed by the Association. The Executive Committee declined, and Mr. Daniels, acting upon the suggestion of the committee, appealed to the annual meeting. After the matter had been fully discussed, and the letter from Mr. Daniels having been read, the action of the committee in regard to the matter was approved.

The suggestion in the Treasurer's report that the Executive Committee have discretionary power to use the reserve or expense fund on hand in payment of an assessment was adopted.

A Resolution was passed directing the Secretary to express the thanks of the association to Mr. Orton and the Western Union Telegraph Company for their generous action in paying the sum of $100 through the association to the heirs of such members who at the time of their decease were in the Company's service.

Mr. O. W. Lewis was then nominated for Treasurer for the ensuing year; declined. Mr. A. S. Brown was then unanimously re-elected Treasurer.

Mr. W. K. Applebaugh was nominated for Secretary; declined. Whereupon Mr. D. R. Downer was elected.

On motion, the sum of $150 was authorized to be paid by the treasurer for assistance during the coming year.

A vote of thanks was extended to Mr. Applebaugh, the retiring Secretary—also, to Captain Wm. Mackintosh, for providing accommodations for the meeting. Adjourned *sine die*.

NEW YORK, DECEMBER 2, 1872.

GOVERNMENT TELEGRAPH SCHEMES.

The near approach of the assembling of Congress is heralded as usual by the promoters of the various schemes for governmental interference in the business of telegraphy, in the shape of newspaper articles and correspondence, the purport of which is to show the great public advantages to be gained by such intervention.

In one of the leading newspapers of this city a letter was published not long since dated from London which contained a vast array of erroneous statements concerning both the Western Union Company and the telegraph business generally, the sole object of which seemed to be to mislead the public upon this question.

We recognize in this correspondent the author of a series of rhetorical and statistical romances purporting to be based upon the results of his investigations of the operations of governmental telegraphs in Europe, which have been used in this country during the last four years by the promoters of the Washburne scheme and of the stupendous Hubbard job. The repeated exposure of the gross errors of this writer and the proof of his inability to discover the truth, or even to comprehend the effect of his demonstrations, when, as is sometimes the fact, they destroy his own case, appear to have excited in him a decided prejudice against this Company. Whenever the question of Postal Telegraphs, says the writer, has been brought before the United States Congress, attempts have been made to place in doubt the veracity of statements regarding European telegraphy, and especially those statements which had reference to tariff rates have been called seriously into question. Now, concerning these two declarations, it gives us pleasure to say that they are both strictly true; not only have attempts been made to place in doubt the veracity of his statements, but it is equally true that these attempts have been attended with uniform success. The justification for calling seriously into question his statements which had reference to tariff rates will be apparent by an examination of the following list of rates from Washington to thirty-two stations in as many different States, which this *veracious* advocate of governmental telegraphy says are the rates charged by the Western Union Company. The first column contains the rates given by this correspondent which are called seriously into question by the figures of the second column, which contains the rates actually charged.

	Pretended rate.	Actual rate.
Ellsworth, Me	$2.10	$1.60
Keene, N. H	1.75	1.10
Montpelier, Vt	2.00	1.30
Waltham, Mass	1.75	1.20
Bristol, R. I	1.30	1.10
Fairfield, Conn	1.15	90
Genesee, N. Y	1.50	90
Harrisburg, Pa	70	40
Plainfield, N. J	1.15	75
Mt. Vernon, O	1.75	1.10
Annapolis, Md	45	25
Lansing, Mich	2.20	1.50
Lafayette, Ind	2.00	1.25
Peoria, Ill	2.80	1.50
Fon du Lac, Wis	2.80	1.50
Minneapolis, Minn	3.65	1.50
Des Moines, Iowa	3.20	2.30
St. Joseph, Mo	3.70	2.40
Little Rock, Ark	3.75	3.00
New Orleans, La	3.25	2.50
Jackson, Miss	3.25	2.50
Montgomery, Ala	2.75	2.40
Atlanta, Ga	2.00	1.75
Columbia, Tenn	2.25	2.25
Charleston, S. C	2.00	1.00
Raleigh, N. C	1.25	1.00
Tallahassee, Fla	2.75	2.40
Lebanon, Ky	2.25	1.65
Richmond, Va	75	25
Austin, Tex	5.50	4.25
Lawrence, Ks	3.60	2.55
Omaha, Neb	3.75	2.55

Thus it appears that, with but a single exception, the actual rates are less by an average of *thirty per cent.* than those given by this romancer, who waxes indignant because his veracity has been "called seriously into question." Certainly it will be beyond question hereafter.

But this exhibit is more false in the inference which it seems to justify than in the direct statements. Presumptively Washington has something to do with these thirty-two stations; yet, taking the month of May last, we find that *only six per cent.* of the business of Washington was with them. *Seventy per cent.* of the business of that month at Washington was with eight offices, not named by this advocate of government telegraphy.

The following table gives the names of these offices with the distances and rates from Washington, compared with rates from Paris to other European stations about equally distant.

	Distance from Washington.	Distance from Paris.	Rate from Wash'n.	Rate from Paris. (Gold.)
Baltimore	40		25	
Fontainbleau		36		20
Boston	460		55	
Frankfort		452		60
Cincinnati	610		1.00	
Bremen		558		80
Chicago	845		1.00	
Vienna		897		1.20
Louisville	718		1.25	
Venice		739		80
New York	226		40	
Brussels		215		60
Philadelphia	138		35	
Tours		145		20
St. Louis	952		1.50	
Olmertz		934		1.20

Thus it will be seen that the rates for the same distances in Europe are about the same as in this country. But suppose that it could be shown that the rates were cheaper in Europe. This by no means would prove that governmental telegraphy was desirable. The official reports of the operations of the telegraphs in Europe for 1870, the last year for which full returns have been published show that the expenses for the year were $19,675,487, towards which the receipts furnished $14,455,352, leaving a deficit of $5,220,135, to be provided for by the proceeds of taxation. These figures offer a very fair illustration of the economical argument against government telegraphy. Such an expensive luxury the Governments of Europe may from State policy, indulge in, and their ambition, fears, or mistaken views of the public need may prompt them to squander the money of their people in carrying on the business of telegraphing, but in this country, a deficit of several millions a year would never be tolerated for any such purpose.

Of the total expense attending the operation of the telegraphs in the United States, over 65 per cent. is paid for labor alone. Any increase of the business must necessarily call for an increase of labor, and the Government, if it take the lines and works them at a low rate, must either do so at a loss or compel the operators to serve at greatly reduced salaries. Government telegraphy in this country, if intended to be self-supporting, must be performed at rates as high as those now charged. If a low rate should be inaugurated, there would be a large deficit to be made up by taxation. In this case those who do not wish to send telegrams would be taxed for the benefit of those who did. That the telegraph is not of such general use as to render it a necessity for all, is shown in the fact that only one telegram is sent per annum for every three inhabitants, and yet the number of telegrams per head annually sent in this country is greater than in any other country in the world. It is said by some of the advocates of Postal Telegraphy that messages are sent throughout Great Britain at a uniform rate of twenty-five cents, and that a profit is made upon the business; and the question is asked why the same rate cannot be made for this country. If the statement were true, which it is not, it would only be necessary to do two things in order to secure this result, viz.: first, hire operators at from five to eight dollars per week, the wages paid to the best class in England, and, second, to compress the territory of the United States within the area of the British Islands; or, in other words, to remove the population of the United States to within the territory of the New England States.

If the genius of our institutions and the fundamental principles of our polity did not forbid Government supervision of telegraphs, there are two circumstances which, in this country, must always make our telegraphic system too unwieldly to be managed by a centralized bureau of Federal officers: One is the vast area of territory over which the network of wires extends, and the others the prodigious activity of our people and the vast increase of business to which the system of telegraphic communication must adapt itself. How these exigencies would be met it is easy to foresee, and also what a strorm of obloquy would be evoked by the delinquencies of Government appointees, who held their places by political favor. Our telegraphs, like our banks and our railroads, must of necessity be left to private enterprise. The men who invest in these great enterprises their capital and skill are alone competent to manage them with economy and success. The experiment, wherever it has been tried, with even the small success achieved in Europe, of placing the telegraphs of the whole country in the hands of officials of the Government, requires a set of civil service regulations of a very different kind from those which ever have been or are likely to be established in the United States. If attempted here, the project could only add to the sixty thousand officials now appointed by the Government, and would thus open up new temptations and facilities for political corruption; while, on the other hand, the service would be so unsatisfactorily performed that the costly scheme would very soon be overwhelmed by popular opposition, and its destruction enforced by the universal voice of a resistless public demand.

THE proceedings of the Sixth Annual Meeting of the Telegraphers' Mutual Life Insurance Association will be found in another column of this paper. At this meeting but little business was transacted, owing, doubtless, to the very limited space of time judged by those present to be necessary for the performance of business affecting the closest interests of nearly two thousand members, who are scattered broadcast over the face of the country. Some thirty minutes were consumed in listening to the reading of the reports of the Treasurer and the Secretary and the discussion of a few unimportant matters. Then followed the election of officers for the ensuing year and an adjournment *sine die*.

There appeared in a recent issue of the JOURNAL a communication, complaining of the lack of interest generally manifested by members outside of New York and the immediately adjacent localities, suggesting as a remedy the removal of the headquarters. In commenting upon this communication, somewhat superficially, it must be confessed, we strongly endorsed this suggestion. Reflection, however, has brought us to a different opinion, and we are now strongly convinced that the suggested change would not prove an adequate remedy, and that the lack of interest is as great at this point as at others. There has got to be a radical change in the administration of affairs, in order to enlist the sympathies and interests of those whose sympathy and co-operation it is desirable to obtain. That the meeting partly recognized this fact is evident from the resolution adopted authorizing the appointing of agents in different sections. But this resolution did not go far enough. In the present condition of affairs the members of the Association located in the city of New York virtually control its action and policy; and while this remains the case no progress need be looked for elsewhere. It may be all well enough to say that this is an accidental state of affairs; that the question of locality does not, and should not, enter into the composition of an annual meeting; yet geographical considerations serve to render this view imperative. Prejudice is blind, and had much better be conciliated than opposed.

There are probably various ways of producing the required harmony and co-operation, but the plan we here suggest appears to us to be simple, yet comprehensive. Let the whole country be districted, each district to elect its representative, who shall also act as agent, to receive and forward notices and the amounts assessed. Such agents could be appointed for the first year, or until an election could be had. It would be well in these districts to conform, as nearly as possible, to State lines; but where a large membership was contained in a State it might be subdistricted. If each district, through its representative, had a vote at the Annual Meeting, sectional jealousy would be disarmed, and the Association would become what it is supposed to be, but which, in the opinion of many, it is not—national. The manner of voting and interchange of views could readily be carried on through the mail; stated questions could be voted upon yearly, and in this manner a lively interest and progress could be maintained. The views of any district could be conveyed to others by communication to the JOURNAL, which will gladly lend its aid in any matter conducive to the interests and welfare of the brotherhood.

There is another matter in which greater circumspection is necessary, and that is with regard to the state of health of applicants for a policy. The present system is too loose; and recent events have shown that the confidence of the Association in the endorsers of applications has bean abused. Instances have been known, and one notably of late date, where a policy was issued to a person in the last stages of consumption, upon the endorsement of a manager of an office, that the applicant was in a fair state of health. Such an endorsement probably arose from a generous feeling, but was in the last degree unjust, inasmuch as the applicant had evaded, until the approach of death became unmistakable, the responsibilities and pecuniary aid to others, which would have been assumed by an earlier membership.

We throw out these suggestions in the hope that the seed will not drop upon stony soil. We will not press their adoption until convinced that nothing better is practicable. It is certain, however, that the appointment of agencies throughout the country, simply for the purpose of facilitating collections, is not real progress, and it will fail to secure the desired ends. Not until the whole membership, in some practicable manner, has a voice and a vote, will the Association embody the entire fraternity.

GOOD WORK.

WE had not intended to make especial notice of any operating service, where all had done so well on the occasion of the great fire in Boston, but the feats of two operators employed by the Western Union Company, at New York, so nearly approach the marvelous, that they should be placed upon record.

With the duplex system on Monday, November, 11, Mr. F. H. Seibert received from Boston, in six and a half hours 330 messages, 157 of them without a break. They were sent by Mr. William McFarland. At the same time nearly as many more were going in the other direction upon the same wire. Upon another occasion Mr. Seibert received 221 messages without breaking.

On Wednesday November, 13, between the hours of 8.45 A. M., and 5:30 P. M., Mr. T. M. Miler sent to Boston with the Phelps printing instrument 700 numbered messages, and between 50 and 100 office messages.

This service stands unrivaled.

THE UNITED STATES TELEGRAPH MANUFACTURING AND SUPPLY CO.

In our advertising columns will be found the advertisement of the United States Telegraph Manufacturing and Supply Co., of Philadelphia.

They have the best facilities for the manufacture of telegraph apparatus of every description.

Mr. Wm. D. Sargent, who is the business manager of the Company, is a telegrapher of many years experience, and an electrician of great ability.

THE extent to which the telegraph has superseded the mails is well illustrated by recalling the history of the Boston fire. On Monday morning the *Gazette* printed eleven columns of matter relating to the great disaster, although the fire was raging even while our readers were perusing the accounts of what it had done the day and night before. Since then we have daily printed, as have done all the other leading papers of the country, in addition to the reports furnished by the Associated Press, from one to two columns of special despatches. Everything of interest, from little incidents to personal experiences and discussions of the value of Mansard roofs and the widening of Boston Streets, has been sent us from either Boston or New York. Of what use now would be letters? Who would read new accounts of the origin of the fire, the sweep of the flames, the destruction of business houses, the excitement in the city, all now being old news and as stale as news of the Chicago fire? Yet, what else than a skillful re-dressing of the old news could a correspondent, writing from Boston, do for his paper? The Chicago fire would have been just as fully reported but for the fact that the wires were down and the facilities of the telegraph office were much curtailed. This fact rendered such telegraph service as the country has had the advantage of this week quite out of the question.—*Cincinnati Gazette, Nov.* 16, 1872.

The *Journal* can bear testimony to the extraordinary full details of the fire furnished to the entire country by the Associated Press. These details were the work of the telegraph operators at Boston, who, as we learn from Mr. Orton, the President of the Western Union Company, performed more than four times the labor that was ever before executed within a corresponding period of time. In token of the services performed by them Mr. Orton has instructed the Division Superintendent to issue a general order thanking the Boston operators.—*Boston Journal.*

MR. GEO. T. WILLIAMS, of Cincinnati, brings to the notice of Railway Companies and others in need of manifold paper, agate pens, and other material, now regarded essential for the successful performance of the duties of train dispatching, the fact that he is engaged in that line of business, and is prepared to fill all orders with promptness. Mr. Williams can be relied upon. See his advertisement.

THERE was recently a collision on the Erie Railway, by which the engineman and fireman on one of the locomotives were instantly killed. Their widows brought suit for damages, and the plea of negligence is given as follows:

"It was claimed that the accident which caused the death of Chapman and Chasselette occurred through the negligence of the train dispatcher at Buffalo, in telegraphing two trains to pass each other. The telegrapher, it was claimed, was intoxicated at the time, and that the defendant had sufficient notice that his habits were bad. The further question was presented and argued at length as to whether the system of running trains by telegraph, for convenience of business as was shown in this case, is not, in itself, negligence."

The verdict in the first case was, for the plaintiff, $5,753.47, and in the second case for the plaintiff, $5,756.49, the trial being before the Circuit Court in Buffalo.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, Nov. 26, 1872.

On and after December 9th *Lincoln, Neb.*, will be added to the list of money order offices in R. C. Clowry's district.

G. H. MUMFORD, *Vice-Pres't.*

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
December 1, 1872.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular.

GENERAL INFORMATION.

Tensas, Ala., closed.
Business for Saybrook Point, Conn., should be sent and checked as directed in tariff book. It is another line office.
French Village, Ill., re-opened.
Cornland, Ill., re-opened.
Rossville, Kansas, closed,
Hereafter business for Carondelet, and So. St. Louis, Mo., will be checked to St. Louis, Mo., at St. Louis rate.
Business for Lincoln, Neb., now a W. Union office, should be sent via. Atchison, Kansas, and not to Plattsmouth, Neb,, as formerly.
Wells, Nev., is now a W. Union office, erase other line tariff.
Bay-de-Verte, N. B., closed.
Westport, N. Y., closed.
Messages for Tappantown, N. Y., may be taken and sent to Sparkill, N. Y., from which office they will be delivered. Charges for delivery one dollar.
Emerald, O., closed.
Hereafter the tariff to Avenue Drove Yards, Pa., will be same as tariff to Philadelphia, Pa.
The office at Tionesta, Pa., will hereafter be checked as another line office, "tariff for other lines" 25, 2, 140 Oil City, Pa.
Yatesville, Pa., closed.
Bangor, Pa., is now a W. U. office. Square 52.
Bristol Ferry, R. I., P. O. A. is Portsmouth, R. I.
Tiverton, R. I., re-poened. Check Fall River, Mass,

NEW OFFICES.

324 Carpenters' Station, Ala.

256 Plainville, Ga.
298 Bloom, Ill.
337 Edinburgh. Ill.
327 Mahomet, Ill.
299 Ellsworth, Ind.
289 Otterbien, Ind.
367 Eldridge, Iowa.
376 Hopkinton, Iowa.
376 Strawberry Point, Iowa.
367 Wyoming, Iowa.
230 Clyde, Mich.
230 Portsmouth, Mich.
57 Earlville, N. Y.
Greenpoint, L. I., N, Y. tariff same as Brooklyn, L. I., check Brooklyn,
92 Ira, N. Y.
36 North Hoosick, N, Y.
65 Union, N. Y.
222 Catawba, O.
181 Caywood, O.
181 South Olive, O.
66 Hauto, Pa., check Nesquehoning, Pa.
140 Karns City, Pa.
59 Landenburg, Pa.
94 Mt. Union, Pa.
112 Roaring Springs, Pa.
510 McKinney, Texas.
484 Riverside Texas.
480 Troupe, Texas.

OFFICES HAVING "SPECIAL SHEET A."

Will hereafter check Bay View Mass., same as "Special rate" to Gloucester, Mass.

HALF RATE messages may be taken for, and received from all offices in squares 509, 510 and 511.

ATLANTIC CABLE BUSINESS.

We are informed that messages for China and Japan, *unless specially addressed "Via Russia,"* will be forwarded from London by the Falmouth or Teheran routes. If parties therefore desire to avail themselves of the lower tariff "Via Russia," the indication of route must be charged between America and London or France and sent forward with the message. The above is an exception to the general rule by which "meseages are forwarded by the cheapest route unless specially directed by another."

Some explanation seems to be necessary in relation to the rate and route of business to and from offices of the Montreal Telegraph Company in New York State. The offices referred to have the abbreviation "Mont. Co." printed in the "Remarks" column opposite their names. Business for these offices may be sent *via.* different routes, as explained in tariff book, first paragraph, page 6 of instructions. The route and rate given in the tariff book, opposite the name of the office, although that through which most of the business properly flows, may, in other cases, be the most indirect and expensive. If this appears to be the case, then one of the other routes should be taken.

For example: The tariff book gives "Potsdam, N. Y., 25 and 1, Montreal Junc., Mont. Co." A message for Potsdam originating at any point West of Oswego should not be sent *via.* Montreal Junc., although rate *via.* Montreal Junc. is given in the tariff book. The paragraph referred to in the instructions says that business for this office, (as well as any other on the Montreal Company's lines in N. Y. State,) may be sent *via.* Oswego, Whitehall, or Montreal Junc.

The tariff book also directs that the *most direct* route given shall be taken. In this case Oswego and *not Montreal Junc.* is the most direct route.

WM. ORTON, *President.*

BORN.

FALLS—At Philadelphia, Pa., October 13, 1872, to Z. P. Falls, a son, weighing fourteen pounds.

LAKIN—At Winchester, Ill., October 29, 1872, to W. T. Lakin, Operator, St. L. V. T. H. and I. R. R., a son.

MAYES.—At Bloomington, Ind., Nov. 11, 1872, a daughter to T. A. Mayes, Manager W. U. Telegraph office.

MOORE—At Philadelphia, Pa., September 23, 1872, to Charles Moore, a daughter.

MCDONALD—At Antigonish, N. S., to Hugh McDonald, Telegraph Repairer, twins, boy and girl, weighing at their birth, fourteen and sixteen pounds. respectively

MARRIED.

CAHOON—HINCKLEY.—In the Episcopal Church at Wood's Hole, Mass., Nov. 13, 1872, by Rev. Hiram Carleton, Alden F. Cahoon, of Plymouth, to Rebecca L. Hinckley, operator W. U. Telegraph office, Wood's Hole.

CLEWELL-RHOADS—At Bethlehem, Pa., October 17, 1872, in the Moravian Church, by Right Rev. Bishop Edmund De Schweinitz, Oliver A. Clewell, Chief Operator, L. V. R. R., and Manager W. U. Tel. Office, South Bethlehem, to Miss Hattie A. Rhoads, of SouthBethlehem.

EARLE—HADLEY.—At Port Mulgrave, N. S., Nov. 5, 12, 78W. E. Earle, of the N. Y., N. F. & L. Telegraph Co., at Port Hastings, C. B., to Miss E. P. Hadley.

HAGENBUSH—HEIST.—At Allentown, Pa., Nov. 2, 1872, by Rev. Mr. Fliehr, Thomas H. Hagenbush, operator W. U. Telegraph Co., Scranton, Pa., to Miss Ida S. Heist, of Allentown.

LAWRENCE—TALLMAN.—At the residence of the bride's parents, First Place, Brooklyn, L, I., Nov. 13, 1872, by Rev. Henry Ward Beecher, Fred. H. Lawrence, Supt. of Telegraph, L. I. and G. R. R., of Lawrence, Kan., to Miss Mary L., daughter if Geo. C. Tallman, Esq.

MARTIN—PRICE.—At St. Mary's Church, Colmar, Ill., Oct., 1872, by Rev. E. T. Corfield, Ira O. Martin, agent and operator, C. and A. R. R., Godfrey, Ill., to Miss Mattie A. Price, of Colmar.

RHOADS—GILMAN.—At Bement, Ill., Oct. 29, 1872, by Rev. Mr. Fortune, E. Rhoads, operator T. W. and W. R. R., Litchfield, Ill., to Miss Laura E. Gilman, of Bement.

SPELLMAN—TENNERY.—At De Graff, O., Oct. 29, 1872, by Rev. A. G. Telford, T. L. Spellman, operator and assistant agent at Forest, O., to Miss Sate Tennery, of De Graff.

STANTON—HILL.—At Leverett, Mass., Nov. 13, 1872, by Rev. Geo. Colesworthy, Lowell M. Stanton, station agent, N. H. and N. R. R., and manager W. U. Telegraph office, Granby, Conn., to Miss Mary A. Hill, of Leverett.

TRITES—HADLEY.—At Port Mulgrave, N. S., Nov. 5, 1872, W. P. Trites, manager W. U. Telegraph Co., Monroe, La., to Miss Ray Hadley.

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

DEATH OF C. H. BAKER, E. A. HANVEY, AND T. J. ELLIOT.

Assessments Nos. 34, 35 *and* 36, *Issued Nov.* 25, 1872.

But once before in the experience of our Association have we been compelled to announce the death of three members at a single call. The Western Union Telegraph Company, with a liberality it has shown to us in various ways, then assumed one of the assessments. With our five years' experience we can now bear the burden alone. Let remittances be prompt and cheerful, and, as far as possible, in compliance with the subjoined notice to members.

Assessment No. 34.—Certificate No. 1,218, dated September 5th, 1871. Charles H. Baker, bookkeeper, P. & A. Line, Baltimore. Died October 26, 1872, from paralysis of the brain.

Assessment No. 35.—Certificate No. 1,547, dated April 12, 1872. E. A. Hanvey, formerly operator in the Western Union Office, Rochester, N. Y. Died November 4, 1872, from typhoid fever.

Assessment No. 36.—Certificate No. 940, dated September 6, 1870. T. J. Elliot, telegraphic engineer and instrument maker, Philadelphia. Died November 13th, from congestion of the brain.

These deaths call upon all holders of certificates, up to and including 1,676, for a remittance of *three dollars.*

A. S. Brown, *Treasurer.*

Notice to Members.—The following gentlemen have kindly consented to act, and have been duly authorized as agents of the Association, in the sections in which they reside. Additional agents will be named soon :

J. Merrihew, Philadelphia.
D. C. Hinsdale, Indianapolis.
J. J. Fowler, Memphis.
F. A. Armstrong, Cincinnati.
W. C. Long, Chicago.
J. M. Crowley, Augusta.
Wm. Sanford, Mobile.
D. L. Pike, Syracuse.
M. Marean, Washington.
A. Hunter, Toronto.
J. P. Cassidy, St. Louis.
R. M. J. Paynter, Richmond.
J. W. Tillinghast, Buffalo.
C. W. Henderson, Boston.

Members will remit through them, as far as may be convenient, and avoid, as much as possible, sending small amounts through the mails. Members in large cities will continue to remit as heretofore. Agents will retain the money until the expiration of the thirty days from date of notice, when they will remit the whole by draft or otherwise.

Blank forms of application for membership, or for restoration, may be had of the agents, who will hereafter endorse them.

Members, in communicating with the Secretary, will always state the number of their certificate.

D. R. Downer, *Secretary.*

TELEGRAPHERS' INSURANCE ASSOCIATION.

The acknowledgment of receipt on any assessment is to be understood as an acknowledgment for all previous assessments.

Assessments 32, & 33.

Telegraph Promotion.—We learn that Mr. A. B. Smith, one of the senior operators in the office of the Montreal Telegraph Company at Hamilton, Ont., has received the appointment of Deputy Inspector of offices and removed from Hamilton to Toronto. The appointment was only known to his colleagues in the office Saturday morning, but with their usual rapidity of movement a committee of the whole arranged to entertain him at a supper that evening, and the affair came off at 8.30 P. M., so as to allow all connected with the office to be present. Mr. Black, the Manager of the office, presided, and on his right sat the guest of the evening. From the remarks of the chairman and other speakers, we gather that Mr. Smith has been about eleven years in the company's service—the last three having been spent in Hamilton. He leaves this office with the best wishes of all the employes, who, while regretting his departure, rejoice in his promotion.

VOL. VI. NO. 2. NEW YORK, DECEMBER 16, 1872 WHOLE NO. 123.

GOLD AND STOCK REPORTING INSTRUMENTS.

For a long time prior to 1866 those engaged in buying and selling gold and stocks in the New York Gold and Stock Exchanges realized the inconvenience attending the procurement of the prices ruling in the market at a time when they were unable to be present. The only means they had for obtaining them at their offices was through messengers. It can readily be seen how unsatisfactory and unreliable quotations were when obtained in this manner. At a period of excitement in the market, with prices fluctuating at almost every bid, the figures brought by the messenger were frequently very far from those ruling at the moment of his arrival at the office, and yet this was the best that could be done.

Early in 1866, Mr. S. S. Laws brought out an instrument for reporting the fluctuations of the gold market, which was adopted by the gold exchange to announce to its members at the Board the official prices. The instrument worked satisfactorily, and

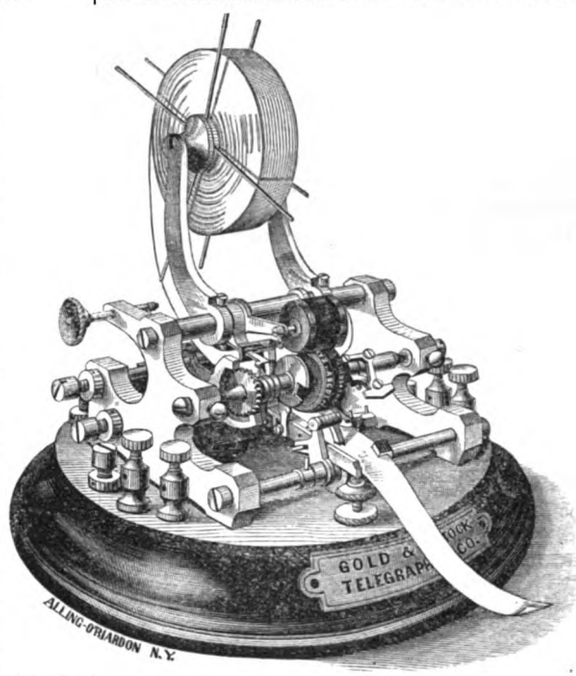
THE CALLAHAN STOCK PRINTER.

was soon after introduced into the offices of various members of the Board; and, as the instruments in each office were in the same electrical circuit with the recorder at the exchange, each change exhibited upon that instrument was shown at every office.

The Laws' machine worked upon the step by step dial principle. It had no index or pointer, but the dials themselves were rotated. There were three dials to each machine, each dial being worked by a separate and independent magnet. There were also three wires, one for each magnet. These dials were in the form of wheels, the rim of which only was in view. Upon this rim were placed numerals; upon the two first the simple figures from 1 to 0; upon the third was all the fractions by eighths, from $\frac{1}{8}$ to $\frac{7}{8}$.

Upon the operator's desk at the exchange were three keys for opening and closing the circuit, each key being connected to one of the wires; and as many times as the operator broke and closed the circuit with either of the keys, just so many steps would the dial operated by it be moved, each pulsation carrying the dial forward one step, disclosing to view the figure in order.

In order to see how the right quotation would be made, it will be necessary to understand that the dials are set at zero. The quotation may be called 39¾. The operator breaks and closes the circuit with the first key three times. This causes the first dial to rotate three steps, leaving the figure 3 in view. With the second key he breaks and closes nine times. This causes the second dial to move nine steps, leaving the figure 9 in sight; then with the third key he makes six pulsations, which stops the third dial at ¾; and, as the dials are placed side by side, the whole figure 39¾ is made. Each subsequent change would be made by sending pulsations sufficient to carry the dial to the desired position, when the required figure would be displayed.



The operation of this machine was entirely visual, no printed record being made for reference.

The success of this instrument being assured and the results obtained being so great, many busy minds at once became engaged in perfecting a machine which would report the quotations of the stock market. In this, however, it was necessary to have a printed record. The large list of securities dealt in utterly precluded the use of a visual telegraph; as, in order to keep the names and quotations in proper shape, a separate dial instrument, with three wires to each, would be necessary for each stock called. One can imagine the appearance a broker's office would present with from fifty to one hundred of these dial instruments, with their 150 to 300 wires therein.

In 1867, Mr. E. A. Callahan, then an operator employed by the Western Union Telegraph Company at New York, invented an instrument, operated with three wires, which exactly filled the requirements. A company was formed which speedily introduced them. In this instrument, although the results obtained were different, there were some points which apparently infringed upon the invention of Mr. Laws, and litigation became probable. To prevent this, the rival interests were merged into one, and a new company was formed under the name of the "Gold and Stock Telegraph Company." This Company employed the Laws Instrument to report gold quotations and the Callahan to report stocks.

The accompanying cut presents an accurate illustration of the Callahan instrument as now used.

This instrument has been greatly improved since its introduction; the principal feature being that the main current now entirely controls the action of the receiving instrument, instead of, as formerly, repeating the pulsations by means of a local battery in each office. The construction and operation of this instrument is very simple so that only a very brief description of its parts and manner of working will be necessary to enable the reader to fully understand the principle. As before mentioned, three wires are employed—one each for two electro magnets engaged in moving two type wheels, and one to effect the printing. Upon one of these type wheels are all the letters of the alphabet and upon the other all the units of figures and the fractions by eighths. These type wheels are upon different shafts, but placed side by side; beneath them is a ratchetted pad carrying a narrow strip of paper from a continuous roll. This pad is upon a lever, upon one end of which is an armature, which is, at the will of the operator, attracted by a third electro magnet, connected to the third wire. The movement of the type wheels is effected in precisely the same manner as that of the dials of the Law's in-

UNIVERSAL STOCK PRINTER.

strument, they being moved step by step, each step bringing a new letter or figure forward, and upon the desired one being arrived at, an impression is taken. At the operator's desk is placed a series of metallic points, arranged in a circle. There are two of these, one for each of the wires which control the movement of the type wheels. These points correspond in number and in position with the letters and figures upon the type wheels, and are marked for the convenience of the operator, with letters or figures in the same rotation. Within this circle is placed a moveable arm so arranged that the operator can close the circuit by contact with the metallic points. As these points correspond with and control the movement of the type wheels through the action of the electro magnets, it will be plain that at what-

Digitized by Google

ever point the operator allows the contact to become permanent, the letter upon the type wheel corresponding to the metallic point being brought to the desired position, it is firmly held, and upon closing the circuit of the third wire the pad is thrown against the wheel and the paper receives an impression of the letter.

The operation of this instrument can now be easily understood from the following description. The Stock to be quoted may be called Western Union Telegraph, and the price eighty-two. In order to economize time the names of the stocks are abbreviated as much as possible, the abbreviations being of such nature as to be unmistakable and readily understood.

To report the quotation of this stock the operator brings the movable arm in the centre of the first circle of metallic points, to the point marked W., being careful to make perfect contact with the intermediate points, so as to ensure by the successive impulses of electricity, the rotation of the type wheel to the proper position. The stoppage of the arm causes the wheel to become, as it were, locked. The circuit of the third wire is then closed, and the paper is brought against the letter and an impression taken. The arm is then carried to a point corresponding with the stop or period upon the type wheel, which is similarly impressed upon the paper, and is then taken to the point representing U., and then again to the stop or period, impressions being had in each case. Thus far the name W. U. is recorded. The movable arm within the second circle of points is now rotated under similar conditions to the point corresponding with the figure 8, upon the second type wheel, and then to the point representing 2, and, impressions being taken, the whole quotation stands recorded upon the paper, "W. U. 82." The types are inked by an ink roller which rests upon the type wheel and which is rotated by the friction caused by the motion of the latter.

A large number of instruments for reporting purposes have been brought out from time to time, all of which, of any value, are owned by the Gold and Stock Company. One of these instruments, the "Universal Stock Printer," is used upon several of the circuits operated by that company. The operation of this instrument is, like the Laws and the Callahan, upon the step by step principle, but in no other particular, except that two type wheels are employed, is there any resemblance. With this, two wires only are necessary, one to operate the two type wheels and the other to effect the printing. By a peculiar arrangement the type wheels may be shifted so that one magnet will control both.

We present upon the preceding page an exact illustration of the Universal Stock Printer, as now operated.

This instrument works on two wires, and performs two operations, to wit: Rotation of the type wheel and the impression of the letter.

One electro magnet with an armature secured to a double-toothed lever, acting on a toothed wheel, rotates the type wheels step by step. This magnet is placed on one wire, and is called the type wheel magnet.

Another magnet, acting upon an armature secured to the printing lever, effects the impression of a letter, shifting of the type wheels and feeding of the paper. This magnet is placed within the second circuit, and is called the printing magnet.

There are two type wheels, one having letters, the other having figures and fractions. Both wheels are immovably fixed upon a tube which slides endwise upon the shaft carrying them. These wheels are carried around with the shaft by a pin placed in a notch of an arm secured to the shaft. This arm is called the "crook piece." The shifting mechanism is also secured to this arm.

The shifting of the type wheels is effected by rotating them to a point where the shifting lever is directly over the shifting pins, extending upwards and secured to a plate upon the side of the printing lever, the upward motion of which throws the type wheels over to one side or the other, according to the shifting lever over the pins. In shifting the type wheels the shifting lever is so adjusted in relation to the characters upon the type wheel that when they are rotated to the dot after the "&," and the printing lever raised, the figure wheel will be thrown into a position to be printed from; and when the type wheel is rotated to the dot next to the letter "A," and the printing lever raised, the letter wheel will be thrown into a position to be printed from, a brass shield on each side of the pad preventing the type wheel which is not being used from coming into contact with the paper.

The type wheels are provided with a notched disc, which rotates with them. Upon the left side of the printing lever is an arm having a V shaped point. This, in conjunction with the notched disc, is used for the purpose of locking the type wheels to the side to which they may have been shifted, and prevents them from jarring out of position when they are being rotated. There are but two points where the type wheels are free to move either way, which are when they are at dot, and in a position to be shifted, and when the notch in the disc is opposite the V shaped arm.

This instrument is also provided with mechanism whereby any number of them in a circuit may be brought to a given point by the transmitting operator.

This is done by turning the transmitter four times around without printing, when an arm working in a worm or screw upon the type wheel shaft is carried in the path of a pin, stopping all the type wheels at the dot next to the letter A. By closing the printing lever circuit the arms are all thrown away from the stop pin, and the type wheels are free to move.

In operating these systems it is important that when the required amount of battery necessary to work each circuit is established, to maintain the same power of current so long as the operation is continued.

The amount of battery required to work each instrument (after enough battery has been put on to overcome the line resistance) is two carbon cups when the type wheels are rotated at a speed not exceeding 18 revolutions per minute; two and one-half cups when the speed is between 18 and 30; and three cups when the speed is not more than 42 revolutions per minute; or, in other words, to increase the speed of the instruments you must increase the battery power. The proportionate increase of speed and battery will in most cases be as above.

COMPLETION OF THE WEST INDIA AND PANAMA TELEGRAPHS.—MAGNITUDE OF THE ENTERPRISE.

The completion of the West India and Panama Telegraphs, which was commenced by Sir Charles Bright in 1870, brings the West Indies, Central and South America into telegraphic connection with the United States, and through them, with all countries where telegraphic systems are in existence.

The cable sent out for this arduous undertaking was 3,600 miles in length, weighing upwards of 8,500 tons, and was divided between seven large vessels, and the magnitude of the enterprise, which included the laying of sixteen separate cables under greatly varying depths and conditions, and in several cases during rough weather is unequalled in the annals of telegraphy.

Many difficulties had to be overcome, especially in laying the shore ends, and providing land lines through dense forests, while the deleterious nature of the climate led to a loss of a number of the staff.

Owing to the irregular character of the bottom, varying from two to upwards of 2,000 fathoms, four types of cable had to be employed, the first or shore end, weighing sixteen tons to the mile, and the other respectively five tons, 2½, and 1¼, the last being covered with galvanized homogenous iron wire akin to steel. The shore end cable has two massive coverings of galvanized iron wire laid spirally in opposite directions, and all the kinds of cable are further covered with two servings of yarn and Bright and Clark's compound as a protection against the teredo navalis and other marine insects.

The cables unite Havana at one end of Cuba with Santiago, and Santiago with Jamaica, whence they extend on the one hand to Colon, and on the other to Demerara, linking up Porto Rico, St. Thomas, St. Kitts, Antigua, Guadeloupe, Dominica, Martinique, St. Lucia, St. Vincent, Barbadoes, Grenada, and Trinidad.

Starting from Havana, which was previously in connexion with Florida, the line passes across the Island of Cuba to Batabano, where the submarine system commences. From this point, for about 100 miles, the cable is laid along a tortuous course in very shallow water, passing between rocky islets and coral reefs, and the coast being imperfectly surveyed previously, it was necessary to make a most careful study of the bottom, and to sound over the whole of the route to find a soft and safe bed for the cable. The type of cable used on this section being of the heavy class a great deal of manual labor was needed, and it was also requisite to employ a number of small vessels of light draught.

After passing Cienfuegos the line was laid in deep water along the Cuban coast to Santiago, and the cable was landed amid much rejoicing. The next section laid was to Jamaica, landing it at Plantation Garden River, a work of great difficulty. The west length commenced was that between Jamaica and Colon, where there is a land telegraph across the Isthmus to Panama. The line is one of great importance, and as the traffic and mails from the whole of the western coasts and South America and the central States, comprising Peru, Chili, Columbia, Venezuela, Costa Rica, &c., concentrates at Panama. Shortly after the expidition started from Colon northward, yellow fever broke out on board the Dacia; three of the cable men were buried at sea, and many others were on the sick list. The weather became bad, preventing observations, when about 300 miles from Colon a fault was discovered a short distance from the ship, and in endeavoring to pick it up an accident happened, and the end of the cable was lost. Rough weather followed, and interfered with grappling observations. Upon the return of the Dacia to Kingston a number of the cable staff died from yellow fever, and many others had to be invalided home; and as it was in a bad season of the year for grappling work, it was decided to go on with eastern sections, and then return to the Colon line.

The next length completed was between the islands of St. Thomas and Porto Rico, and in succession the rest of the lengths were laid down to Demerara, where, owing to the shallowness of the approach and the liability to ships anchoring over the route, the unusual length of 35 miles of the heavy shore-end cable was submerged, partly from schooners, as the steamer's draught was too great to allow her to approach within 10 miles of landing-place.

The cable which had been lost between Colon and Jamaica was picked up by Sir Charles Bright on the 11th inst., from a depth of 1,400 fathoms, in latitude 13.58, longitude 7.82. It was then joined up to Jamaica, and the whole of the lines are now in working order.

INSULATOR TESTS.

In a test of glass insulators of the Compromise pattern, where the tie wire is attached to the center of the insulator, after one year's exposure and during a heavy rain, the resistance per insulator was found to be 4,030,000 ohms; and during a heavy fog 11,000,000 ohms.

In a test of glass insulators of the new Western Union pattern, after an exposure of one month, tested during a thirty-six hours' rain, the resistance per insulator was found to be 49 megohms.

In a test of the Pond insulator, under the same circumstances, and with a similar exposure, the resistance per insulator was found to be 850 megohms.

A test of the same glass insulators, after a forty-eight hours rain, showed a resistance of 30 megohms per insulator, and Pond's insulator, under the same circumstances, gave 525 megohms per insulator.

ELECTRICITY AT THE STEVENS INSTITUTE—NOVEL RESEARCHES BY PROFESSOR MORTON CONCERNING THE INDUCED CURRENT.

From the Scientific American.

The first of a course of public lectures on electricity was recently delivered by Professor Morton, at the Stevens Institute of Technology, Hoboken, N. J., before a large and intelligent audience.

The lecturer introduced his subject with a few simple, but suggestive experiments, showing the attraction and repulsion of pith balls and gold leaf very plainly, by throwing their magnified image on the screen. He mentioned that although glass was the substance generally used as an insulator, it was not by any means perfect for the purpose, and pointed to a series of Leyden jars, which were entirely useless as a reservoir of electricity, owing to the poor insulating power of the glass.

Vacuum tubes were passed among the audience, each tube having sealed within it a smaller tube, with bulbs blown along each inch of its length; in the space between the smooth outside and the bulbed inside tube, was placed an ounce of mercury; on suddenly inverting the instrument, the mercury, in its descent, would strike against the bulbs of the inner tube, producing friction, and consequently electricity, of which the effect could be seen as a violet or purple colored light following the mercury.

The subject of electrical induction was next introduced, with a simple instrument called the electrophorus, and a Holtz machine; then followed a series of experiments with induction coils. A Giessler tube was caused to revolve rapidly by means of a small magnetic engine. When the induced current was transmitted through the revolving tube, it produced the effect of a handsome piece of fireworks. A wire, with strips of paper fastened at one end, was connected with the inner coating of a Leyden jar. On charging the jar with the long sparks of induced electricity from the induction coil, the strips of paper would be repelled and stand out from each other, but on discharging the jar they would instantly drop. A chime of bells was rung on the same principle, and would continue to ring for twenty minutes with one charging of the jar.

Professor Morton mentioned that he believed he was the first to discover that the induced or secondary current of the Rhumkorff coil was capable of producing attraction and repulsion, similarly to frictional electricity.

An electrical orrery was set in motion by the induced current escaping from points and reacting on the air; a lighted candle, held near one of the points, was almost blown out.

The speaker closed the lecture with some brilliant experiments with the large coil of the Institute. Wood was torn up and gunpowder was only scattered with one electric flash, which lasted the six billionth of a second, but ignited by another of longer duration, about six or eight hundredth of a second. The last experiment, that of causing the induced electricity to penetrate blocks of glass, was received with well deserved applause; the assistants brought in two heavy columns of glass, each having a metal rod running through its middle; thick varnish was poured on the top face of one column, and the block of glass to be penetrated placed on the varnish. More varnish was then poured on the block and the other column placed on the top. The principle was simply to bring two very well insulated electrodes together with the block of glass between them; the object of the varnish was to render the path through the glass the easiest course for the electricity. The terminal wires of the secondary coil were connected with the rods in the columns of glass. It was very interesting to observe the effect of the strange force struggling through the glass; the electricity would penetrate perhaps an eighth of an inch, and then, as if the resistance were too great, it would dart back and run around the outside of the block, turning the corners and scattering the layers of varnish; then again the current would make a new attack, penetrate deeper and deeper, until at last the bright streams of light passing entirely through the glass announced the electrical success.

The Professor exhibited a block of glass three inches thick (penetrated in this manner), by throwing the light through it and on the screen; two plainly marked cleavage lines showed the electric path through three inches of solid glass.

THE message of the President was received at the *Press* office yesterday afternoon and evening. It contains 11,335 words and was transmitted over the Western Union Telegraph wires. It commenced to come into the Troy office about 1:35 o'clock, and was all received at 7 o'clock last evening. It was taken from four wires by four operators. They deserve uncommon praise for the manner in which they did their arduous work. The message was divided into four parts at Washington, and each part lettered and transmitted over a different wire. The prompt and precise manner in which this message was received and sent out from Troy is not an exception to the general rule of the excellently managed office of Superintendent Prescott. The Treasury report made 9,000 words.—*Troy Press, Dec.* 3.

THE Delaware and Hudson Canal Company has recently completed a new line of telegraph from Carbondale, Pa., to Susquehanna, thus connecting its lines from Honesdale south with the line from Binghamton to Albany.

CORRESPONDENCE.

HOW TO INCREASE THE CIRCULATION AND USEFULNESS OF THE JOURNAL.

To the Editor of the Journal of the Telegraph:

The Journal of the Telegraph has been a great promoter of system, and were it withdrawn we could better know its immense value to the company. It does not do every employé all the good possible, but it does behoove the company to see that every employé read the official columns pertaining to this kind of employment, yet there are hundreds of them who *do not* because they *cannot* without becoming subscribers.

The paper reaches every W. U. Manager; but in large offices there are many employés beside the manager.

In my office I had nine on the pay-roll, and to secure the end deemed desirable, I wrote upon the margin of the paper the name of every employé, requesting each to cancel his name after reading the monthly circular. The messenger boys did not fail to receive any useful information to be gleaned. I think it would be money in the company's pocket to present every employé with a copy who does not now receive one, except, perhaps, the messengers who can be provided for in the manner indicated when there is anything which the company's interest demands they should understand.

The number required to carry out this idea is not so great. The offices where there are more than two employés are those which need one or more papers, in addition to those now furnished. The District Superintendents have all the data requisite.

Many operators who now fail to read the paper, even if they get a chance, would read it. Some feel that if they must pay for information, which it is to the interest of the company they receive, the company will wait a long time before they receive it. If each can take a copy home in his pocket, I think its usefulness will increase sufficiently to defray the increased expense.

RELIEF.

To the Editor of the Journal of the Telegraph:

Some time ago in your paper was propounded the question "why are there more blanks No. 1, than No. 2, used;" etc.

There are a number of reasons.

First—Such offices as New York and St. Louis copy all *through* business on printed blanks Nos. 1 and 44.

Second—Thousands of messages emanating from railway officers are written upon other than the company's blanks, but are delivered upon No. 1 blank.

Third—The majority of small offices do not carry out the rule requiring that every message be written upon or attached to blank No. 2 or 45. This item must amount to from 5,000 to 15,000 per day.

The amount of wasted blanks No. 1, as compared with wasted No. 2, must be small—I mean sheer, culpable waste where no use is gotten out of the paper; but the amount of blanks No. 1 used everywhere is far in excess of necessity, and is one of the results of the fallacy in the minds of the employé that it makes no difference to *him*.

TRAVELER.

MANCHESTER, VT., NOV. 23, 1872.

To the Editor of the Journal of the Telegraph:

Please answer the following inquiry:

Richard Roe sends message to Boston from Manchester, with orders to have answer come back "Collect," but before said answer reaches Manchester Mr. Roe has left town and gone to New York, where he resides, but before starting directs operator at Manchester to forward the answer, when it is received there, to New York, and he (Roe) will pay all the charges in New York on delivery of message. Message to be collected on contains ten words; tariff from Boston to Manchester is fifty-five cents, and tariff from Manchester to New York is seventy cents. Query: How should Manchester make check? Please give exact wording, and oblige,

L. C. ORVIS, Manager.

Answer.—Rule 8 says:

"That in case a person leaves town before the arrival of an expected message, and it is forwarded to him, you will include as part of the message the name of the place where it originated, and the date."

Counting the date three words, the check for New York should be: "13; collect 85 and 55; *via* Manchester, Vt." Then take credit for yourself as having paid 55 cents to "other lines."

SOME SILVER LINING.

To the Editor of the Journal of the Telegraph:

Thackeray tells an amusing thing, in "Pendennis," of a book reviewer whose line of policy was a little unique. On receiving a work for review, his first move was to dispose of it at a book stall, enjoying the result of the sale, and then prepare to dispose of the book in a most summary manner. In an article in the issue of the JOURNAL of December 2d the writer pays his respects to the "Telegraphers Mutual Life Association" in straightforward phrase, if not in what seems to me a just and generous spirit. Unlike Thackeray's hero, he does so, too, in the presence of abundant information, printed in the shape of a report elsewhere in the same number of the JOURNAL. But in presuming to condemn certain things, he is as much abroad as the reviewer in question; for, if I am not in error as to the author, he has never taken the trouble to attend the meetings of the Association, and is consequently as little in sympathy with the essence of those gatherings as our English critic was in the tenor of the book which he bartered and then proceeded to "butcher"—we quote the word from Thackeray—without having so much as peeped at the sentiments inclosed within its taseful binding.

"There has got to be a radical change in the administration of affairs," says this disciple of Voltaire, "in order to enlist the sympathies and interests of those whose sympathy and co-operation it is desirable to obtain." * * * * * "In the present condition of affairs the members of the association located in the vicinity of New York, virtually control its action and policy, and while this remains no progress need be looked for elsewhere."

As well might we look over our prosperous land, behold its vast industries, its commerce and agricultural thrift, and say:—"The government at Washington must cease to be, else we are ruined." It is necessary, I think, that the association should have a central power, and why not at New York? There is no cause for alarm; the Association's strength and practicability increases with its growth, and its growth is healthful and rapid. The payments to the heirs of deceased members are prompt, and the assessments are regularly paid. The platitudes "prejudice is blind, and had much better be conciliated than opposed;" if each district, through its representatives, had a vote at the annual meeting, sectional jealousy would be disarmed," and the glittering generalities, "the present system is too loose." "Not until the whole membership, in some practical manner, has a voice and a vote, will the Association embody the entire fraternity," are singularly *in apropos*, while the agency scheme, suggested in the JOURNAL, is unworthy the attention of any thinking or judicious man.

This is the case: The Association commenced with a handful of members, and from the first the very best men obtainable have engineered its affairs. Its increase of members is so large that two men are infinitely inadequate to the emergency of transacting its business, and extra assistance is sought and obtained. The meetings are held once a year, and are attended by the very cream of the profession—by such men as A. B. Chandler, Walter Lewis, A. S. Brown, A. S. Downer—and the affairs amicably adjusted for the coming year. Moreover, the Association has an Executive Committee composed of men of pronounced integrity, to whom questions of importance arising any time during the year, are referred and acted on, to the seeming satisfaction of those interested in the Association.

In a word, the Association is moving forward, developing into a state of perfection as time wears on, and if in any particular it has not reached the meridian of its glory and usefulness, and is tarrying in the twilight, let it be remembered that it is the twilight of the morning and not of the evening.

MACQUE.

NASHVILLE, TENN., NOV. 26, 1872.

To the Editor of the Journal of the Telegraph:

Our insurance association is a good thing and doing good, but it seems as though it might, by being spread over larger field, be made more useful. The practice of the association dismemberships those who fail to pay their assessments, thus losing members, and withdrawing from many needy persons the benefit the association might otherwise do them. Many, and I believe the greater number of those failing to pay their assessments, fail through lack of money. A dollar or two to the majority in the fraternity is of no object, but where "jewels," like the Roman matron's, have been freely given, there are other and more crying wants than to pay assessments. Would it not be wise, and of more benefit to a larger number, to adopt a system in general use by life insurance companies, of issuing something of the character of a paid-up policy to those who are obliged to discontinue their membership, and so wishing, such policies entitling heirs to amounts equal to the number of assessment paying members at the time of application for a paid up policy, the amount, when necessary, to be assessed upon members holding certificates of lesser number than that of deceased, or otherwise as thought best. In case parties who had withdrawn from the association wishing to rejoin, allow them to do so without paying back dues, as now; but stipulating in such case that if it became necessary, the amount paid him should be minus, the numbers of certificates issued during the time elapsing between the withdrawal and regaining, or that payment of back dues should entitle them to some privileges, as they would be, had they never withdrawn.

To further extend the benefits of association would it not be well to allow those so desiring to take out the second certificate, that is one person holding two certificates—and limit it by two, for one person—paying assessments for both and in case of disease. The heirs to be paid double assessments, or two premiums. These ideas put into practice would probably make more clerical force necessary for keeping the accounts of the Association, but it wouldn't be much and could easily be met by light special assessment.

CERTIFICATE 1,449.

Digitized by Google

To the Editor of the Journal of the Telegraph:

Your article in last JOURNAL, asserting a lack of interest in the Insurance Association among members in New York and elsewhere creates some surprise. If the JOURNAL would print one tithe of the letters that reach us, filled with expressions of approval and commendation, or could you hear the many words of cheer spoken to the officers, the assertion would probably never have been made.

We work quietly, without newspaper parade, and accomplish our good work in a manner satisfactory to those who most have the well being of the organization at heart. You make an error in stating the annual meeting adjourned *sine die*, unless adjourning to the next regular annual meeting is adjourning without a day. "A radical change in the administration of affairs" sounds large and exhaustive, but rather reflects on the present executive committee and officers, under whose direction comes the management. They certainly have the confidence of the forty members who usually attend the annual meeting, else their election would not be so unanimous.

I venture to say no one will question their personal fitness, or who will assert they have "an axe to grind."

In regard to moving the headquarters elsewhere, I am not opposed to it, if the majority of members desire the change. It's for them to decide, but until we are organized somewhat differently it is wise to leave it where it is.

The trouble is, we are working on too economical a basis. There is sufficient work connected with the office of secretary to occupy one man's whole time, and in order to develop the association properly provision should be made for this work. It is absolutely impossible for one who has other duties to attend to, to perform the work of secretary, even with the assistance he can get with the small allowance authorized at the last annual meeting.

The plan you suggest in regard to districting the country by states is impracticable at present. It would necessarily complicate the working machinery of the association, which must be avoided under an economical way of doing things.

The plan which has been adopted and already partially carried into operation is to appoint agents for certain sections, permitting them to form their own districts, not consulting geographical boundaries, but with regard only to the convenience of their communication with members. A district by this plan would be made up of lines of railroad and telegraph diverging from an agency. Members, after a while, would find it convenient to do all their business through an agent, instead of directly with the secretary, by which means it is hoped that his labors would be materially lessened. We will be glad if any sufficient number of members in any section would unite upon one of their number to act in such capacity, and if there is no objection he will be recognized by the officers as a regular agent.

Very explicit instructions have been sent to agents about endorsing applications. They understand that while it is desirable that the operation of the Association should be in some degree charitable, yet justice to a very large membership scattered throughout the whole country, require us to be very careful to whom certificates are issued. No one in ill health, or whom the agents think would be an unreasonable risk, or whose habits are bad, who drink habitually, or who does not sustain a fair reputation, is to be recommended.

The case you mention where a certificate was issued to an applicant in the last stages of consumption, never existed within the knowledge of the secretary and treasurer.

We may have been imposed upon in a few isolated cases during the first year or so of our history, by too kind hearted managers or superintendents approving ineligible application, but every precaution has lately been, and will hereafter be used, to protect the association from imposition of all kinds. For this reason we are trying to confine the endorsement of those applying to join us, to agents as much as possible, and already good results have come from the practice.

Herewith I send some letters, from which I hope you will make extracts for publication. They are only specimens of what we are continually receiving, and have come to us within a few days. They will help to prove that there is no lack of interest in our organization outside of New York, whatever may be thought of the practicability of the suggestions made.

D. R. D.

A communication from a member of the Insurance Association in Vermont contain some very excellent suggestions. For the protection of a member against a loss of the benefits of membership by an apparent delinquency, owing, among other causes, to the loss of remittances sent through the mail, the sender being ignorant of such loss, he says:

"My plan for doing this would be to publish all new assessiments occuring within a month on the first day of the succeeding month, allowing, as now, thirty days for payment. At the end of twenty days publish a list of delinquent certificates to that date—instead of the list of *receipts* as now—which would give *honest* and *earnest* members sufficient time in which to duplicate any remittance not received in season to avoid the penalty. Causes why not received in the first instance could be afterwards investigated and differences adjusted. To preserve the life of the association, neither deed of omission nor of commission should be allowed to jeopardize the validity of a certificate if it can be shown that the member is honest in his purpose to preserve his membership intact. Membership should be of life tenure, and such should be the clear conviction of every applicant before he assumes its obligations to the association.

The plan of district agents seem to me an excellent one, for it will remove many of the difficulties naturally arising from territorial distance from the officers of the association, and want of action and earnest co-operation of many of its members."

As to physical elegibility and the power of an endorser to abuse the confidence of the association, he goes on to say:

"Another matter seems to me of vital importance to the success of the association—the physical elegibility of applicants for membership. Do we guard sufficiently against imposition in this particular? 'Tis evident that we *have* not, if the statement of our 'Organ' is correct; and I know from personal experience that there is daily opportunity for *mistakes* to be made on the part of those whose indorsement of the applicant is taken as sufficient evidence of his elegibility. There are many influences which *might* impair the judgment of these persons, oftentimes contributing to *blindness*, preventing a clear *understanding* of, or statement of the fact. In some instance this blindness might be counted a *virtue*, charitable, and even creditable, but as a rule of the association should not there be a fixed guard against imposition? In my opinion every applicant should be required to furnish the certificate of a reputable physician that after a thorough examination he is found to be in generally good condition of physical health. Not make the test so strong as to debar the acceptance of applicants on merely technical or frivial causes, but make the elegibility of applicants so clear that the association may not be imposed upon by assuming the risks upon a life already flagging. That the association may not be charged with doing injustice to future applicants through the operation of such a rule, in that it necessitates increased expense, I would suggest that a certain portion of the 'Reserve Fund' be set apart and applied to the payment of the costs of such certificates. This would be appropriating so much of this surplus fund to the general and direct good of every member of the association in its protection against imposition."

A correspondent in Illinois, in remitting for assessments numbers 34, 35 and 36, closes his letter in the following kind and sensible manner.

"This is a pretty heavy draw on me at once, but in consideration of the good cause, I hope I am able to stand it, as none of us know how soon we may be similarly situated and have to ask the same thing. I am surprised to find as many delinquents in the association as reported. Operators are a pretty hard set to hold together in one common union without a big delinquent list. I know that by experience, but they are doing first-rate in the Life Association, and I hope that they may always do so well, and better, if possible."

Another remitter, writing from Illinois, thinks that it is

'Coming rather thick; still it is a pleasure to feel that we are assisting the needy."

To the Editor of the Journal of the Telegraph:

In the front part of the book of rules, which was superseded June 1st, 1870, was an invitation to each manager to communicate to the secretary, if any of the rules following did, in his opinion, work against the interest of the company.

In the present book this invitation does not appear. Will you please to tell *us* why it was left out?

It was, no doubt, seldom if ever acted upon, still it was a door which ought never to have been closed. It presented the *opportunity* to do good, and you can imagine how much less good would be done than is done were all palpable opportunities withdrawn.

There are men who do good without being asked, and there are those who do no good unless pointedly solicited so to do. There are also those who only lack the opportunity.

MISSOURI.

A. C. Will appear in our next. Shall be glad to receive your communications.

TELEGRAPHING BY SOUND THROUGH WATER.

In 1828 Sturm and Colladon made a series of experiments at Lake Geneva, Switzerland, to determine the rate of transmission of sound through water. The sounds were produced by striking a bell suspended from a boat at a suitable depth in the water, while the observers were stationed in another boat at a distance and received the sonorous impressions through a long metallic tube, the lower end of which was closed by a membrane and immersed at a considerable depth in the water. In these experiments the bell weighed about one hundred and thirty pounds and the sound was heard at a distance of about 14,000 yards.

During the recent siege of Paris the attempt was made to obtain telegraphic communication with the provinces by this device of transmission of sound through water, and the Minister of Public Works confided the necessary experiments to M. Lucas, who reports the following results: The experiments were conducted as in the former instance and made in the river Seine. Two bells were employed, one of about eighty pounds and the other of seven hundred pounds weight. In the case of the first the sound was transmitted to a distance of about 1,800 yards, while in the case of the second or larger bell only to 1,500 yards. There was, therefore, no advantage gained by the increase in the size of the bell—in fact there was a loss. The great diminution in the distance to which the sound was conveyed in his experiments is accredited by M. Lucas to want of depth in the waters of the Seine as compared with those of Lake Geneva.—*Nature and Science; Scribner's for December.*

MARANZONI and Stefanelli have discovered that a film of an essential oil on the zinc plates of a voltaic pile has an effect similar to that of amalgamation, preventing local action to a certain extent. It diminishes the quantity and intensity of the current at the commencement of the action, rendering it for a certain time more constant, but stopping it entirely after two or three hours. In like manner the evolution of hydrogen by the action of zinc on dilute sulphuric acid is quickly arrested by the addition of an essential oil, but is recommenced on adding alcohol.—*Scribner for December.*

4..... 2.25
5..... 2.50

Half-rate messages may be taken for and received from Molino, Fla., the new office opened on other lines.

WILLIAM ORTON, President.

CUBA CABLE BUSINESS.

Tariff and Rules for Cuba Cable Business.

This order contains complete instructions concerning Cuba Cable Business, and supersedes all previous orders relating thereto. All messages must be pre-paid.

To take effect January 1, 1873

Tariff, in Gold, Between Havana and the United States and British Provinces.

	For Ten Words.	For each Additional Word.
To or from Havana, Cuba, and any office of the Western Union Telegraph Company, in the United States, east of the Mississippi River, including St. Louis, Mo.....	$5 00	$0 40
To or from any office of the Western Union Telegraph Company, west of the Mississippi River, except St. Louis, Mo.....	7 50	0 75
To or from any office in the United States not on Western Union Telegraph Company's lines add, in gold, the local tariff of the connecting Company from the point of connection with the Western Union Telegraph Company to the point of origin or destination.....		
To or from Offices in Canada.....	5 50	0 45
To or from Offices in New Brunswick and Nova Scotia.....	6 00	0 50
To or from Offices in Newfoundland.....	7 50	0 65

Official Messages of the Spanish and United States Governments will be charged less than the above rates by $1.75 per each message of ten words or less, and eighteen (18) cents for each additional word. All such messages must be signed officially, and the prefix "G" must precede the check.

On messages to HAVANA and to the following named offices in Cuba, beyond Havana, collect, in addition to the foregoing rates, the Spanish local tariff, viz.: Forty (40) cents, gold, for ten words or less, and forty (40) cents, gold, for each additional ten words or fraction of ten words.

Batabano,	Los Palacios,
Bejucal,	Los Punas,
Bemba,	La Mulata,
Bocu Du Sagua,	Matanzas,
Bayamo,	Mariel,

Cuba,	San Diego De Nunez,
Guanaja,	Trinidad,
Guainaro,	Union De Reyes,
Guines,	Villaclara.
Jiguani,	

RULES.

I. CHECK:—The check includes:
1. The number of words in the entire message.
2. The amount charged.

Great care must be taken to correctly check messages, Managers of offices will be held personally responsible for failures to observe this.

II. COUNT:—The date, address, and signature must be included in the count, and paid for. The sender is entirely responsible for non-delivery when either date, address, or signature is omitted.

Compound names of places, including names of countries, states, islands, cities, towns, etc., and compound words (as shown by standard dictionaries), will be charged as one word. Two-pence, three-pence, and up to eleven-pence, count as one word in each case.

Names of individuals, firms, vessels, streets, and all other names, count for as many words as are employed by the sender to express them.

Initial letters, decimal points, bars of division, underlines, and signs of punctuation, count as separate words; and great care must be taken to transmit them precisely as written by the sender.

Numbers in all messages, except cipher, must be written out in words. Figures are prohibited in plain and code messages, unless they are used to duplicate numbers previously written out; in which case, they are counted for as many words as are used to express them.

The sender is responsible for an insufficient address, and in no such case will inquiries as to delivery be made free.

III. CODE AND CIPHER:—CODE AND CIPHER MESSAGES ARE PROHIBITED BY THE SPANISH GOVERNMENT, and will only be forwarded at senders' risk as to delivery. If delayed or suppressed by the Government, the tolls will not be refunded.

CODE MESSAGES are composed of words found in ordinary dictionaries or gazetteers, but disarranged, or having a secret meaning.

CIPHER MESSAGES are composed of figures, letters, or words, not contained in dictionaries or gazetteers, or a combination of either, or all, constructed for secrecy.

Count *Cipher Messages* as follows:

Add together all the figures, letters, characters and signs; divide the total by five, and the quotient (plus one for the remainder, if there be any) is the number of words to be charged for as cipher.

The date, address, signature, and any other portion of the message that is written in ordinary words, whether code or plain, will be counted as in ordinary messages, and added to the number of words found in the cipher text.

One-half in addition to the ordinary rates will be charged for the whole number of words in cipher messages.

IV. REPEATED MESSAGES:—The sender of a message can have it repeated over the wires of this Company by paying a half-rate additional; in which case each receiving office will repeat to each sending office as it passes. The words "*repetition paid,*" must be inserted immediately after the address, and must be charged for.

Should the receiver of an ordinary message require it to be repeated on account of supposed error, the application for repetition must be addressed to the sending station. Such application and repetition must be treated as two distinct messages, and be prepaid. Should an error on the part of the telegraph be discovered, the charges for the application and repetition will be returned.

V. PREPAID REPLIES:—The sender of a message may prepay the reply as follows:

The sender must insert immediately after the address, the words: "*Reply, —— words, paid.*" The number of words paid for will be written in the blank space, and all must be paid for. Should the reply contain more words than the number specified, the sender of the reply, on presenting it for transmission, must pay for the excess. The reply must be tendered not later than eight days after arrival of original at delivery station.

If an answer of only ten (10) words is prepaid, it is sufficient to insert in original message: "*Reply paid.*"

In cases where more than one reply is required and prepaid, the sender must state the number of replies, thus: "*Three replies, paid;*" or, if more than ten (10) words, thus: "*Three replies, each —— words, paid.*"

VI. MESSAGES FOR POINTS BEYOND HAVANA:—All despatches to points in Cuba, beyond Havana, are required by the Spanish Government to be written in the Spanish language, and this Company will take no responsibility on such messages, if forwarded in any other than the Spanish language.

VII. MESSAGES FOR POINTS BEYOND TELEGRAPH LINES: Messages destined for places beyond the lines of telegraph, must contain instructions from the sender as to the places from which they are to be posted. Such instructions must be inserted immediately after the address, and charged for as part of the message.

Twenty-five (25) cents, gold, must be charged for postage in such cases.

VIII. COMPLAINTS:—All complaints respecting irregularity in the transmission or delivery of messages, must be made by the *sender* only, and addressed to the administration or company to which the messages are handed for transmission.

They must be accompanied—

1st. By a declaration in writing from the receiving station, or the person addressed, if the message has not been delivered.

2d. By the copy of the message as delivered, if it has been mutilated or seriously delayed.

The total charge for any message which has failed to reach its destination, or which has been seriously delayed through the fault of this company, will be refunded. All claims for refund of tolls must be forwarded to the Treasurer, New York, with the statement of complaint, as above. The tolls will in no case be refunded, without instructions from headquarters.

WILLIAM ORTON, President.

" 35. " 576

FOREIGN TELEGRAPHIC ITEMS

SUBMARINE TELEGRAPHING.

From Paris we have the announcement of a most important contribution to the Vienna Exhibition in the shape of a new method of submarine telegraphing, which leads us to expect a thorough transformation of the one now in use. The most eminent men of professional science in the branch, such as Phillipps, Spinelli, Culigny, Tosselli, and others, have pronounced favorably upon the subject; and, according to the opinion they have given, the electrical current will be rendered useless on long distances by substituting for the cable the tube of Ferdinand Tommasi, into which water is introduced, and the telegraphing performed by atmospheric pressure. A copper tube thus filled will be subjected to atmospheric pressure at one end, and the effect at the other end is instantaneous. A pressure of 250 atmospheres will be necessary for telegraphing at a distance of 4,000 kilometres, the diameter of the hollow space in the tube being 2½ millimetres. The copper tube will be incased the same as the cables now in use. Most surprising results have been shown at Paris with a length of tube of 500 metres, in the presence of practical men in telegraphic matters.

THE manufacture of the duplicate French Atlantic and Great Western cables is steadily progressing; of the former about 700 miles are already coiled on board the Great Eastern, and the electrical condition of the cable is all that can be desired.

THE new General Post Office in London is now approaching completion, and steps are being energetically taken for the transfer of the head telegraph station there; wires are being laid in every direction, and a large system of pneumatic pipes laid down.

THE Indo-European Telegraph Company have given notice that they are now again accepting messages for India, China, and Australia, their special lines *via* Teheran, interrupted by the late unusually severe storms in North Germany, having been repaired and placed in good working order again.

THE total number of messages forwarded from Postal telegraph stations in the United Kingdom, during the week ended Nov. 9th, 1872, was 211,075, an increase on the corresponding week of last year of 62,055.

STATEMENT showing the total number of messages forwarded from Postal Telegraph Stations in the United Kingdom during the week ended the 16th November, 1872, and during the corresponding week of 1871. Week ended November 16th, 1872, total number of messages, 306,951; week ended November 18th, 1871, total number messages, 259,238; increase in the week of 1872 on that of 1871, 47,713.

THE report of the directors of the West India and Panama Telegraph Co. states that the receipts for the year, almost entirely derived from the eastern section of the line to Demarara, amounted to £27,950, and the expenses, including interest, to £19,471—leaving a balance of £8,479. Legal proceedings, however, are still pending between the company and the contractors for the cable.

ADVICES from Jamaica to the 23d November, state that communication between that place and Aspinwall by cable, has been interrupted. The break has been located at a point 160 miles from Aspinwall and the place has been carefully marked. An attempt to raise the cable, in order to make the necessary repairs, proved unsuccessful, and the company is now awaiting the arrival of new and improved grappling gear from England.

A PROPOSITION is mooted to connect Macao and Hong Kong, China, by telegraph.

ACCORDING to the *Patria*, of Lima, of the 22d of October last, Congress has authorized the Government to grant a subsidy of 20,000 soles for the extension of telegraphic communication from Payta to Panama, to form a union with the submarine cable just laid between Colon and Jamaica.

THE French are practicing, in the hilly country around Paris, the erection of military telegraphs. In the Buttes Chaumont Park, recently, where the cliffs and rocks are of the steepest, fifty soldiers of the engineer corps laid a perfect labyrinth of wires, and sent messages over all of them in half an hour.

THE Assembly of Victoria has been informed by the Chief Secretary that the Government will submit to Parliament before the end of the Session a proposal to subsidise the overland and cable telegraphic communication with India and Europe with the object of making a general reduction upon the cost of through messages.

THE STEARNS DUPLEX IN CANADA.

The Montreal Telegraph Company are introducing the Stearns Duplex quite extensively on their lines. A circuit of 250 miles, between Montreal and Toronto, and two other circuits, respectively between Montreal and Ottawa, and Ottawa and Toronto, have already been equipped with the apparatus; and another circuit will this week be opened between Montreal and Quebec. Instruments are now making for the Montreal and Sackville, N. B., circuit of about 800 miles, and others will be added as rapidly as possible. The instruments are from the well-known establishment of C. Williams, Jr. of Boston, and are of excellent workmnaship.

PRESENTATION TO MR. J. F. MORRISON.

Upon the recent marriage of Mr. J. Frank Morrison, Night Manager of the Western Union Telegraph office at Baltimore, Md., his associates in the office presented him and his bride, Miss Irene C. Sifford, of Frederick, Md., with a handsome silver tea set as a mark of their esteem and regard.

Mr. M. D. WOODFORD, who has lately resigned the position as chief of the telegraph department of the Michigan Central Railroad to accept that of Assistant General Superintendent of the Great Western Railway, was recently presented with a handsome bookcase, filled with choice books, valued altogether at about $600, by a number of the employees of the Michigan road.

C. L. LE BARON, for many years President of the Pensacola Telegraph Co., has gone into the commission and exchange business in Pensacola, Florida. Mr. Le Baron was one of the first in the South to join the Insurance Association, and has always evinced much interest in its prosperity. If success in his new business depended upon the good will of his telegraphic friends he would have nothing to complain of.

THE Union Pacific Railroad is to be congratulated in having secured the services of Mr. W. C. Langdon as train dispatcher at Laramie. Mr. Langdon has had considerable experience in regulating the movement of trains, he having been dispatcher at Burlington, on the C. B. and Q. R. R. With his professional qualifications he takes to his new position the reputation of being a gentleman of culture and courtesy.

BY an unaccountable error we announced in the Service Report of September, published in the JOURNAL of December 1st, the resignation of Mr. George W. Flagg, manager of the Newport, R. I., office. Mr. Flagg has not resigned nor does he intend to do so. Long may he wave.

Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, DECEMBER 16, 1872.

REPORT OF THE POSTMASTER-GENERAL.

The Postmaster-General's recent report to Congress contains an elaborate argument in favor of the governmental acquisition of the telegraphs, accompanied by statistics purporting to show the comparative cost of constructing, maintaining and operating telegraph lines in this country and in Europe.

In the Postmaster-General's report for 1871 he made a similar recommendation, accompanied by an argument in favor of the acquisition of the telegraph lines in this country, based upon the wonderful success of the post-office telegraphs in England, which, he asserted, yielded a net revenue of $3,391,954 for the fiscal year ending March 31, 1871—the first year of its operation. An examination of the official report made to the British Government showed, however, that the entire receipts of the telegraph department of Great Britain, from the commencement of governmental control on the 1st of February, 1870, to the 31st of March, 1871, a period of fourteen months, were only $3,865,127, and that the expenditures for the same period were $6,763,362, being an excess of expenditures over receipts of $2,898,235. This remarkable discrepancy was commented upon in Congress and in the public press, and yet, up to the present time, Mr. Creswell has neither made any acknowledgment of his error nor attempted to defend the correctness of his statement.

We do not suppose that Mr. Creswell made this gross misstatement intentionally, but that he either mistook the gross receipts for the net revenue, or was imposed upon by some one employed to supply him with information upon matters relating to the telegraph, but we cannot refrain from expressing our surprise at his failure to allude in any manner to this remarkable discrepancy in his present report.

We now propose to examine the statements and statistics relating to the Telegraph contained in the Postmaster-General's report for 1872, with the view of ascertaining whether they are any more reliable than those of the previous year. The report commences with a statement of Mr. Creswell's action in fixing the rates for official telegraphic despatches in compliance with the provisions of the Act of Congress, approved July 24, 1866, which rates, so far as they apply to Signal Service messages, he says, were objected to as too low by the Western Union Telegraph Company.

"The Western Union Telegraph Company," says the Postmaster-General, "contended, first, that the Signal Service messages, which, to be effective, require simultaneous transmission through special circuits, at certain times, were not covered by the Act of 1866, and could only be sent by special arrangement; second, that the understanding under which the company had been transmitting such reports was not intended to be continuous, but was terminable, at the pleasure of the company, at the end of a year from May 24, 1871, when the company gave notice that it would discontinue the service unless a higher rate should be allowed therefor. On both of these points I took the opposite ground, maintaining the right of the Government to require the transmission of the weather reports, under the Act of 1866, and also asserting the permanent character of the assent of the company to this construction of the law. In view, however, of the representations of the company as to the insufficiency of the compensation previously allowed, and acting on the recommendations of General Myer and Mr. Whiting, I advanced the rates for Signal Service messages from two to three cents per word for each circuit over which they might pass, in accordance with the plans of the Chief Signal Officer."

The company did not take the ground that the signal service messages, or any other class of Government messages, were exempt from the operation of the Act of 1866, but that the provisions of the Act conferred upon the Postmaster-General simply the authority to fix the rates, and not to dictate how the wires of the company should be worked, nor at what hours of the day or night the offices should be opened. Much effort has been made by interested parties to misrepresent this matter, but the question is a very simple one and can be easily comprehended.

Section 2 of the Act of July, 1866, reads as follows:

"And be it further enacted, that telegraphic communication between the several departments of the government of the United States and their officers and agents shall, in their transmission over the lines of any of said companies, have priority over all other business, and shall be sent at rates to be annually fixed by the Postmaster-General."

Under the assumed authority of the above act the Postmaster-General fixed the rates for the year commencing July 1, 1871, as follows:

The rate for all telegraphic communications, other than Signal Service messages and reports, was fixed at one cent per word for each circuit of 250 miles, or fraction thereof, through which it should be transmitted.

"The rate for Signal Service messages and reports at two cents for each word for each circuit over which it may pass, in accordance with the schedule of circuits and plans of the Chief Signal Officer of the Army, which are now adopted or may hereafter be adopted by him for transmitting these despatches, or such part thereof as he may designate, in such words or cyphers as may, from time to time, be directed by him. The amount thus estimated is to be taken in full payment for said despatches, no additional allowance to be made for drops, office messages, or other services or special facilities required by the Chief Signal Officer for the correct and prompt transmission of the said Signal Service messages and reports."

Now, is it possible that any unprejudiced person, can be found who will maintain that, under the authority granted to the Postmaster General in the above act, that officer was authorized to fix separate rates for different classes of government messages; or that, having fixed these different rates, he had the additional right to delegate to the Chief Signal Officer of the army the authority to arrange the circuit over which messages should be sent at the rates fixed by him? or that, having fixed the rate for signal service business at two cents a word per circuit, irrespective of length, he had the additional right to require that the company should transmit office messages, make drops, and perform all other services required by the Chief Signal Officer, free of charge?

It will not be contended, surely, that the authority to annually fix the rates gave the Postmaster-General the power to compel the company to send messages without any compensation, or to build lines when required by the Signal Office without reimbursement.

The truth is, that the compensation for the peculiar facilities afforded to the Signal Office was fixed by agreement between the Western Union Company and that department, and although it was deemed inadequate by the representatives of the company, it was accepted partly because of their desire to contribute to the success of a scheme, which, it was believed, would prove of benefit to the public, and partly because of representations on the part of the Signal Office that the appropriation would not justify greater compensation.

The Signal Service business was new and peculiar. It required the exclusive occupation of from twenty to thirty of the principal circuits, varying in length from 250 to 2,500 miles, three times in each twenty-four hours, and the dropping of the messages transmitted thereon at each signal station. In addition to the occupation of these important circuits, extending throughout the United States, for the transmission of the weather reports, the Chief Signal Officer represented that it was necessary that he should have at his disposal special circuits between Washington and New York, Washington and Chicago, and Washington and New Orleans. These circuits were required to be connected with the Signal Office at 7.45 A. M., 4.45 P. M. and 11.45 P. M., daily, and at such other times as the Signal Officer should call for them. The Signal Service had been in operation but a short time, however, when it was ascertained that these special circuits were being put to other uses than the correction of errors in reports and other matters connected with their transmission. It was found that they were being taken for purposes of display, as well as for the obtaining of trivial information, such as the hours for the departure of trains, the hiring of operators, the procurement of vaccine matter for the prevention of small pox, etc., etc., during the most crowded hours of the day, when they were most useful to the public, and, therefore, most valuable to the company.

The authority of the Postmaster-General to fix the telegraphic charges for government messages, under the Act of 1866, was not denied, but the company did not admit the right of that officer to control its wires, to direct when and how circuits should be made up, and to dictate the routes by which messages should be sent to their destination. Nor did it admit the right of any officer of the government to order its

Digitized by Google

operators to open their offices at unusual and inconvenient hours in the morning, and to keep them open at night until the permission of some other government official to close them had been obtained. The position of the company upon this point was clearly and unmistakably set forth by the president of the company in the proceedings of the committee on Appropriations at Washington, March 29, 1872, in the following words which we quote from the report of that committee :

"I have conceded the right of the United States to require anything to be sent by telegraph, to anybody, anywhere within the reach of our wires, and at any time that our offices are accessible for that purpose. I distinctly disclaimed the position that there is anything about the messages of the signal-service that excludes them from the provisions of the act of 1866. The Chief Signal-Officer may file in the Western Union Telegraph Office any number of messages, directing them to be sent to as many stations as, in his judgment, it is necessary for the public service that they should reach ; and it is competent for the Postmaster-General to fix a rate to every station in the United States to be applied to that business ; but then and there his authority in the premises ceases. I take those messages and—exercising the utmost diligence, and being the best judge as to which wires I shall employ to do the work, and what is the most expeditous route between the initial and the terminal stations, or as to how many of several routes shall together be employed for that purpose—I must deliver these messages at their destinations. But that we shall keep an office open all night at some places and open half the night at other places, and shall open one at five o'clock in the morning, and another at six, and another at seven, in order that they may all be in telegraphic communication at the same instant, and that we shall connect the War Department or the Signal-Office with our main office, and permit its officers to control our wires, is a right which, with great respect to the Postmaster-General, I deny to have been conferred under this act."

The Postmaster-General was present when this matter was before the Committee and took part in the discussion. He was, therefore, not uninformed in respect to the position assumed by the Company.

Following the discussion of the Signal Service difficulty, the Postmaster-General presents an argument in favor of the monopoly of the telegraph by the government, and of its constitutional power to acquire and operate it, copied from the report of the Committee of Ways and Means, published in Vail's History of the Electro-Magnetic Telegraph, Washington, 1845, and adds, that "owing to the slowness of the public to recognize the advantages of the new invention, and the doubts cast upon the feasibility of its operation over long distances, the course recommended by the committee was not adopted, and the line built, and for some time maintained at government expense, was turned over to the holders of the patent."

The assumption that our government has afforded any material aid in the development of the Telegraph is incorrect. So far is this from being true, there is probably not an instance in the history of any country where the government has so persistently neglected or impeded an enterprise of such national importance. With the single exceptions of an appropriation of thirty thousand dollars, made by Congress in 1843, for an experimental trial of the Morse telegraph, which was entirely expended in the construction of the line beween Washington and Baltimore, and of a subsidy of $40,000 per year for ten years, granted to the constructors of a line from the Missouri river to the Pacific Ocean, over which all government business was entitled to priority and free transmission, the government of the United States has never paid a single dollar for the development of the telegraph. But, on the contrary, it has forced the telegraph companies to pay into the national treasury upon their gross receipts, within the past ten years, over one million five hundred thousand dollars, the greater proportion of which has been paid by the Western Union Telegraph Company.

"If the effects of rivalry between the telegraph and the mail upon the revenues of the Post Office have not been serious," says the Postmaster-General, "it is due alone to the liberal management of the latter as compared with that of the companies, a management which, since the invention of the telegraph, has reduced the rates of postage from twenty-five to three cents, and increased ten-fold the correspondence of the country. The natural policy of private companies is to extend facilities slowly and only to profitable points, to let their business augment gradually, and to reap large profits from a small number of messages, while a government system, managed in the interests of the people, pursues exactly the opposite course. Had the policy of the Post Office been adopted by the telegraph companies, or had the government held to the old rates of postage, the telegraph, instead of now transmitting one-fiftieth part of the annual correspondence of the country, would probably transmit at least one-tenth."

We think we can show that the Postmaster-General's conclusion is erroneous by referring to the practical operation of a telegraph system of the kind which he proposes, where the uniform rate is twenty-five cents instead of thirty-three, as he asks authority to make them. In the United Kingdom of Great Britain and Ireland, the number of letters delivered in 1870, according to the official report, was 831,914,000, and the number of telegrams sent by the Post Office Department was 10,084,020, being an average of one telegram to eighty-five letters, instead of one telegram to fifty letters, which Mr. Creswell says is the proportion in the United States. Now, if Mr. Creswell's theory is correct, and the British telegraph is all that he claims for it, there ought to be an annual transmission of 85,714,170 telegrams in that country, or eight and a half times more than they actually transmit.

The next argument brought forward by Mr. Creswell in favor of the governmental absorption of the telegraph, is based upon the improvements in telegraphy produced by the introduction of Stearns' Duplex Telegraph, and "the countless other applications of electricity to the transmission of intelligence yet to be made, which must, sooner or later, interfere most seriously with the transportation of letters by the slower means of the post."

Now, it seems to us, that, as the assumed object of the acquisition of the telegraphs by the government is the extension of facilities and the cheapening of rates, the government ought not to complain of the development of these facilities by private companies; and moreover, that while the government transmits letters at three cents each, the telegraph companies must make enormous strides on the road of progress before they can compete successfully with the post.

The next position assumed by the Postmaster-General is that the telegraph is defective and abuses exist which call loudly for reform ; that the system has grown up with, and by the side of railroads, and has naturally directed itself to profitable and easily accessible districts ; that the tariffs are exorbitant ; and that large districts are totally unprovided with telegraphic facilities.

These complaints are substantially the same as those made several years ago by Messrs. Gratz Brown, E. B. Washburne, C. C. Washburn, Gardiner G. Hubbard, and other advocates of governmental interference in telegraphy, which have been successfully answered and refuted again and again ; it being clearly shown that telegraphy was better and more satisfactorily performed in the United States than in any other country in the world.

Following the above mentioned stereotyped complaints, the Postmaster-General calls attention to a table containing telegraphic statistics partially furnished "by Mr. George Sauer, an American gentleman, residing in Europe, who has made the subject of government telegraphs a special study."

We have heard of this Mr. Sauer before. It was from him that Hon. E. B. Washburne obtained the statistics upon which he based his speech on the union of the telegraph and postal system delivered in the House of Representatives in 1868. It is to him that Mr. Hubbard, another advocate of postal telegraphy, acknowledges his indebtedness for European statistics, while Hon. C. C. Washburn, in his speech on the postal telegraph bill, delivered in the House of Representatives Dec. 22d, 1869, says "I have been greatly indebted to George Sauer, Esq., an American gentleman, residing in Paris, for many of my facts regarding European telegraphy."

As Mr. Sauer's statistics seem to have been the foundation, or tap root, of all the postal telegraph schemes which have been started in this country since 1868, and as the statements relating to telegraph matters of all the gentlemen who derived their information from Mr. Sauer had been almost invariably incorrect, pains were taken to obtain a copy of Mr. Sauer's compilation, for the purpose of instituting a comparison between his statistics and those contained in the official reports, and a review of Mr. Sauer's telegraph statistics was published as an appendix to the argument of Hon. William Orton President of the Western Union Telegraph Company, on the bill to establish postal telegraph lines, delivered before the select committee of the United States House of Representatives in 1870. This review, which was of the most complete and scathing character, showed that Mr. Sauer not only manufactured many of his pretended statistics, but misstated and garbled the official reports, and wholly perverted the facts respecting the cost of European telegraphy.

Referring to the comparative cost of transmitting

Digitized by Google

telegrams in the United States and in Europe, the Postmaster-General says:

"The table shows that with a cost per mile for construction and equipment, much lower here than in Bavaria, France, Great Britain, Italy, and the average of Europe, and about equal to that in Belgium and North Germany, and with the yearly expense per mile of line which will compare most favorably with that of the countries mentioned, the telegraph in this country collects an average of seventy cents on each message, against an average of sixteen cents in Bavaria and Belgium, twenty-eight in France, twenty-nine in Great Britain, thirty-two in Italy, twenty-two in Germany, and thirty-eight in Europe generally."

Without stopping to discuss the first remarkable assertion in the above paragraph that the cost of constructing and equipping telegraph lines is much lower in the United States, with its high duties, inflated currency and costly labor, than in Bavaria, France and Great Britain, which seems scarcely worthy of serious consideration, we think we can show that the remainder of the statement is incorrect.

Upon examining the Postmaster-General's statistical table, which purports to give the general statistics of the telegraphs in Europe and the United States, we find many errors, the tendency of all of which is to increase the apparent rates in the United States and to diminish those of Europe. In the United States, according to Mr. Creswell's table, 13,700,000 telegrams were transmitted (including nearly 2,000,000 press messages), the receipts upon which were $9,590,000, which, it will be observed, makes the average charge precisely 70 cents. Now, amounts stated in round numbers are always liable to suspicion. If it were true that exactly 13,700,000 messages were sent, for $9,590,000, thus making the average rate precisely 70 cents, it would be a curious fact. It looks, however, as if there had been some estimating in the matter. Let us examine the facts, with a view of ascertaining whether this suspicion has any substantial foundation.

In October last the President of the Western Union Telegraph Company, at the request of the Postmaster-General, furnished a statement of the operation of the company during the fiscal year ending June 30, 1872, containing the following statistics:

MESSAGES.	
Number of paid messages sent during the year	10,271,935
Partially paid and free messages.....	660,303
Press Messages.....	1,512,361
Total number of messages.....	12,444,499
RECEIPTS.	
For transmission of messages.....	$7,040,803.53
For transmission of press reports.....	979,083.71
For transmission of market reports.....	107,579 72
For transmission of weather reports.....	137.522.88
From all other sources.....	192,105 93
Total receipts.....	$8,457,095.77

In the list of disbursements, also furnished to the Postmaster-General, were two items covering the amounts paid other lines, and refunded and uncollectible, amounting to $220,395.75, which amount is of course, properly deductible from the receipts, thus leaving the actual receipts for the transmission of messages, exclusive of press and weather reports, $6,820,407.78. No estimate nor account was made of the number of weather report messages transmitted. The number of press messages was stated in the letter to the Postmaster-General, as an estimate made by dividing the number of words sent for the press, by 30, which was taken as about the average number of words in ordinary commercial and social messages. The number of messages stated does not include messages sent by or for railroad companies between stations on the line of the roads nor service messages of the telegraph company.

Excluding from the account, both the estimated number of messages sent for the press and the receipts therefor, the account will stand thus: Number of messages sent, exclusive of press and weather reports, 10,932,138. Receipts for transmission of messages, $6,820,407, showing the average rate per message 62 cents, instead of 70 as stated in Mr. Creswell's report.

These statistics furnished by the President of the Western Union Telegraph Company, the Postmaster-General has not seen fit to publish, although he says that the figures given in his table, under the head of the United States, "are derived from estimates based upon data furnished by telegraph companies controlling over nine-tenths of the lines in the United States."

We have shown from the figures officially furnished to the Postmaster-General, that the receipts for the transmission by this company of 10,932,318 messages amounted to $6,820,407.78, and for the transmission of 1,512,361 estimated press messages, $979,083.71, making a total of 12,444,499 messages, and $7,799,491.49 in telegraph receipts.

Deducting the messages sent by the Western Union Company from the total number stated in Mr. Creswell's table as having been sent by all the companies in the United States, and deducting also the telegraph receipts of this company from the total telegraph receipts of all the lines, and this curious and most remarkable result follows: That the opposition lines sent during the year only 1,255,501 messages (of which nearly 500,000 were press messages), for which they received $1,790,508.51, being an average of $1.42 per message.

When it is considered that the opposition lines mainly extend over short routes where competition is popularly supposed to have greatly reduced the rates, we think the above exhibit is sufficient to show the incorrectness of the Postmaster-General's table.

On examining the table, containing his European and American statistics, we are struck with the different standpoints from which the statistics are exhibited. While in the United States a message is only counted once, whether it is transmitted one hundred or four thousand miles, it is counted in Europe over and over again, in each petty state through which it is transmitted. In this manner the apparent number of messages is greatly increased above the actual number sent.

While in the United States there is but one class of messages, there are in Europe three classes, called, respectively, internal, international, and transit. The internal messages are those which are transmitted, received and delivered in the same country. The international messages are those which are transmitted from one country into another. The transit messages are those which are neither sent nor received in the country in which they are reckoned, but are simply shot through it in going from one state to another. In this way small states like Bavaria, Belgium, Baden. etc., which really send but a small number of messages, are able to show an apparently large annual traffic. Countries so situated in Europe as a rule have adopted a low rate of charges for their internal messages, the deficit being made up by a tax upon international and transit messages paid by surrounding states. Thus, for example, Belgium charges a minimum rate of half a franc for the transmission, receipt and delivery of a message within her own territory, while she imposes double rates upon both international and transit messages, one class of which requires only one-half the service of an internal message—being simply either sent or received from or into the country—and the other class requiring no service at all, being simply sent through the air on its way from one neighboring state to another. The case would be analogous to that of one of our States which should set up an independent telegraph system of her own, and should charge a low rate for the transmission of messages within her own territory, and impose a heavy tax upon messages passing through her territory between the other States of the Union. Suppose the State of New Jersey, for example, was to establish an independent telegraph system, and fix the rates for messages passing within her own territory at the Belgian rate of ten cents, and then charge twenty cents for every message passing through her territory. The result would be very favorable to the finances of New Jersey, as the tax upon the correspondence between New York and Washington alone would more than pay the entire cost of her own system.

The Postmaster-General's table not only embraces paid internal and international messages sent and received, as well as the transit, but includes also the free messages sent and received. Thus, for example, in Bavaria the official report shows that there were transmitted in 1870, 295,170 internal and 197,018 international messages, making a total of 492,188. The receipts being $162,248, making the average rate about 33 cents. By including 219,992 received messages, 212,037 transit messages, and 85,929 free messages, the Postmaster-General's table swells the total number of messages to 1,010,176, thus reducing the average from 33 to 16 cents.

In Baden, according to the table, there were transmitted in 1870 629,291 messages, for $35,008, being an average of thirteen cents per message; while the actual number of messages sent in that country, exclusive of Government messages, was 337,443.

Digitized by Google

In Italy, according to the Postmaster-General's table, there were transmitted, in 1870, 2,378,119 messages, upon which the tolls amounted to $945, 234, making an average rate per message, as stated in the table, of thirty-two cents; but which, when properly computed, give thirty-nine and eight-tenths cents per message.

In regard to the returns for Great Britain, a table is compiled, accompanied by foot notes, stating that "complete returns for previous years not having been received, the estimates of the British Post-Office for the year ending March 31st, 1873, are used instead." Also, that "the messages and receipts are classified by an average obtained by counting one weeks' business;" in other words, that regarding the only country in the world which possesses a telegraph and postal system combined, no reliable statistics are furnished notwithstanding the fact that the Government of Great Britain has been in possession of the telegraph for three years.

A careful examination of all the governmental telegraph reports for 1870 shows that the number of messages transmitted during the year was 36,732,460, the receipts upon which were $16,584,187, making the average receipt per message of 45 cents, while the expenditures were $22,445,976, showing an average expense for transmission per message of 61 cents instead of 38 cents, as stated in Mr. Creswell's report.

Leaving for the present the question of rates for the transmission of messages, let us consider the statements in regard to the cost of constructing telegraph lines in this country and abroad.

"The majority of lines in this country," says Mr. Creswell, "have been built very cheaply; their entire cost, including patents, being probably much less than $10,000,000. Data in possession of this Department show that many lines have been lately built, probably not of the best quality, but fully up to the average standard, for not more than $115 per mile of single wire line, and $30 per mile of additional wire. For equipment an allowance of $5 per mile is ample. Were all the wires to be strung at the same time, as they would be were the present system to be duplicated by the government, the cost would probably be much less. The cost of a new system, equal in extent to the present, would, at the above rates, be $11,880,000."

The extent of the system, which Mr. Creswell states could be reproduced at a cost of $11,880,000, embraces about 80,000 miles of line and 200,000 miles of wire.

The only estimate accompanying the Postmaster-General's Report, going to show the cost of constructing a similar system in the United States, is one furnished by Mr. Charles T. Chester, of this city. In this estimate Mr. Chester gives the cost of constructing 75,000 miles of line, and 175,000 miles of wire, including equipments, at $18,253,625; *provided the wire is imported free of duty.* This estimate, which, by the way, *is not footed in Mr. Creswell's report*, does not include cables for river crossings, of which the Western Union Company, alone, has in operation 234½ miles.

Mr. Chester has achieved some notoriety as the manufacturer of a certain style of telegraphic apparatus, but, we believe, has never had any experience in constructing telegraph lines, with the single exception of the fire alarm telegraph of the City of New York. This system is embraced in the following inventory, for which we are indebted to the President of the New York Fire Department:

INVENTORY OF LINES AND APPARATUS BELONGING TO THE NEW YORK FIRE DEPARTMENT.

625 Miles of wire.
2,650 Telegraph poles.
2,500 Feet of submarine cable.
549 Street boxes.
84 Gongs.
16 Dials.
41 Keys and bells.
1,189 Cells of battery.
1 Recording register.
2 Repeaters.
2 Switch boards.
1 Testing instrument.
1 Wheatstone's measuring instrument.
60 Galvanometers.
175 Lightning arresters.
61 Morse relays.
61 Morse keys.
2 Police dials.
9 Sets (Morse key, relay and bell).

For the construction and equipment of the above system Mr. Chester rendered a bill against the City of New York, as we are officially informed at the Comptroller's office, of $850,000.

Now if 625 miles of telegraph wire costs $850,000, then 175,000 miles would cost $238,000,000.

625 : 850,000 :: 175,000 : 238,000,000.

If, however, we suppose that the estimate which Mr. Chester has rendered to the Postmaster-General is a correct one, and that 175,000 miles of telegraph wire costs but $18,253,625, then 625 miles would cost only $65,187.

175,000 : 18,253,625 :: 625 : 65,187.

In Mr. Chester's estimate for constructing government lines, which he proposes to erect for $104.30 per mile of wire, he includes 75,000 miles of poles, averaging 33 per mile, and making a total of 2,475,000 poles. In the line which he constructed for the City of New York, for which he charged $1,360 per mile of wire, he used only 80 miles of poles, averaging 33 per mile, or a total of 2,650 poles.

For the government line the estimate embraces an average of 14 poles per mile of wire, and the average cost of the line per mile of poles is $243.38.

The line constructed for the City of New York, however, averages but a fraction over two poles per mile of wire, and the bill rendered for it is at the rate of $10,625 per mile of poles. On this basis the cost of constructing 75,000 miles of line would be $796,875,000.

We leave the Postmaster General and Mr. Chester to settle the discrepancy between the two estimates.

In Mr. Creswell's statistical table, he states the cost of constructing each mile of telegraph line in the United States at $120, and each mile of wire at $30; while he gives the cost of each mile of line in England at $164, and each mile of wire at $41.22. The greater portion of the telegraph wire used in the United States is made in England. The price of Johnson & Nephews' "extra best best" galvanized iron wire at Manchester is £26 sterling per ton, or 5¼ cents per pound. The cost of the same quality of wire delivered in New York is 10½ cents per pound, the duties, freight, exchange, premium on gold and other charges, nearly doubling the cost of English wire when laid down in this country. We think, therefore, that Mr. Creswell's statement that each mile of wire in England costs nearly fifty per cent. more than in the United States, needs some explanation.

The sizes of telegraph wire used in the United States are of 6, 7, 8, and 9 gauge, none being employed smaller than the latter, while in Europe much of the wire employed in the telegraphs is of No. 11 gauge, the latter size weighing but one-half as much as No. 8, and costing proportionately less. No. 6 wire, of which there is a considerable amount used in this country, weighs 550 pounds per mile and costs $57.75 per mile, delivered in the city of New York. No. 8 wire weighs, in round numbers, 400 pounds per mile, and, at 10½ cents per pound, costs $42 per mile. No. 9, the smallest wire used in this country for telegraph lines weighs 340 pounds per mile, and costs, at the place of importation, $35.70 per mile. Now, by what kind of calculation is Mr. Creswell able to show that wire costing from $35.70 to $57.75 per mile at the place of importation, can be transported all over this broad continent and erected along the lines of the railway and post roads at an average cost of $30 per mile, including insulators, cross-arms, and other appurtenances?

In the Postmaster-General's table the cost of the English lines and apparatus to date is stated at $9,037,320. The official report of Mr. Scudamore, however, shows that the British Government paid for them £7,500,000 sterling, or $36,450,000 in American gold currency, and that he had expended up to the 31st of March, 1871, $4,486,166.96 in construction of additional lines. How much he has expended since we are not informed; but Mr. Creswell does not accord to the British postal authorities a very marked aptitude for bargaining, when he states that their whole system has cost less than one quarter the amount they paid for it.

In a note at the bottom of Mr. Creswell's statistical table it is stated that the cost of the lines and apparatus of the English telegraph lines is estimated at the average of Continental lines. Upon referring, however, to the estimated cost of the Continental lines, in the same table, we find it stated at $170.72, while the average cost per mile in England is stated at $164.88.

Regarding the statement, that the majority of lines in this country have been built very cheaply, and that they are of an inferior character, we would say, that of the 62,000 miles of poles belonging to the Western Union Company, over 50,000 miles are cedar and chestnut, the best timber in the

Digitized by Google

world for durability, and of the remainder 5,000 are of cypress and redwood. Of the 137,000 miles of wire in operation on the 1st of July last, 98,000 miles was galvanized. During the past six years the Western Union Company has expended $5,128,467.86 in the reconstruction and repairs of its lines, an amount which has fully maintained them in the best possible condition.

Referring to the rates charged by the Western Union Company, the Postmaster-General says :

"Incredible as it may appear, the official statements of the Western Union Telegraph Company show that their average receipt per message has been increased eleven cents, or nearly twenty per cent. since 1867, notwithstanding the undoubted reductions of tariff between important points."

On page 8 of the pamphlet issued by the Western Union Telegraph Company, on the proposed union of the telegraph and the postal systems, the following statement is made in relation to the traffic of 1867:

"The total receipts of the Western Union Telegraph Company for the above year were $6,658,925.36; but of this amount $521,509 were received for transmitting regular press reports on contract, and $308,788.40 from other sources, leaving only $5,738,627.96 for telegrams.

Of the 10,067,768 messages sent during the year, 8,004,770 were on commercial and social matters, and 2,062,998 containing special press news, the latter amounting to 75,359,670 words."

Now, dividing $5,738,627.96 by 8,004,770 messages would make the average rate 71 6-10 cents per message, against an average of 62 cents received during the past year, thus showing a reduction of over 9½ cents per message, instead of an increase of 11 cents, as stated by the Postmaster General. This statement, however, of the number of messages transmitted in 1867, was over-estimated. Up to that time no accurate record had been kept of the number of messages transmitted, and the statements published in relation thereto were, like those of the Postmaster General in his recent report, largely estimated. Since that date, however, accurate reports of the number of messages transmitted have been kept by the Company, and the result shows an average diminution in the rates for the transmission of messages of 23 8-10 per cent in 1869, 15 4-10 per cent in 1870; 16 2-10 per cent in 1871, and 16 8-10 per cent in 1872.

The Postmaster-General's report contains various ingeniously constructed tables, purporting to show the average rate of transmission upon the lines in this country and abroad, which serve to convey an erroneous impression of the average rates actually paid. We have not made a comparison between the pretended rates from Washington to the various stations named in the table, and the official rates, but assuming that they are correct, they by no means prove that the average charge is correct. If Washington, for example, sends the same number of messages to each of the thirty-two stations named on page 164, then the average charge per message would be ascertained by adding together the thirty-two separate rates and dividing the sum by the number of stations. For example, the charge from Washington to New York is 40 cents, and from Washington to Grenada, Miss., $2.70. The average of these charges is therefore $1.55, but it is probable that of every one hundred messages sent from Washington, ninety-nine will be sent to New York to one to Grenada. On this basis the average is forty-two cents instead of $1.55.

The Postmaster-General says that the experience of Switzerland and some other countries shows that a reduction of fifty per cent. in tariffs was followed by an increase of one hundred per cent. in business. Neither Switzerland nor any other country has made an average reduction of fifty per cent. upon its whole traffic, nor increased its business one hundred per cent. in any one year. The facts show that while some increase of business follows a reduction in the rates, the increase in the number of messages is much more nearly proportional to the increase of facilities. We cannot occupy the space in our present issue required for a careful and exhaustive illustration of all these points, but must leave that, together with many other interesting questions suggested by the Postmaster-General's report, for future consideration.

QUICK TELEGRAPHING.

The President's Message reached the telegraph office in Washington at twenty-five minutes past 1 o'clock. Within forty-five minutes, the shortest time ever attained with so long a document, it was transmitted to New York, Philadelphia, and Baltimore. Twelve wires were used, and the weather was favorable for working purposes. There were 11,339 words in the message. Within four hours after leaving Washington it was published in full in the evening papers and sold about the streets in this city.

SUBMARINE CABLES.

Cable property, after a long period of neglect, has at length come into marked favor with investors as well as with speculators. The successful reparation of the Australian cable has been the prominent cause of this—not merely on account of its being another proof that cable property is not any more precarious than any other, but because of the substantial increase it has given to the receipts of the Eastern companies, and most of all to the British Indian Extension, which line is said to be now earning 20 per cent. dividend. We long ago predicted that this line must be another Anglo-Mediterranean from the similarity of its position, and we expect that when the amalgamation of the lines beyond India takes place, the extension will, like the Anglo-Mediterranean, be taken in at double the amount of the others. We foresee no end of work for the Construction Company in the duplication of cables as traffic increases. In the case of the British Indian Extension, the extra traffic from the opening of the Australian line would alone pay for a cable, assuming the money to be raised at 7 or 8 per cent.—*The Railway News.*

NEW ELECTRICAL BATTERY.

M. Lionel Weber has invented a new battery, composed of a porous diaphragm filled with plumbago. This vessel is placed in a glass or porcelain vase containing a saturated solution of ammoniacal chlorhydrate. Into the plumbago is introduced a plate of charcoal which constitutes the positive pole; and into the solution which surrounds the diaphragm is plunged a plate of amalgamated zinc, forming the negative pole. This battery has been found to have great force, to be constant in the support of regular and continued work, to be economical, and to need but little attention.

VOL. VI. NO. 3. NEW YORK, JANUARY 1, 1873. WHOLE NO. 124.

LIGHTNING ARRESTERS.

Ærial telegraph wires are electrified by induction during thunderstorms, and become charged by currents of variable intensity and directions. When this accidental electrization is not too strong, the safety of the employes is not endangered, nor the apparatus exposed to any deteriation, the effects being limited to simple perturbations, which somewhat obstruct the passage of the voltaic currents and interfere with the transmission of messages. When the electric force developed on the line by a thunderstorm becomes considerable, however, the wires are traversed by currents sufficiently intense to throw the telegraphic apparatus out of service, sometimes the wires of the electro-magnets being fused by the passage of these accidental currents, and the iron bars of the electro-magnets become so strongly charged with permanent magnetism as to be rendered unfit for service. Still more serious accidents sometimes occur within the offices, where heavy discharges take place, which melt the connecting wires as well as those of the electro-magnets, and render the apparatus unfit for further use.

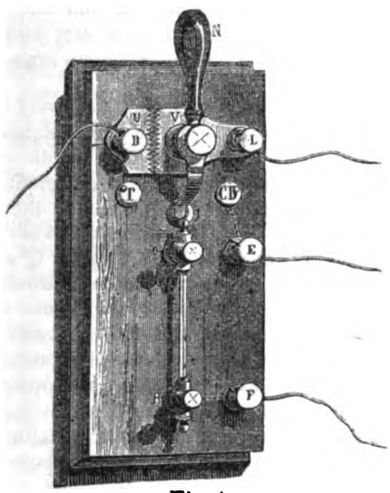

Fig. 1.

Various means have been proposed to preserve the apparatus from the reach of these accidental currents. On some lines abroad, the poles of the line are provided with tapering metallic rods, whose lower ends run into the ground, and which also serve the important purpose of carrying off the mixture of currents caused by imperfect insulation during rainy weather. These metallic rods, however, although efficient in protecting the poles, being isolated from the conducting wires do not shelter them from lightning nor preserve the stations from damage, occasioned by the passage of very intense currents.

The tension of voltaic electricity, employed in working telegraph circuits, is so small, that the current can only pass between conductors actually in contact, while that of atmospheric electricity, on the contrary, is so great as to enable it to pass across a considerable space of intervening air. Advantage has been taken of this principle to construct lightning arresters, or dischargers, to prevent injury to the apparatus during thunder-storms.

Figure 1 is an illustration of a simple lightning arrester, constructed by Mr. Breguet, which is very effective in insuring the safety of the instruments during the most violent thunder-storms.

Two metallic plates, U V, separated by a very small interval, and armed with points on their edges in juxta-position, are fixed on a small wooden board. The line wire terminates at knob L of plate V; the plate U has a knob B, whereon the ground-wire is fixed, and communicates with the button T. The plate V carries a commutator N, of which the metallic spring can at will be brought on one of the three buttons, T I C-D, which communicate the first with the ground by knob B, the second with ferrule G, the third with the knob E. Both ferrules G H are connected by a very fine iron wire, whose extremities are fixed on two small copper cylinders, kept back themselves by two strong screws. This iron wire is protected against accidental causes of rupture by putting it in the axis of a glass tube, or very dry wood covered with an isolating polish. Finally the ferrule H communicates with knob F, whereon is attached a metallic wire, that proceeds to the telegraphic apparatus of the station.

When the commutator N is on the button I, the line communicates with the apparatus of the station by plate V, the commutator N, the button I, the ferrule G; the iron wire, the ferrule H, the knob F, and its metallic wire. It is evident that the points of the plates V U can in no case convey the voltaic currents, used for the transmission of messages; these currents never having tension enough to cause a discharge at a distance. But during a thunderstorm, if the electric tension of the wire is very strong, a discharge will take place between plate V and plate U through the points in juxta-position, and the electricity accumulated by induction goes to earth without traversing the telegraphic apparatus of the office.

When the electricity accumulated by induction has not sufficient tension to be discharged from plate V to plate U, it flows away in the form of a current across the iron wire inserted between the ferrules G and H. If this accidental current has intensity enough to be dangerous, the iron wire, on account of its great resistance, is melted, and all communication is interrupted between the line and the telegraphic apparatus before the electric flow has obtained sufficient strength to injure them. When the iron wire is melted it must be quickly replaced, in order to re-establish the communication between the line and the telegraphic apparatus.

When a violent thunder-storm is to be feared, it is prudent to suspend all correspondence, which, moreover, is nearly always impossible under those conditions. Then the commutator N is pushed on the button T; the line is placed in communication with the ground through the plate V the commutator N the button T the plate U and the knob B, on which the ground wire is fastened, and the electricity accumulated by induction proceeds directly to the ground. The intermediate offices are provided with two lightning arresters symmetrically fixed on the same support. These two apparatus communicate in a permanent manner by a metallic wire fixed to knob E. When it is desired to establish direct communication without the current of the line passing through the apparatus of the intermediate office, the commutators N of the two lightning arresters are pushed on the buttons marked C D.

Starting from the same principles as Mr. Breguet, some constructors have proposed lightning arresters, which do not differ from the preceding one except by some modifications in the arrangement of the pieces. We will give a description of two of the models used on the French lines.

On the lower part of a wooden board (figure 2) are fixed three metallic limits, L T F. To the first is fastened the line wire, to the second the ground wire

X Z Y

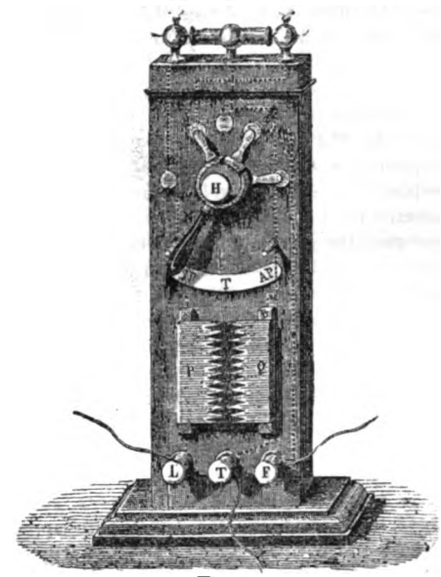

Fig. 2.

—to the third a wire, connecting with the telegraphic apparatuses. At the upper end of the wooden board are fixed two limits X Y kept in permanent communication by a very fine iron wire, surrounded by a silken envelope. This wire crosses the metallic cylinder Z, from which it is isolated by the silk. P Q are two metallic plates very near to each other, and toothletted on their edges in juxta-position.

The wooden board has besides four more buttons, *a b c d* and a commutator N with three metallic springs. The median spring only communicates with the metallic axis H of the commutator, the two lateral springs communicate with each other, and are isolated from the median spring, as well as from the metallic axis H.

Metallic bands fixed to the posterior face of the support and indicated on the engraving by dotted lines, establish the communications between the different pieces of the apparatus.

The binding screw L receives the wire and com-

Digitized by Google

municates in a permanent manner with plate P, the metallic axis H and the median spring of the commutator N. The binding screw T receives the ground wire and communicates permanently with plate Q, the button *e* and the metallic cylinder Z.

Binding screw F receives the wire of the telegraphic apparatus belonging to the station, and communicates permanently with the button *d*.

Binding screw X communicates with the button *a* and the limit Y with the button *c*, these two limits are connected by the isolated iron wire lodged in cylinder Z.

A metallic arc fixed beneath the commutator serves to determine the position, which ought to be given to the handle N, according to circumstances.

When the weather is not stormy, the handle N of the commutator must be pushed on the letters S P, then the median spring rests on the button *d*. In this case, the communication is directly established between the line and the telegraphic apparatus and the current does not traverse the iron wire lodged in the cylinder Z.

When a thunderstorm threatens, the handle N of the commutator is to be pushed on the letters A P; in this case the median spring rests at the button *b* and the lateral springs rests one on *a* and another on *d*, which they bring in communication. The telegraphic apparatus communicates still with the line, and correspondence can continue. In fact, the current of the line communicates with the button *b* by the median spring of the commutator, passes to the limit Y, traverses the iron wire, proceeds to the limit X, the button *a* and the button *d*, across the latteral springs of the commutator, and thence proceeds to the binding screw F, and to the telegraphic apparatus. But by this arrangement the apparatus is preserved from the disastrous consequences of the too intense currents which the atmospheric electricity develops in the line. When the electric tension is very powerful, a spark flashes out between the points of the metallic plates P Q, and the electricity goes to earth by the binding screw T without traversing the telegraphic apparatus. If the discharge is not effected between the plates P Q, the currents which are developed on the line being too intense, the iron wire inserted between the limits X Y, is either melted or has its isolating envelope burned up. In either case the communication is established by the inter medium of the iron wire, denuded or melted, between the limit Y, the cylinder Z, and the limit T, the currents going directly to the ground, and the telegraphic apparatus is preserved, but correspondence necessarily is interrupted until the iron wire inserted between the binding screws Y X is replaced.

If the thunderstorm is violent, any correspondence is impossible. Then the telegraphic apparatus ought to be completely isolated by pushing the handle N of the commutator on the letter T. The median spring of the commutator touches the button *c*; all the currents of the line immediately pass to the ground, across the plates G, and the binding screw T, the telegraphic apparatus is completely isolated from the line, and sheltered from any harm.

Figure 3 represents a third lightning arrester, built on the same principles.

The apparatus is entirely fixed on a vertical wooden board. The chief piece of this apparatus is a rod *i i'*, composed of three metallic cylinders *g f e*, isolated from each other by means of two ivory thimbles *h h'*. The intermediate cylinder *f* is enlarged in its medium part, and sunk in a channel at both its extremities. A very fine iron wire covered with silk is fixed to the upper extremity of the cylinder *e*, by means of a screw-knob *i*, and is coiled up on the cylinder *e*, lodging in the screw channels at the upper part of the cylinder *f*,—rolled up on its enlarged part, engaged in the channels of its lower part, rolled up on the cylinder *g*, and fixed to its lower part by means of the screwknob *i'*.

As long as the silken envelope is preserved the two extreme cylinders *e g* communicate by the iron wire, and remain isolated by the medium cylinder *f*. But, when the isolating envelope is destroyed, communication is established between the upper cylinder *e*, and the medium cylinder *f*.

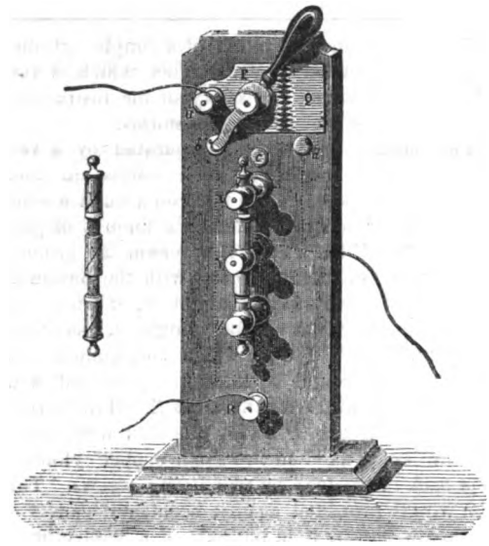

Fig. 3.

At the upper part of the wooden board are fixed two metallic plates P Q, very near to each other, armed with teeth on their edges in juxta-position.

Plate P has a knob *a*, on which the wire L is to be fastened, and a commutator with springs N. Underneath these plates are three buttons *b c d*. At the lower part of the wooden board is to be found a binding screw B to which a metallic wire F is fastened, which proceeds to the telegraphic apparatuses of the post.

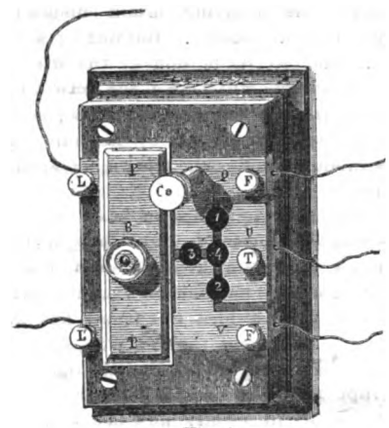

Fig. 4.

Finally the wooden board contains three large copper ferrules X Y Z. The median ferrule Y is armed with a hollow copper cylinder. The rod *i i'*, of which we have given the description, enters into these three ferrules, and in the copper cylinder of the median ferrule. Three screws serve to establish the communication of the three ferrules X Y Z with the three cylinders superposed *e f g* of the rod *i i'*.

The upper ferrule X communicates with the button *c*.

The lower ferrule Z communicates with the button *b*, with the binding screw B, and by the intermedium of this limit with the telegraphic apparatus of the post.

The ground-wire T is to be fastened behind the wooden-board, at the middle ferrule Y, which communicates besides with the button *d*, and the metallic plate G.

In ordinary weather, the spring of the commutator N is kept down on the button *c*. The line is then in communication with the telegraphic apparatuses of the office through the intermedium of the lightning arrester and iron wire. Moreover, as long as the iron wire and its envelope are untouched, the ferrule Y and the median cylinder *f* of the rod *i i'* are isolated from the remainder of the apparatus, and correspondences can continue. But, if the currents caused by the storm acquire too much intensity, the iron wire becomes melted, or at the least its isolating envelope is burnt up, in this case the upper cylinder *e* of the rod *i i'* and the ferrule X are put in communication with the median ferrule Y, the transmitted currents go to the ground through the wire T, the telegraphic apparatuses are isolated from the line, and preserved from the disastrous effects of the atmospheric currents. When the electric tension of the line is considerable, a discharge takes place between the points of the plates P Q, and the electricity goes to the ground by the wire T.

When there is a violent thunderstorm all correspondence must be abandoned, and the metallic spring of the commutator pushed on the button *d*. In this case the line currents go to the ground, and the telegraphic apparatuses do not communicate with the line, and are sheltered from any harm.

The iron wire, rolled up and around the rod *i i'* ought to be looked after with great care, and must be replaced whenever its isolating envelope is injured.

Figure 4 represents a very plain and very ingenious lightning arrester, used on the Belgian telegraphic lines. We will indicate here the disposition adopted for an intermediate office, communicating with two corresponding stations, one at the right, the other at the left. On a wooden socket are fixed three metallic plates, Q U V. At plate Q and at L the wire of one of the corresponding stations, and at F the wire of communication with one of the telegraphic apparatuses of the office. At the plate V and at L' the wire of the other corresponding stations, and at F the wire connecting the other telegraphic apparatus of the office. The ground-wire is fixed at T to plate U. A fourth metallic plate P P covers over the appendages of the plates Q V, and is isolated from it by a *very thin sheet of paper*. This plate P P is fixed by a metallic knob B which communicates with the plate U, and by its intermediary, with the ground-wire. The wooden board is perforated with four circular holes 1 2 3 4 bordered with the plates Q U V. C is a movable brass plug, which at pleasure can be put in one of these four holes.

When the plug C occupies the position indicated on the diagram, the wires L L' are directly in communication with the telegraphic apparatus of the office, and correspondence can be kept up. When a thunderstorm suddenly bursts out on one of the lines the electric tension becomes considerable, a spark flashes out across the paper put under plate P,—all the currents transmitted on this line go to the ground by the plate U and the ground-wire, the apparatus of the office being safe.

When a violent thunderstorm is threatening on the line L the plug C is to be placed in hole 2. The plate V communicates with plate U, all the currents of the line L' immediately proceed to the ground, the corresponding telegraphic apparatus are safe, and correspondence can continue on the line L.

Digitized by Google

When the storm at the same time threatens the two lines L L', the plug C is to be put in the hole 4. Then the two plates Q V communicate with U, the currents transmitted on the two lines immediately go to the ground, the apparatus are safe, but correspondence is suppressed on the two lines.

To establish direct communication between line L and line L' the plug C is to be put in hole 3. It is evident that in this case all the currents transmitted on the line L directly pass on the line L', without crossing the apparatuses of the office and reciprocally.

Mr. Bianchi proposes the following simple plan: A large metallic sphere is put in the circuit of the line. This sphere is enveloped by two glass hemispheres in a metallic circular band, itself being armed with a large metallic rod, which is to be screwed on a metallic plate, fixed against a wall. This metallic rod is hollow and shut off by a faucet, and communicates with the interior of the enveloping glass sphere. A metallic band establishes the communication of the metallic plate with the ground. At its inner face, the metallic band is armed with a great number of metallic points all directed towards the centre of the sphere and very near to its surface by their free extremities. Before fixing the apparatus on the plate, it is proper to make the vacuum in the surrounding glass sphere, but this precaution is not indispensible.

When the line is violently influenced by stormy clouds, luminous points are to be seen at the extremities of the points, wherewith the band is armed, the ground furnishes across the conductor, the plate, the band and its points, a continued flow of electricity, which neutralizes the charge of the contrary denomination on the line. When the line is too strongly electrified, sparks flash between the sphere and the points of the band, and the charge accumulated by induction on the wire flows into the ground. In both cases, the currents caused by the influence of stormy clouds cannot penetrate into the station, and the telegraphic apparatuses are kept safe from all harm.

A REMARKABLE EXPERIMENT WITH ELECTRICITY.

The body of John Barclay, who was executed at Columbus, Ohio, on November 3rd, was made the object of an experiment with a powerful electric battery, for the purpose of trying the effect of electricity as a means of restoring life. The experiment is thus described :—

Thirty-seven minutes after death the students began operations. The electrical instrument used was one of the most powerful, consisting of six cups of Bunsen's battery, attached to Ritch's induction-coil of the largest size. It was operated by Prof. Mendenhall, of Columbus, an eminent electrician, while Prof. Wormly and Profs. Holderman and Denig conducted the experiment. Two currents of electricity were used, one placed at the lower extremity of the body, and the other drawn along the arm, neck, face, and breast. The effect was wonderful; the eyes opened, the face drew up as if in pain, the mouth jerked to one side, the arm raised as if to strike, and the fist clinched. The limbs also raised, and the toes and fingers worked, and once the body almost turned to one side. The arms were next laid bare and a current of electricity introduced. The whole system seemed to respond, and the movements of the body were at times violent.

At four minutes to two o'clock the electricity was removed, and faint actions of the muscles could even then be observed. The body was afterwards left until ten minutes after three, when the electricity was again applied, and the muscles of the body still responded as before, but with less force. The breast was then opened, and a current passed into the heart, but gave no response. It was carried to the hands and feet, and all responded as before. The heart was then taken out and found as hard as muscle and full of blood, the lungs not congested, the brain very healthy and free from any congestion whatever. At eleven minutes after four o'clock electricity was again applied, and a good response was had ; at eighteen minutes after five a faint response was given ; and at fifteen minutes to six, five hours and thirty-five minutes after death, the strongest experiment that could be applied, failed to move a muscle.

CONDUCTING POWER OF DIFFERENT METALS.

Priestly, in his History of Electricity, published in 1767, gives the following interesting account of an experiment suggested by Dr. Franklin for ascertaining the conducting powers of different metals.

"In a conversation I once had with Dr. Franklin, I asked whether it was probable that there was any difference in the conducting power of different metals, and if there was, whether it was possible to ascertain that difference. Dr. Franklin suggested that I try the conducting power of different metals, by sending a large shock through wires of the same size and observing the different lengths that may be melted of the different wires. I subsequently endeavored to carry the scheme into execution by transmitting the same explosion of the battery through two wires at a time of two different metals of the same thickness. They were hooked one to the other and held fast in hand vises after they were measured with a pair of compasses to exactly the same length. The experiments were much more pleasing and satisfactory than I expected, but the result by no means corresponded to my ideas, *a priori*.

"I first joined a piece of iron wire and a piece of copper wire. The explosion totally dispersed the iron and left the copper untouched. The brass likewise disappeared when joined with the copper and the iron when joined with the brass. So far the experiments were extremely easy ; a single charge of the battery sufficing to determine the difference between any two, but when I came to compare the more perfect metals, I found much more difficulty and was obliged to try four or five charges of the battery upon every two, for their conducting powers being nearly the same, I either made the charge too high and dispersed them both, or too low and touched neither of them. At length I happened to hit upon such charges that the copper vanished and left both the silver and gold, and the gold remained when the silver was dispersed. The hook, however, of the silver was melted off when the copper was dispersed, and the hook of the gold when the silver was dispersed, for the heat is always the greatest where the electric fire passes from one body to the other. Before the dispersion both of the copper and the silver I had made explosions of such a strength as though too small to melt them, gave them a bluish tinge. From these experiments it is easy to settle the order in which the metals above mentioned are to be ranked, with respect to the power of electricity to melt them. It is as follows: iron, brass, copper, silver, gold.

"Not being able to get lead or tin drawn into wires I got pieces of those metals rolled into plates equally thin, and, taking small slips of equal length and breadth, I transmitted the explosion through them, when the lead gave way the first. I intended to have compared these plates with others of iron brass, &c., but had not an opportunity. I have little doubt that tin would melt before iron, though indeed I had expected that tin would have melted before lead, and gold before silver. But according to Mr. Wilke's experiments, lead is a worse conductor than any of the other metals. My own experiments on the circular stops made me expect that gold would have melted before silver.

"It is very remarkable that when iron wire is melted by the electric explosion, bright sparks are generally dispersed about the room in all directions ; but that they are seldom or never seen when wire of any other metal is used. If but a small residuum of a battery be taken between two iron rods when the explosion is extremely little, a great number of small sparks will fly in all directions from the iron to the distance of about an inch, and exhibit a beautiful appearance. Fewer of these sparks will be seen if one of the rods be brass, and, I think, none, in these small discharges, if they both be brass."

FORETELLING MAGNETIC AURORAS BY TERRESTRIAL ELECTRIC CURRENTS.

Magnetic auroras being periodic phenomena which appear to have an intimate connection with the movements of the solar atmosphere and with the activity of terrestrial magnetism, we may ask if it is not possible, by the observation of solar spots and protuberances and of the terrestrial currents that traverse telegraph wires, to predict the appearance of auroras, as by the descent of a barometer and perturbations of the magnetic needle the approach of squalls and cyclones is foretold.

At Palermo the advance of such a magnetic storm has been predicted by an observation of the changes the sun presented during the day. But such observations made by a skilled astronomer trained to the use of the spectroscope are exceedingly delicate, and in the present state of the science are not perfectly reliable. Not so, however, with the currents in telegraphic wires which nearly always precede magnetic storms. These might, without difficulty, be employed for the purpose in view.—*Nature and Science, in Scribner's for December.*

TELEGRAPHIC EXPERIMENT.

In a communication to the *Chemical News*, Mr. H. Highton gives the result of an interesting experiment made with his new instrument upon a broken cable. It is as follows :

"On November 4th the cable from Dover to Boulogne was broken by a ship's anchor, about five miles from Dover. By the kind permission and co-operation of Mr Bourdeaux, the engineer of the Submarine Telegraph Company, I placed my instrument (as shown lately before the Society of Arts, and described at the time in your journal) between the end of the broken cable at Dover and the water-pipes of the town. To our surprise we could distinctly read every message to and from Ostend, Calais, and Dover, on the Dover-Ostend, and Dover and Calais cables. The explanation was as follows : Part of the electrical current which went to earth at the Dover water-pipes went on to a second earth formed by the end of the broken cable, and in its passage made signals on the instrument. Thus the enormous fault formed by the Dover water pipes was not sufficient to prevent a perceptible current of electricity passing on to the broken end of the Dover and Boulogne cable.

We also asked the French operator at Boulogne to send a current through the broken cable, and got a feeble result ; but as we were not able, without special authorization from the French Government, to get him to put on such batteries and instruments at Boulogne as were necessary, and the remaining cables were fully occupied with messages, we did not follow out this portion of the experiment. The first experiment, however, shows what an enormous fault may exist without preventing the action of the delicate instrument, which I described in a former number of your journal.

I am, &c.,

H. Highton.

Putney, November 12th, 1872.

CORRESPONDENCE.

QUINCY, ILL., Dec. 4th, 1872.

To the Editor of the Journal of the Telegraph:

As you invite practical suggestions relating to economy and reform, I submit a few.

The new operating tables, with glass partition, and gas jet in the centre, used by the W. U. Company, in their large offices, are handsome in appearance, but objectionable in other respects.

The gas light being in front of the operator throws its glare, as well as the reflection from the polished table, directly into the operator's eyes, so that in some positions it is almost impossible to see the sheet upon which he may be writing. This is especially bad for those who write on the glazed manifold paper, on which "press report" is usually copied. The eyesight of the operator will inevitably be impaired sooner or latter by this manner of abusing it. The difficulty might, perhaps, be obviated by attaching a drop leaf to one end of the table, so arranged that the operator could sit with the light at his back or at one side.

The peg switch boards used by the same company are perhaps the cause of a great many "bad connections." I know of a switch board of twenty wires capacity, which has been in use about nine months, and when I saw it last, it had scarcely a nut or post on its back but what was loose, many of them would open the circuits running through them at every sudden jar on the floor. This board had been placed in position by one of the company's electricians, and was undoubtedly in good order when first put up. Changes of temperature undoubtedly affect these switches, hence the necessity of frequent attention, especially at the beginning of Summer and Winter.

J. J.

BURLINGTON, IOWA, Nov. 23rd, 1872.

To the Editor of the Journal of the Telegraph:

Please allow me to offer a few suggestions in relation to checking and counting paid business. First—Instead of "City" and "Through," why should a prefix consisting of one letter, not do as well? Say "C" for the former, and "X" for the latter.

Second—Would it not be an improvement to give the number of words in a message immediately after the prefix instead of after the signature? This would inform the receiving operator how long a message he had to "get down" on the "blank," and also to enable him to check the number of words as he wrote them. If the message was a lengthy one, he could put so many words in each line, as the lines could be easily and rapidly counted.

In England, the Telegraph Companies use what is called "Code Time," which is entered on the face of the "Sending" blank by the Receiving or Counter clerk. The operator is ruled entirely by this code time in sending messages, priority being his guide, and there is no deviation from this rule. Any operator who is guilty of sending a message out of its proper "turn," is severely dealt with. In addition to this, the code time is valuable to the receiving office, as it shows exactly at what hour and minute the message was handed in at the sending office. Sometimes this information is of great benefit and importance to the receiver of a message. I inclose an imperfect sketch of this "code," showing letters for different hours and minutes. It is very simple, costs nothing, and might be of some advantage to the service.

B.

To the Editor of the Journal of the Telegraph:

Permit me in your columns to say a few words about the feminine members of the profession, their peculiar disadvantages and disabilities, hoping thereby to secure even a larger share of leniency and a still firmer grasp of the brotherly helping hand, which, as far as the writer can testify, has always been kindly and freely tendered.

To excel in the art of telegraphing requires speaking phrenologically—memory, continuity, individuality, language—largely developed, with accuracy and firmness, quickness and self-poise, the last being one of the most necessary qualifications, for the faculties should be under perfect command, kept in the hand as it were, ready to do service when needed, with unfailing certainty.

Consequently the operators, as a class, are slender, nervous, quick, bright-eyed, and sharp-featured. The ponderous, slow but sure mover and thinker, although one of the weights wherewith the world is balanced would be in a telegraph office like an "elephant in a China shop"—the saying is an old one, but I never heard that elephants had any predilictions for the China business, neither do the abovementioned type of men usually care to bring their huge propelling powers to the delicate perceptive management of the mysterious little electrical key.

On the contrary, woman being man repeated in a weaker but finer and more sensitive mould, when her supernervousness is well controlled, ought to be peculiarly adapted to this profession; but is her success above mediocrity? I think not. "She does very well, indeed; surprisingly well for a lady" is a remark too often heard, and all the more hurtful, because perhaps, in the aggregate, deserved. The reason why upon entering the arena of business life, she so often fails to reach excellence, is not inherent incapacity, but bad mental training. No one who has had that wide-awake, wit-sharpening, lookout for number one educating process which our American boy necessarily passes through in his gradual develvelopment to manhood, can have any idea of the disadvantage with which a young girl, her whole previous experience carefully shielded from responsibility, when compelled to do so by a reverse of fortune, takes her place in the ranks of busy workers and begins the hand to hand battle for dollars and cents. And here is the key to all the trouble; it is seldom, except when driven to it by misfortune, a girl of culture does or expects to work for her living, and this is why she is so poorly prepared for the emergency when it comes; but her task is easy compared with the untold obstacles in the way of a woman of mature years when placed in the same position; unaccustomed since school days to mental exertion unless in the mood, and to many the mood never comes, having accomplished the daily duties of life, because never paid for her labor, in a hit or or miss manner, "if it turns out right well, if not nobodies business," enervated from poor inertia, old and worn out for want of healthy, regular employment, and the sense of usefulness which is the life of living; she comes to her work, weak and flaccid, mentally and physically, unable to meet the required duties, and there is nothing left but to patiently and laboriously begin again and build herself up anew.

This is the present condition of a number of women and girls preparing for and taking their places in Western Union offices. Many there are, I am proud to say, healthy and trained in body and mind; an honor to their sex and profession; these are amply to care for themselves. To the others, perhaps, a few hints may be of service from one who through her own imperfections feels the necessity for improvement.

In a future paper I may say something about training the mind to quickness and accuracy.

A.

Ought a forwarded message be pasted to a No. 2 blank?

Answer—If the message originated upon the Western Union lines it is not necessary to attach it to a No. 2 blank for re-transmission, but if it was received by some other line and handed into our office for transmission, it should be attached to a No. 2 blank, in accordance with the requirements of Rule 2.

Ought any remark after a DH check go over the wire, whether it be "opr," "pass," or on any other account?

Answer—No remark of any kind should be transmitted in explanation of the checks. The sending office is responsible to the company for all messages sent, and the receiving office is only required to know that a message is paid, collect, or free. It is, of course, unnecessary to add "it is an answer" to collect checks.

In attaching a red blank No. 45 to a No. 2 blank, to have it go at full rate, ought not the printed red instructions be torn off?

Answer—Yes.

Should not receiving clerks put checks on half-rate messages in the same way that they are to be sent over the wires?

Answer—The receiving clerk should, in all cases, state the number of words and amount paid or collectible upon all full or half rate messages, but the operator, in the transmission of red messages, will simply say paid, or collect, half rate.

A message is sent from a railroad office to an out side party, and asks for answer, the message was sent D.H., R.R.S.

Now, the answer comes back into Western Union Office, *collect*, and the railroad agent refuses to pay charges, saying it should be DH., R.R.S.

Should I make last message *uncollectible*, or instruct sending office to make it D.H. or what?

Answer.—Your only course is to return the message as uncollectible, with a full statement of the reasons. If the sending office had a right to send the message free in the first instances, the answer would properly come back free, but if the original message was not entitled to free transmission, the office from which it was sent would be responsible for the tolls.

W. T. S., Larned, Kan.—You are wrong; there are but sixty-two words in the message. The rule is that when amounts or numbers are duplicated in figures, the figures shall be counted as containing the same number of words as the amounts which they represent are written out, it making no difference whether the figures are written before or after the words which represent them. For instance, "twenty thousand (20,00)" when written out and duplicated in figures, are counted four words.

H. T. B.—We cannot inform you where a map of the telegraph lines of the United States and its territories can be obtained. It is doubtful whether such a map exists.

G. E. S.—The Journal of the Society of Telegraph Engineers, is published by that society at London. It is not issued regularly; but one number has as yet appeared, that dated May, 1872.

FOREIGN TELEGRAPHIC ITEMS

THE TELEGRAPH IN BRAZIL.

By decree of 30th October, Art. 10th of the decree of August 16th last, authorizing Baron de Maua to lay a transatlantic cable, has been superceded by the following:

"At the end of the twenty years of exclusive privilege the concessionary will have the enjoyment of the cable or cables he may have laid, but without any privilege."

This removes the ambiguity which existed in the superceded clause.

The southern telegraphic line has been opened to Jauguarao, which is on the frontier with the Oriental republic. The lines of the Platino-Brazileira Company were commenced at Montevideo on 20th of October, so that much time will not elapse before the La Plata and Brazilian telegraphic systems will be connected.

At Bahia work was begun on the 7th of October on the telegraph to the north, to join the Pernambuco one in the provinces of Sergipe, at Aracaju. The distance is 396 kilometres.—*Anglo-Brazilian Times.*

The concession for laying and working the submarine telegraph between Odessa and Constantinople has been granted by the Russian Government to the Danish engineer, Herr Tietgen, whose project has been handed by the Minister of the Interior to the Supreme Council of the Empire for approval and confirmation.

The French Atlantic Telegraph Company have decided upon raising the balance of the money required for their new cable by the issue of £400,000 six per cent. debentures, redeemable within fifteen years at par, to be allotted *pro rata* to their shareholders at the price 95 per £100, the instalments to be spread over six months. Powers are taken to pay off the bonds at any time by giving three months' notice, in view of the arrangements for amalgamation.

It is stated that a company is now in the course of formation to lay a submarine telegraph from Rangoon to Singapore, touching at the Andaman Islands, Penang and Malacca. The tariff for messages from India to Singapore by the new line will be 24s., against the present rate of £2 14s. Arrangements have been made to carry "through" messages between London and Singapore for £3 10s. instead of £5 10s., and a corresponding reduction will take place in the tariff to China, Java and Australia.

The postal administration of the Imperial German Government is about to establish at Berlin a system of pneumatic tubes for the transmission of letters and parcels from the central to the district post-offices throughout the city, and to the railway stations. This is an extension of the system now in use for the transmission of telegraph despatches.

The Madrid *Gazette* publishes a decree approving the cession by Messrs. Aspinwall to the Anglo-Spanish Telegraph Company (limited) of the concession granted by the Spanish Government for the submarine cable between England and Irun.

A proposal by Clarke & Co. to construct a cable between Chili and Peru has been referred to the Chilian Congress.

A contract has been made with the Government of Guatemala for constructing telegraph lines so as to place the capital in communication with Salvador, the principal towns in the interior of Guatemala, and the two seaports of San Jose and Champerico.

The *Adelaide Observer* of July 20, 1872, gives the following details of the telegraphic route from Falmouth to Port Augusta:

	Miles.
Falmouth to Gibraltar, via Lisbon cable	1,250
Gibraltar to Malta (cable)	981
Malta to Alexandria (cable)	819
Alexandria to Suez (overland line)	224
Suez to Aden (cable)	1,308
Aden to Bombay	1,664
Bombay to Madras (overland)	600
Madras to Penang (cable)	1,213
Penang to Singapore (cable)	301
Singapore to Batavia (cable)	560
Batavia to Bangoewangi (wire)	480
Bangoewangi to Port Darwin (cable)	970
Port Darwin to Port Augusta (wire)	1,800
Port Augusta to Adelaide	21
Total	12,382
Lisbon to Falmouth	268
Total	12,650

Post Office Telegraphs.—Statement showing the total number of messages forwarded from Postal Telegraph Stations in the United Kingdom during the week ending the 23d of November, 1872, and during the corresponding week of 1871: Week ending November 23d, 1872, total number of messages, 302,664; week ending November 25th, 1871, total number of messages, 241,465; increase in the week of 1872 on that of 1871, 61,199.

Postal Telegraphs.—The official return, made in pursuance of the Act of Parliament, shows that the gross amount received in 1871 by the Telegraph Department was £1,133,575, from which must be deducted £401,210 for the amount paid to submarine telegraph companies, being message receipts collected on their behalf, and the amount allowed to postmasters in respect of sums paid by them for the special delivery of messages, &c. This reduces the year's receipts proper to £732,365. Sums amounting to £487,544 were expended in the year in respect of salaries, rent, maintenance of telegraphs, &c. This left a balance of £244,821 applicable to the payment of annuities of interest falling due upon the securities issued under the authority of the Telegraph Act of 1869, and as a sinking fund for the redemption of such securities.

At a general meeting of the China Submarine Telegraph Company (Limited), held recently, a question was put to the chairman as to the amalgamation of the British Indian Extension, China Submarine, and Australian Telegraph Companies. The Chairman, in reply, intimated that negotiations were in progress for the purpose of amalgamating these companies, the result of which will be the duplication and extension, where necessary, of the different lines comprising the system.

Now that the telegraph on the railway from Christiana to Stockholm is completed, there is a direct telegraphic communication between the two sister kingdoms of Sweden and Norway. The arrangement has been made that, of the three wires from Christiana to the Swedish frontier, one of them carries messages to Stockholm, the second to Gothenborg, and the third to Malmo.

Advices from Valparaiso of Nov. 16th state that a bill has passed the Senate of Chili authorizing the establishment of a new line of telegraph from Caldera to Loto, connecting with the intermediate ports.

"PUCK'S" TIME BEATEN.—WONDERFUL TRAVELS OF A TELEGRAPHIC DISPATCH FROM AUSTRALIA.

A few days since the *Chronicle* published congratulatory telegrams which passed between the Mayor of Adelaide, in Southern Australia, and the Mayor of San Francisco. The telegrams referred to had to pass over 16,000 miles to reach their destinations, and as this is the first telegraphic message that ever was sent so far, we give the route over which it came as an item that may prove of interest to the readers of the *Chronicle*. It came across the Australia continent, under the Indian Ocean, through the Sunda Islands to Hindostan, under the Arabian Sea, through the Red Sea, over the Isthmus of Suez, under the Mediterranean, over Western Europe to London, under the Atlantic Ocean to New York city, and overland to San Francisco. It was received and published in San Francisco on the same day that it was dated, the science set nature's laws at defiance. If the forwarding machinery were perfect and expeditious in its workings, such a telegram ought to reach the Pacific coast within a few moments after its departure from Australia, which would be, by our solar time, nearly fifteen hours before it was sent! As, if it was despatched at 6 o'clock in the morning from Melbourne, it would reach San Francisco at 3 o'clock in the afternoon of our previous day.—*San Francisco Chronicle.*

DEVICE FOR SIGNALING BETWEEN TRAINS.

Mr. R. K. Boyle, of Brooklyn, N. Y., is the inventor of a system of signaling, by electricity, between trains or locomotives on the same track, to prevent collisions, alike by trains meeting when traveling in opposite directions as by one train overtaking another, and serviceable especially in going round curves or through tunnels, and at night or in foggy weather. It consists of an arrangement whereby the circuit is formed by or through the trains on the same track, the rails of said track, and a third or ordinary rail of an adjacent track or additional rail of the first mentioned track, without insulating any of the rails; also in a circuit closer, carried by each train, and adjustible by the engineer, relatively to one of the rails, to open and close the circuit. This part of the invention likewise embraces a peculiar manner of hanging and operating the circuit-closer, whereby, when adjusted to break the circuit, it is both raised and drawn inwards towards the side of the train, so as to be out of the way. A wire brush, forming part of the circuit-closer, is used to establish contact with the rail.

TELEGRAPHIC IMPROVEMENTS AND EXTENSIONS BY THE WESTERN UNION TELEGRAPH COMPANY ON THE PACIFIC COAST.

The Western Union Co. are making large improvements and extensions in Oregon. A new cable has just been laid between San Juan and Lopez Islands, renewing connection between Victoria and the main land. Their wires have also been extended from Seattle to Port Townsend *via* Port Blakely, Port Madison and Port Gamble. A two wire line has been completed along the N. Pac. R., and double lines along the Or. & Cal. R. as far as completed.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
January 1, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular.

GENERAL INFORMATION.

Wetumpka, Ala., re-opened. (Former notice is disregarded by several offices.)
Brooklyn, Cal., closed.
Markleeville, Cal., closed.
Woodford, Cal., closed.
Big Coolie, Dac., closed.
Little Coolie, Dac., closed.
Snake River, Idaho, re-opened.
Stoner Station, Idaho, closed.
Rock Island Junction, Cook Co., Ill. P. O. A. is Englewood, Cook Co., Ill.
Mill Shoals, Ill., closed.
Rome, Jones Co., Iowa, changed to Olin, Iowa.
Martello, Iowa, should read Martelle, Iowa.
Terry's Station, Mich., closed.
Mackinaw City, Mich., closed.
Dallas, Minn., closed.
Etter, Minn., closed.
Kearney Junction, Neb., is now a W. Union office, sq. 522.
Spencer Springs, N. Y., closed.
Woodstock, N. Y., closed.
East Liberty, Pa., P. O. A. is "Station A," Pittsburgh, Pa.
Henderson Farm, Pa., changed to New London, Pa.
Lehigh Summit, Pa., closed.
Southampton, Pa., changed to Glencoe, Pa.
Olcopolis, Pa., is another line office; erase the square number.
Messages for Fishbach, Pa., may be taken and sent to Pottsville, Pa., from which office they will be delivered. Charges for delivery, ten cents.
Berkshire, Vt., should read 30 2 30 Stanstead, Que., Mont. Co.
Island Pond, Vt., should read 30 2 30 Stanstead, Que., Mont. Co.

The additional word rate for offices on other lines in W. T., published in last JOURNAL, is for five words or less.

Port Blakly, W. T., should read Port Blankly, W. T.
Worthington, Wis. No office at this point.
Bitter Creek, Wy., is now an other line office; tariff for other lines, 70 5. 564 Rawlins, N. Y.
Medicine Bow, Wy., is now an other line office; tariff for other lines, 65 4. 556 Laramie City, Wy.

NEW OFFICES.

*Cherokee Flat, Cal., 25 *10 Oroville, Cal., ck. San Francisco.
808 Rossville, Ill.
367 Centre Junction, Iowa
367 Olin, Iowa.
367 Paralta, Iowa.
367 Tipton, Iowa.
367 Virogwa, Iowa.

191 Millersburg, Holmes Co., O.
58 Gouldsboro, Luzerne Co., Pa.
122 Glencoe, Pa.
76 Hummelstown, Pa.
130 New London, Pa.
292 Brentwood, Tenn.
321 Pinson, Tenn.
311 Stewart's Station, Tenn.
470 Overton, Texas.
* Alderson, W. Va., { 65 4 203 Huntington, W. Va. / 50 3 133 Greenbrier, White Sulphur Springs, W. Va.

* Each additional five words or less.

OFFICES HAVING "SPECIAL SHEET A."

Tariff to Hummelstown, Pa., will be 25 cents more than Harrisburg, Pa., or 35 cents more than Philadelphia, Pa., whichever gives cheaper rate. If the rate to square 76 is less than the added rates, use the square rate.

WILLIAM ORTON, President.

WESTERN UNION TELEGRAPH COMPANY,
NEW YORK, December 30, 1872.

Executive Order, No. 142.

All Business and Complimentary Franks issued by this Company for the year 1872, are hereby continued in force until the 31st day of January, 1873.

GEO. H. MUMFORD,
Vice-President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, Dec. 26th, 1872.

To all Transfer Agents:

Mr. J. B. Tree has removed his head-quarters from Jackson, Tenn., to Louisville, Ky.

G. H. MUMFORD, Vice-President.

EXECUTIVE OFFICE, New York, January 20, 1873.

From and after this date, all money order offices in G. W. Trabue's district will be transferred to J. B. Tree's district, and all money order offices in Jas. Compton's district will be transferred to D. Flanery's district.

G. H. MUMFORD, Vice-Pres't.

SALE OF STOCK OF THE NEW YORK, NEWFOUNDLAND AND LONDON TELEGRAPH COMPANY.

Negotiations, which have been in progress for some time past for the purchase of most of the stock of the New York, Newfoundland and London Telegraph Company, have been completed. The stock is purchased by a combination of English capitalists at 90, and the proprietorship of the company is now mostly in English hands. The organization of the company will, for the present, at least, remain intact—the management, of course, being transferred to the purchasers. The issued capital of the company is $4,300,000, and it is understood to be intended to have it placed upon the list and quoted at the London Stock Exchange.

The following will be the Board of Directors under the new organization: Sir James Anderson, Julius Beer, E. L. S. Benzon, Cyrus W. Field, Henry Weaver. Mr. Weaver will be the managing director.

Messrs. J. S. Morgan and Company announce that they are authorized to receive subscriptions for 33,500 shares of £20 each, being part of the issued capital of the New York, Newfoundland, and London Telegraph Company, an undertaking working with the Anglo-American and French Atlantic Telegraph Company. The authorized capital of the Company is £1,200,000, and the issued capital £863,520. The Company has exclusive working agreements with the Anglo-American, French Atlantic and Western Union Telegraph Companies for fifty years, from January, 1870, determinable by the Anglo-American or French Atlantic Telegraph Company in 1905, upon five years' previous notice. Under these agreements the cable receipts belonging to the companies form a joint purse, of which, until the completion of a new cable which the French Atlantic Company is about to submerge, the Anglo-American and Newfoundland Companies receive together 63½ per cent., while the French Atlantic Company takes 36½ per cent. After the completion of this new cable, the latter undertaking will be apportioned 48 per cent., and the two former 52 per cent. The Newfoundland Telegraph Company possesses 1,531 miles of land lines, and 696 miles of cables connecting the American cables with all the principal telegraph wires of the United States.—*The Financial Chronicle.*

MR. W. D. SCHRAM, formerly of the No. 21 Wall street office, has been transferred to the General Office, 145 Broadway, and placed in charge of the Receiving and Delivery Departments.

SUCCESSFUL EXPERIMENTS WITH THE STEARNS' DUPLEX. WORKING A 2000 MILE CIRCUIT. NEW WIRE.

SOME interesting experiments have recently been made on the Western Union lines to determine the practicability of working the Stearns duplex instruments direct through long distances. On Thursday, December 12th, a circuit was made up from Plaister Cove to Chicago, a distance of about 2,000 miles, with duplex repeaters at Bangor, New York and Buffalo. The result of this trial was very satisfactory, On Tuesday, the 17th inst., another circuit was made up from New York to Buffalo *via* Hornellsville and back, thence to S. Johns, N. B., and back to Boston—about the same length as the previous one, with repeaters at Buffalo, New York and St. John's, The "specials" to Boston were then sent through the entire distance and excellent time made. The experiments were in all respects an unqualified success.

A new wire, No. 6 gauge, has been completed between this city and Cincinnati, upon which the duplex system is worked very satisfactorily. Only one repeater is found to be necessary upon this circuit.

BORN.

WOODARD.—At Waterford, Pa., December 15, 1872, to Anson H. Woodard, Manager W. U. Tel. office, a son.

MARRIED.

BETTS—WILCOX.—At Corunna, Mich., November 21, 1872, at the residence of the bride's parents, Mr. Fred. Betts, Manager W. U. Tel. office, Owosso, Mich., to Miss Ella Wilcox, of Corunna.

COY—POTTER.—At Hamilton, O., December 10, 1872, by Rev D. J. Storr, W. H. Coy, Manager W. U. Tel. office, to Miss Vickie Potter, daughter of Dr. S. H. Potter, all of Hamilton.

FOSTER—CALLENDAR.—At North Lewisburg, O., December 10, 1872, by Rev. B. Seever, C. H. Foster, Supt. Telegraph, I. B. and W. Ry., to Miss Cora Callendar.

HARDWIDGE—DAVY.—At Manafield, O., December 1, 1872, by Rev. S. A. Bronson, Mr. Charley Hardwidge to Miss Lizzie Davy, formerly Manager W. U. Tel. office, Sewickley, Pa.

HOWARD—OGILVIE.—At the residence of the bride's parents, near Paducah, Ky., December 10, 1872, John W. Howard, operator W. U. Tel., Blandville, Ky., to Miss Laura M., daughter of Hon. John W. Ogilvie.

HUNGERFORD—WELCH.—At the residence of the bride's parents, Danville, N. Y., November 21, 1872, by Rev. D. Lisenring, V. R. Hungerford, Manager W. U. Tel. office, to Miss Mary E. Welch, of Dansville.

LOGAN—COBB.—At Pensacola, Fla., November 27, 1872, at the residence of the bride's father, by Rev. W. C. Carter, Mr. Wm. T. Logan, of Georgia, Manager Pensacola Tel. office, to Miss Annie R. Cobb, of South Boston, Mass.

RIDDICK—HAMILTON.—At the Methodist Church, Marion, Ala. December 15, 1872, by Rev. J. Bancroft, J. H. Riddick, Manager W. U. Tel. office, Marion, to Miss Viola Hamilton, of Perry.

RIDDLE—HALSEY.—At the Parsonage, Mariner's Harbor, Staten Island, October 23, 1872, by Rev. Mr. Taylor, Mr. S. D. Riddle, Manager W. U. Tel. office, Occidental Hotel, New York City, to Miss Virginia F., daughter of Capt. W. J. Halsey.

SHINDEL—HUMMEL.—December 25, 1872, by Rev. M. S. Shindel, assisted by Rev. James Curns, R. H. Shindel, Manager W. U. Tel. office, to Miss Mary Hummel, both of Selins. Grove, Pa.

WAMBLE—ANDERSON.—At the residence of the bride's father, December 3 1872, by Rev. J. Bancroft, A. M. Wamble, Manager W. U. Tel. office, Marion Junction, Ala., to Miss Hattie Anderson, of Marion.

DIED.

YMOND.—In New London, Connecticut, December 1, 1872, Reuben S. Raymond, Manager W. U. Tel. office, aged 42 years.

THE TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

ORGANIZED IN 1867.

The heirs of deceased members receive one dollar from each of the surviving members of the Association.

All engaged in the Telegraphic service are eligible to membership, if in good health and of good character and habits. Initiation fee, $1.50.

Blank forms of Application and Restoration may be had of the Secretary, or of any of the following Agents:—

Augusta, Ga., ...J. M. Crowley.
Baltimore, Md., ...Archd. Wilson.
Buffalo, N. Y., ...J. W. Tillinghast.
Cincinatti, O., ...F. A. Armstrong.
Chicago, Ill., ...W. C. Long.
Cleveland, O., ...H. L. Melton.
Clinton, Ia., ...E. O. Wait.
Erie, Pa., ...G. W. Baxter.
Harrisburg, Pa., ...H. A. Clute.
Indianopolis, Ind., ...D. C. Hinsdale
Mobile, Ala., ...Wm. Sandford.
Memphis, Tenn., ...J. J. Fowler.
Milwaukee, Wis., ...D. H. Henshaw.
New Orleans, La., ...Jas. T. Alleyn.
Nashville, Tenn., ...E. C. Boyle.
Philadelphia .....Jas. Merrihew.
Phillipsburg, N. J., ...John Fuller.
Pittsburg, Pa., ...S. L. Gilson.
Richmond, Va., ...R. M. J. Paynter.
Syracuse, N. Y., ...D. L. Pike.
St. Louis, Mo., ...J. P. Cassidy.
San Francisco, ...J. S. Urquhart.
Seattle, Wash. Ter., ...F. H. Lamb.
Toronto, Ont., ...A. Hunter.*
Washington, D. C., ...M. Marean.
White River Junc., Vt., G. W. Gates.

Additional Agents will be appointed as soon as practicable.

Applications for membership should be endorsed by the Agent through whom they are made.

Members in communicating with the Secretary will always state the Number of their Certificate.

A. S. BROWN, Treas.
D. R. DOWNER, Secy.

* A. Hunter is Agent for all of Canada.

TELEGRAPHERS' INSURANCE ASSOCIATION.

The acknowledgment of receipt on any assessment is to be understood as an acknowledgment for all previous assessments.

NOS. 34, 35, & 36.

No. 34.—447 1187 1628

No. 35—931 1001 813

Notwithstanding the triple assessment we were compelled to issue, members have been very prompt in remitting. About 800 have so far sent in their three dollars each to the Secretary, and there is sufficient in the hands of agents to warrant us in stating that the delinquent list will be smaller than ever before.

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

Members to whom the following certificates have been issued are in arrears. Notices by mail have been sent to each of them, and to those in arrears on assessments, up to No. 32, a blank form of restoration has been sent, which must be properly filled out and endorsed by an agent, if restoration to membership is desired.

ASSESSMENTS DUE.

INGENIOUS AND NOVEL METHOD OF ARRANGING ELECTROPOION BATTERIES.

A San Francisco correspondent communicates the following:

"An Electropoion battery of five cells was recently shipped to a repair station in the third district of this division, to be used for testing purposes. Shortly afterwards the station was visited by the District Superintendent, who reports to this effect:"

"When I reached . . . I found his main battery in circuit and working nicely (?) He had no practical knowledge of batteries, and had received no instructions, but his ingenuity was equal to the emergency. He placed the jars, zinc and porous cells in proper position, then packed dry crystals of bi-chromate of potash around the zincs, and partially filled the tumblers with water, placed some mercury in each porous cup, and immersed therein the platinum button connectors; the free ends of which he connected to the zinc arms, thus entirely dispensing with the carbon plates. Everything being 'set' as described, he filled up the porous cups and tumblers with sulphuric acid, until every cell 'boiled.' The battery was then switched into circuit, and our rural electrician rested from his labors, with the happy consciousness of a duty well performed."

AMERICAN genius stands preëminent in the perfection of mechanical appliances to supersede manual work. Perfect invention to this end is, indeed, the offspring of necessity in the United States, where scarcity of hand labor has forced forward, to an almost inconceivable degree, human ingenuity In this special branch of invention, there can be no dispute that the Yankee can give the world long odds and beat him. In England, where labor has been always abundant, and until of late, cheap, the genius of invention has trodden rather the higher than the humbler path of life, has tended rather to achieve great ends than to effect simple purposes, has given mechanical handicraft less attention and devoted itself to great physical revolutions. In America, it is far different; there is scarcely an industry too humble, a labor too mechanical or common to escape the attention of the inventor, who, with an almost infinite ingenuity, sets himself to work to conbine all the known mechanical movements and to invent new ones, until the sleight of the hand of the operator is imitated to the life, and the dead metal is endued with life and power with which flesh and blood cannot compete.—*Engineering.*

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, JANUARY 1, 1873.

POSTMASTER-GENERAL'S REPORT.

In our last issue we reviewed, at some length, that portion of the Postmaster-General's Report relating to the telegraph, our criticisms being more particularly directed to the erroneous statements contained therein. It has been our aim to discuss the questions involved in the governmental acquisition of the telegraph in a fair and candid spirit, and with such intelligence as the long experience and familiarity with the business of telegraphing, enables us to employ. We have not imputed to the Postmaster-General any improper motives in the presentation to Congress of his singularly inaccurate and indefensible statements relating to the telegraph. The subject is too vast and complicated to be understood by a merely superficial examination, such as a Cabinet Officer, burdened with the cares and responsibilities of an important department, is able to devote to it. A business involving the employment of a capital of over sixty millions of dollars, of ten thousand skilled laborers, of six thousand separate places where it is transacted, and an annual expenditure of over seven millions of dollars, cannot be comprehended or grasped in all its details, except by a long and careful study of the subject by persons qualified by study and experience, for the office. The mere fact that the Postmaster-General estimates the value of such a business at less than one-sixth of the capital represented in it—a capital which, for the most part, has a market value of over 80 per cent. of its par value—shows, not only that his estimate of its value is not shared by that portion of the public who have money to invest, but clearly indicates that he has not given the subject the careful and intelligent consideration to which it is due. Regarding the cost of the lines, the Postmaster-General says:

"The majority of lines in this country have been built very cheaply. Their entire cost, including patents, being probably much less than $10,000,000. *In fact, the poles have been erected in many cases entirely without cost to the telegraph companies, by the railroads along whose tracks they are built.*"

Suppose the railroad companies had not only "erected" the poles, but furnished them, as well as the wires thereon, how would this fact affect the question of cost? In other words, what bearing has the question of who pays for a thing upon the cost of production?

A most striking commentary on the above statement of cost is presented in the Postmaster-General's Report in the only estimate for constructing a similar extent of lines furnished by him, *which gives the cost at eighteen and a quarter millions of dollars, providing the wire is imported free of duty.* When it is considered that wire is one of the principal items of cost, and that the duties on it amount to sixty-eight per cent., it will be perceived that the Postmaster-General's statement of cost is more than doubled by the only authority he brings forward to establish it. Supposing, however, that it could be shown that the cost of building a system of telegraphs, equal to those now in operation in the United States would not exceed twenty-five or thirty millions of dollars, would this fact prove that the Government could acquire them, or would have a right to acquire them at that sum?

Section 8 of the Act of Congress, Approved July 24, 1866, upon which the Postmaster-General relies for obtaining possession of the telegraphs now in operation in this country, provides as follows:

"That the United States may, at any time after the expiration of five years from the date of the passage of this Act, for postal, military or other purposes, purchase all the telegraph lines, property and effects of any or all of said companies, at an *appraised value*, to be ascertained by five competent, disinterested persons, two of whom shall be selected by the Postmaster-General of the United States, two by the company interested, and one by the four so previously selected."

Now, what is the meaning of the word *value* as applied to the telegraph? Does it mean the cost merely of the poles, wire, machinery, patents and other property, or does it include also its business, good-will, ability to earn money, etc.? The Postmaster-General assumes that it means simply the former, and says:

"It may be proper to state that one of the companies has advanced the theory that the Government should purchase, not only its telegraph lines, property and effects, but also the good-will of its business, based on present and prospective profits. As it is difficult to see how mere good-will can be brought before the appraisers, under the law, as it stands, it is, perhaps, unnecessary for me to discuss at much length, the merits of this claim."

If the Postmaster-General's definition of value, namely, that it is synonymous with cost, is correct, we are sadly in need of a new dictionary, for all of those hitherto published give an entirely different meaning to the word. Webster's definition of value is as follows:

"*The property or properties of a thing which render it useful; or the degree of such property or properties; worth; utility; importance; rate or estimated worth; price deemed or accepted as equivalent to the utility of anything; amount obtained in exchange for a thing.*"

It will be perceived that Webster, in no instance, makes the *value* of a thing depend upon its *cost*, and we must confess our surprise that a gentleman of Mr. Creswell's well-known ability could fall into so conspicuous an error. To illustrate the absolute dissimilarity of the two words, and the entire absence of any necessary relation between them, let us consider the *cost* and *value* of an important invention. Take, for example, Stearns' Duplex Telegraph, the cost of which to the inventor was inconsiderable, but which is already earning the Western Union Company the interest on a million dollars per annum, and the value of which is almost inestimable. Or, on the other hand, take the Morse patent, whose cost to the company was very great, but which, having expired, is now without any value whatever.

It seems scarcely necessary to further discuss the question of the dissimilarity between the cost and value of a thing, as it must be apparent to every reflective mind, but we will produce one more practical illustration, on account of its direct bearing upon the case in point.

Mr. Frank Ives Scudamore, the Director-General of the Post Office Telegraphs in England, in his testimony before the select committee on the Electric Telegraphs bill, says: "The sum that is charged by the companies for the construction of works generally includes a very large expenditure from first to last in getting up their plant of all kinds; it includes the cost of their leasehold property, and it includes the cost of their patents, which is very considerable in each year, and it also includes the preliminary expenses in getting bills before Parliament; it includes expense of every kind; it is not simply the manufacture of the mere posts and wires."

Question by Mr. GOSCHEN: "Would you be able to put in a statement and analyze the two and a half millions of the companies? You are going to buy the assets of the companies, and some of those assets represent property, that is to say, posts and wires and instruments; assets which exist at this moment; another portion of it represents no value present at all; that is to say, a certain amount which has been spent on Parliamentary proceedings, patents which have expired, and so forth. Would you be able to show what amount is to be placed in each of those to two classes?

Answer by Mr. SCUDAMORE:

"I should be very glad, indeed, if you would not ask me to put in any statement of my views as to the *value* of their property."

Question by Mr. GOSHEN:

"I do not mean the *value;* I mean the *cost.* The capital accounts of the various companies will show what they have done with their capital, and it would enable the committee to see what the public are actually buying?"

Answer by Mr. SCUDAMORE;

"I am quite sure of that; *it would enable the Committee to see what they would buy as far as the expenditure of the companies is concerned; but that is not the only sum involved in buying the trade of a company. For instance, if I may take a very low case as an illustration, if you buy a public-house you buy something more than the building, and the pots and barrels and beer engines; you buy the trade which the man has acquired.*"*

The above quotation from Mr. Scudamores testimony shows the view which the British Government took of their obligations to the telegraph companies whose property they proposed to acquire, and which they did acquire by paying for it a sum equal to twenty years' profit. Mr. Creswell says, in his recent report that the profit of the Telegraph Companies in the United States for 1872, was $3,500,000, and if the statement is correct the lines are worth, on the basis of the purchase of the English lines, $70,000,000.

But, says Mr. Creswell, "the manner in which the British government recently acquired the telegraphs cannot be cited as a precedent for the United States. There was no such previous agreement between Her Majesty's government and the companies of the United Kingdom as is contained in our Act of 1866."

* *Special Report from the Select Committee on the Electric Telegraphs Bill; together with the minutes of evidence taken before them. Ordered by the House of Commons to be printed, 16th July, 1868. Page, 152.*

Digitized by Google

The above sentence is a most remarkable one emanating as it does, from a high officer of the government, and taken in connection with the depreciatory manner in which the telegraph property of the country is alluded to. Let us analyze it and see what it actually means. It is not pretended that the British government paid too much for the property which they purchased, and which was seven times as much as Mr. Creswell estimates a similar property to be worth here, but simply that there was no such agreement between the British government and the telegraph companies as exists by virtue of the acceptance by the companies in the United States of the Act of 1866. Are we to infer by this that, if the British government had possessed such a right as the Act of 1866 gives to our government, it would have paid the telegraph companies less than their property is worth? Or are we to infer that our government is less fair in its dealings with its own citizens than the British government is with its subjects? Either the one conclusion or the other must inevitably be drawn from the premises laid down. We are unwilling however to believe that our government is disposed to treat its citizens in so unfair a manner, or that Mr. Creswell would knowingly recommend it. On the contrary, we incline to believe that this view of the case was conceived by some assistant of the Postmaster-General, whose desire to acquire the property for the department at a cheap rate, overcame his discretion or notions of equity.

But admitting, for the purpose of illustration, the improbable hypothesis that our Government is capable of taking advantage of a legal right to force a portion of its own citizens to sacrifice a large and important property, regardless of all questions of justice or equity involved in the case, we deny that the United States has acquired any such right over the property of the telegraph companies which accepted the conditions prescribed in the Act of July 24th, 1866. This Act, so far as it relates to the acquisition of the property, simply provides that the United States may purchase it at an appraised *value*, to be ascertained by five competent disinterested persons.

Now, according to Webster's definition of value, the value of the telegraphs cannot be less than the market price, because that can always be "obtained in exchange for them;" nor can it be less than "the price deemed equivalent to their worth, utility, importance or usefulness;" and the British Government, the only Government which has ever purchased an extensive telegraph system, wholly constructed by private enterprise, has already established the precedent that the value of the lines and property of a telegraph company is equal to the sum of twenty years' net profits, which would make the value of the telegraphs in the United States at least $70,000,000. This sum, however, is but the commencement of the amount which the Government will be obliged to expend in the event of its going into the business of telegraphing.

If the Postmaster General's estimate of the increase in the telegraphic correspondence of the country, under the proposed average reduction of the tariff to 33⅓ cents per message, is correct, and the number of messages annually transmitted is increased from 15,000,000 to 30,000,000, the satisfactory performance of this increased traffic will require a proportionate increase in facilities, and, while these, in a great measure, may be supplied by the introduction of the duplex apparatus, there would still exist the necessity for the expenditure of a vast sum of money in the construction of additional lines.

The transmission of telegrams is totally unlike the transmission of letters; an increase in the number of letters is easily and readily provided for by the purchase or manufacture of a few extra bags, but the increase in the number of messages, transmitted over the wires, can only be provided for by proportionately increasing the number of circuits and operators required for their transmission.

PERMANENT ENLARGEMENT OF THE JOURNAL. HOW TO INCREASE ITS CIRCULATION.

A COMMUNICATION from a very intelligent correspondent, which appeared in our last issue, suggests a plan whereby the circulation of the JOURNAL would be greatly increased. While we fail to appreciate the force of the ideas given, we can fully understand the benefit which would arise to the recipients of the paper upon the terms suggested.

The knowledge we have of our correspondent enables us to feel assured of his earnestness, and of his belief that if every employé was furnished regularly with each issue of the JOURNAL, its usefulness would increase sufficiently to defray the increased expense. Of this we have no doubt; but it might have occurred to our correspondent to have placed the matter in another light; that the JOURNAL contains other matter than official regulations, and that the proper study and use of its contents would prove of much greater profit and utility to the individual reader than to the company who seeks to instruct and elevate him. The company needs the service of men of much higher scientific attainments than are to be found in the ranks of the mass of the employés, and is seeking, by the only means in its power, to impart the necessary education to enable those who are sufficiently interested in their future advancement in life, to fit themselves for the positions which will be open to them when qualified to fill them. The case stands thus: The officers of the Western Union Company, in their desire to elevate their employés, morally and pecuniarily, established a periodical, at great expense, for that purpose, as well as to disseminate official instructions. Instructive scientific articles are written and illustrated, with great labor; the news affecting the interests of the telegraphist is collected from the entire world; editorials upon the current telegraphic topics appear in every issue, and finally its columns are open to contributions from all who have anything of interest to communicate. In view of these self-evident facts, it seems hardly necessary for us to say that we do not agree with the views of our correspondent, more particularly where he says, "Some feel that if they must pay for information which it is to the interest of the company they receive, the company will wait a long time before they receive it." Of course the information contained in the JOURNAL is entirely valueless to such characters, not even being worth the less than two cents per week, which is what the subscription price amounts to. There are people in this world who do not believe in placing their money out at interest. It is this class for whom our correspondent pleads.

We are glad to have received this communication, inasmuch as it has afforded us the knowledge why every telegrapher is not a subscriber to the JOURNAL, and furnishes an opportunity to present such reasons to non-subscribers that they cannot now fail to see the advantage and self-interest to be derived in becoming readers and subscribers. That many of this class are throwing off the feeling of indifference, both as to the success of the paper and of themselves, is sufficiently evident from the large number of new subscribers which have appeared within the past few weeks, and the fulness of our columns of correspondence is amply indicative of awakening interest.

These indications have been so encouraging that it has been decided to enlarge the paper. With the issues for Dec. 2nd and 16th, the JOURNAL appeared with sixteen pages, and for the future this size will be maintained. This will afford thirty-six columns of reading matter which will be of general interest to every telegraph employé, and not alone to them, but to every one interested in truth and science for their own sakes. Will not every reader of the JOURNAL take the trouble to show the paper to his friends, not only in the business, but outside, and explain to them its merits, its cheapness, and its policy, with a view of inducing subscriptions. In this manner the sphere of its usefulness will be best advanced, and the encouragement given to its projectors and supporters will undoubtedly be rewarded by new improvements and increased efforts (if possible), to reciprocate in, and retain that bond of sympathy and accord which has now become so strong between the officers of the Western Union Telegraph Company and their employés.

Attention is called to the advertisement, in this issue of the Journal, of Dr. L. Bradley, of Jersey City. He has discontinued the manufacture of Telegraph Instruments, and is now manufacturing his "Universal Apparatus" for electric measurement. This apparatus consists of a combination of the Tangent Galvanometer and Rheostat into one instrument, in a compact and portable form. This fact alone should, and probably will, cause it to come into general use, and if the performance of the instrument only nearly equals the ecomiums of its friends, it will be evident that the Doctor has conferred a benefit upon the profession by its introduction.

His naked wire helices are too well known to require comment.

GEN. W. F. SMITH, President of the International Ocean Telegraph Company, has gone to England on business of the company.

PRESENTATION TO MR. M. S. ROBERTS.

On Christmas morning, the clerks attached to the Book-keeping Department of the New York office of the Western Union Telegraph Company, presented their Manager, Mr. M. S. Roberts, with an elegant Buffet.

Mr. Roberts is deservedly popular and worthy of any token of esteem deemed proper by his friends. Having served many years in association with him, we can speak "by the card."

PRESENTATION TO MR. H. B. BERRY.

A few evenings since Mr. H. B. Berry, division operator of the Susquehanna Division of the Erie R. R. Telegraph at Elmira, N. Y., was surprised by a visitation at his house from a delegation of the employés of the division, and presented in due form with an elegant silver tea service, comprising nine pieces. The presentation was made by Mr. G. S. Shepard, of Addison, with a brief, appropriate and humorous speech, to which Mr. Berry appropriately responded. The salver bears the following inscription:

TELEGRAPHERS
OF THE
SUSQUEHANNA DIVISION
ERIE RAILWAY
TO
H. B. BERRY,
CHRISTMAS, 1872.

After the presentation the company was invited into the dining room, where was found two tables elegantly and bountifully provided, of which all present showed due appreciation.

PRESENTATION TO COLONEL JAMES COLEMAN.

The Memphis *Appeal*, of a late date, at the close of a highly eulogistical notice of Colonel James Coleman, late Superintendent of the Western Union Telegraph Company, contains the following:

"The appended letter was forwarded to us, having been addressed to the employees of the telegraphic offices of this department, recently subjected to the superintendency of Colonel Coleman:

"MEMPHIS, December 11, 1872.

"*To the Gentlemen Employees of the Western Union Telegraph Company, Memphis, Tenn.:*

"GENTLEMEN:—I have the honor and pleasure gratefully to acknowledge the receipt of an order, on Messrs. Murray & Ridgley for a fine suit of clothing, being designed as a substantial testimonial of your esteem, upon my retirement from the service of the company. After an intimate personal and official association with you of so many years, I confess to you, gentlemen, that my most tender sensibilities are aroused by this closing act of your confidence and friendship. Whether I have deserved such a tribute or not, it will ever be a source of pride and comfort to myself, that you have so adjudged, and that you have sealed your judgment by your generosity. I have to thank you, not only for this last act of your generosity, but for others preceding it, which have touched my heart and inspired me with a constant sense of the brotherhood which has been engendered by our intercourse, and which, be assured, gentlemen, shall ever be cherished by me while my heart beats responsive to the memory of your more than fraternal kindness.

"With great respect and affection, I am, gentlemen, your friend and brother,

"JAMES COLEMAN."

PRESENTATION TO SUPT. PLUMMER OF THE PACIFIC DIVISION.

On Thanksgiving Day, Dr. O. P. S. Plummer, Superintendent of the Third District of the Pacific Division, Western Union Telegraph Company, was presented by Mr. J. Waldo Thompson, chief operator, on behalf of the operators of his district, with a magnificent gold watch and chain, which had been made to order at San Francisco, especially for the occasion, at an expense of $250, and the name of every contributor engraved upon the chain.

In presenting the watch and chain Mr. Thompson addressed Dr. Plummer as follows:

"Dr. Plummer, I have the honor, as well as the gratification, on behalf of the operators of your district, of presenting you with this watch and chain, as a slight token of the regard and esteem we have for you. May our intercourse in the future be as pleasant as in the past, and when you recall the names hereon engraved, may you always remember we are all your friends."

To which the doctor made an appropriate reply.

The inscription upon inner case of the watch reads:

"To Dr. O. P. S. Plummer, Supt. W. U. Tel. Co., from the Operators of the 3d District, Pacific Division, Nov., 1872."

PRESENTATION TO MR. F. H. LAWRENCE

The operators attached to the Leavenworth, Lawrence & Galveston Railroad, recently manifested their appreciation of their Superintendent, Mr. F. H. Lawrence, by presenting him and his newly-married wife with a beautiful Silver Set, consisting of six pieces—a tea and a coffee urn, sugar bowl, cream pitcher, slop vase, and a hot water urn.

The local Press, in mentioning the above, speak on the highest terms of Mr. Lawrence.

PRESENTATION TO MR. COLIN FOX.

On Christmas Eve, Mr. Colin Fox, Manager of the Western Union Telegraph Company's business in Michigan, was presented by many of the ladies and gentlemen employed by the company in this city, and at other places in Michigan, with a very handsome watch and chain and a service of silver. The persons engaged in the transaction assembled in Mr. Fox's private room in the Telegraph building while he was at tea, and upon his return he was astonished to find his sanctum full of uninvited guests, and with valuable gifts lying on the table. The presentation speech was made by Mr. Geo. D. Kellogg, who has charge of the Western Union office at Kalamazoo.

The watch is a gold American stem-winder, and with the heavy guard chain was gotten up expressly for this presentation. The outer part of the watch bears the monogram "C. F.," neatly engraved, and on the inside is the inscription "Presented to Colin Fox, by the Western Union Telegraph Employees of the Michigan District, Christmas, 1872." The tea set consists of 10 pieces exclusive of the tray, all of which are of satin finish, and are with one or two exceptions gold lined. The gifts are quite costly, and yet are only a fitting tribute to the worth of Mr. Fox as a man and as the manager for Michigan of the Western Union interest.—*Detroit Tribune.*

PRESENTATION TO MR. C. H. FOSTER.

Upon the return of Mr. C. H. Foster, Superintendent of the Indianapolis, Bloomington & Western Railway, from his wedding trip, he was joyfully surprised in receiving from the officers of that Railway, a handsome set of Chamber Furniture, valued at (pecuniarily considered) $200. This evidence of esteem on the part of his employers, must be very gratifying to Mr. Foster, inasmuch as having held his position but for a short time, it speaks well for his efficiency and other good qualities.

He was also the recipient of other valuable gifts on the occasion of his marriage; among them a deed for eighty acres of land, pieces of silverware, &c., &c.

INFORMATION WANTED.

Information is desired as to the whereabouts of Joe Stephenson, telegraph operator. He was at Sanperra, Ind., last June, at which time he was last heard from. His father, John Stephenson, resides at Urbana, Ill. Information may be sent to this office.

DEVELOPMENT OF TELEGRAPHS IN CANADA.

Our attention has been directed by some figures published in a daily journal to the extraordinary increase of telegraph lines in Canada. Such an extension is but a necessary corollary of the rapid increase in railway mileage that each year witnesses. The telegraphs have not only gone with the railways, but keep far in advance of them. That spirit of restless enterprise and unfaltering energy which have given us the Allan line of steamers, and which are characteristics of the principal founder of several important Canadian enterprises, Sir Hugh Allan, mark all the operations of the Montreal Company, of which he is President. Its lines have been pushed everywhere, even to the remotest villages and hamlets of the Dominion. The policy appears to be to anticipate the wants of the country and the demands of the people; to build lines into new districts, whether they offer an immediate prospect of profit or not, leaving the natural growth of business to justify and recoup the expenditure. While this is undoubtedly the policy of success, it is also the best possible thing for the interests of the country.

During the present year the lines of the Montreal Company have been increased by 1,500 miles of new posts, and nearly 4,000 miles of new wire. *Two hundred* new offices have been opened. By the end of this year the Company will have in use 10,300 miles of poles, 18,000 miles of wires and upwards of 1,000 offices. It will be seen, therefore, that this year shows an increase of 20 per cent.—a rate of progress that must be held to justify all the credit for enterprise that it is possible to give the management of this Company.

The new lines have extended up the Ottawa River, through the lumbering districts, 150 miles above that city, and nearly 100 miles north along the banks of the Gatineau River. The Eastern Townships, New Brunswick and the remotest points on the Gaspe coast have been connected by wires with the rest of the Dominion. Northward from Orillia through the Muskoka district, as far as Parry Sound, lines have been extended. From Lindsay they have been erected through Minden and Haliburton; and the extensive counties of Frontenac and Addington have been supplied with branches running to their very remotest settlements. Along the routes of the Canadian Air Line, the Canada Southern, the Hamilton & Lake Erie, the Wellington, Grey & Bruce, the Toronto & Nipissing, the Midland, the North Grey, the Toronto & Muskoka and the International railways, lines have been built wholly or in part.

Plans are already being formed for extension during the season of 1873 which promise to be quite as extensive as those of the season just closed.

No country in the world is better supplied with telegraphic facilities in proportion to the population than Canada. Although the inhabitants of the Dominion are dispersed over so wide an area, rendering them so much the more difficult to reach, yet it appears as a remarkable fact, according to the latest statistics of the English lines, that we have more than *double the number of telegraph stations than in England in proportion to population.* The free use of the telegraph lines by the newspaper press of Canada might be pointed to as a further evidence of the marked development of telegraphic enterprise amongst us. That Canadian journals are able to give as large an amount of telegraphic news as those of any country in the world, not only demonstrates the energy with which they are conducted, but implies the possession of superior facilities for obtaining news cheaply and expeditiously. We may add that the public need not be reminded in what a large measure they are indebted for telegraphic facilities to Mr. H. P. Dwight, the Superintendent of the Montreal Line. The extensions in Ontario are all conducted under his direction, and many a distant locality now blessed with a line of telegraph may attribute the fact to the quick perception of Mr. Dwight in anticipating their wants, and pointing out the necessity of meeting them without hesitancy or delay.—*Toronto Monetary Times.*

TELEGRAPHIC COMMUNICATION WITH THE MEXICAN CAPITAL.

Telegraphic communication with the City of Mexico, by way of Matamoros, has been re-established, and a telegram was received in New York on Tuesday, 17th ult., from the Associated Press of Mexico to the press of this country, through its organizations, offering congratulations on the event, and extending an invitation to American representatives to be present at the inauguration of the completed railroad between the City of Mexico and Vera Cruz, on the 1st of January.

GEO. T. WILLIAMS,

56 WEST 3rd STREET,

Cincinnati, Ohio.

Manifold books of superior quality for TRAIN ORDERS furnished on short notice.

This system now in vogue upon several Railroads in the West is very highly commended.

Correspondence solicited.
Agate and Steel points for manifold writing always on hand.

GEO. T. WILLIAMS.
P. O. BOX 613.

The United States Telegraph M'fg & Supply Co.

IS PREPARED TO FURNISH ALL KINDS OF

Telegraph Instruments and Machinery,

In the most approved Style and Finish.

All Copper Wire used carefully tested and conductivity equal to Ninety-Eight per cent. pure Copper guaranteed.

We are prepared to cover this wire with silk and furnish it to the trade.

Special Attention is given to adapting Instruments to the circuit or work required, and information on these questions cheerfully given.

Orders or Communications to be addressed

WM. D. SARGENT,
Business Manager,
812 RACE ST., PHILADELPHIA.

Dr. L. BRADLEY,

No. 9 EXCHANGE PLACE,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is $200 to $230, according to style, &c. Price, Tangent Galvanometers, $40 to $60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-300th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

JOURNAL OF THE TELEGRAPH.

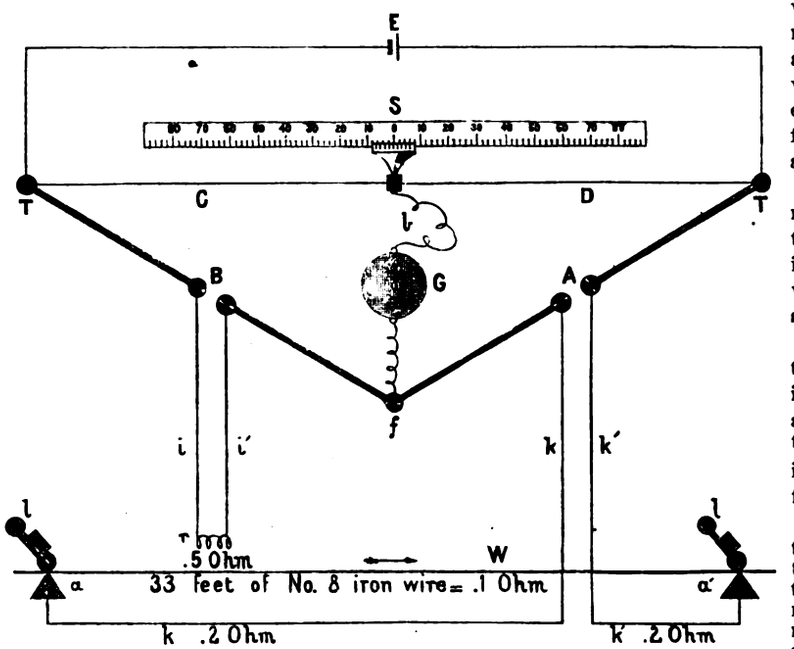
VOL. VI. NO. 4. NEW YORK, JANUARY 15, 1873. WHOLE NO. 125.

STEARNS'S APPARATUS FOR MEASURING RESISTANCE OF TELEGRAPH WIRE.

The accompanying illustration represents an apparatus designed and employed by Mr. Joseph B. Stearns, for measuring the resistance of telegraph wire, at the manufactory. *a* and *a'* are ∧ shaped steel contact supports, over which the wire whose resistance is to be measured, is drawn by a winding drum. *l* and *l'* are weighted levers for keeping the wire in connection with the contact points. A, B, C, D, are the four sides of the Wheatstone Balance. G is a galvanometer, one terminal of which is attached to the junction *f* of the sides A, B, the other terminal being connected with a vernier sliding upon the graduated scale S, and carrying a rider for making contact between the bridge wire *b* and the sides C, D, of the balance. *k* and *k'* are wires connecting the contact pieces *a* and *a'* with the branch B of the balance. *i* and *i'* are wires connecting a standard resistance *r* with the branch A of the balance. E is a battery attached to the terminals T, T, of the balance.

The standard resistance *r*, is made equal to that of a definite length of the wire to be tested, say one tenth of an ohm, and is composed of wire of the same size and quality as that which is being tested, and is placed in the same room with and near the latter, that both may be equally affected by changes of temperature.

The measuring apparatus must necessarily be situated at some distance from the place where the wire is handled, to prevent the constantly changing masses of wire and the jar of the machinery from influencing the galvanometer.



The two sets of leading wires *i i'* and *k k'*, are of the same size, length and quality, each set having a joint resistance of say four-tenths of an ohm, and are so placed as to be equally subjected to changes of temperature.

The total resistance in each side of the balance is thus made five-tenths of an ohm; and when the vernier is placed at zero of the scale and the battery circuit is closed, no current passes through the galvanometer.

Having given a general description of the apparatus, let us describe its practical operation. Suppose, for example, we desire to measure the resistance of a No. 8 iron wire, the maximum resistance of which must not exceed 16 ohms per mile. The contact points *a* and *a'* are for convenience placed at such a distance that the resistance of the section of wire between them shall be a definite unit, say one-tenth of an ohm. This, for the quality and size of wire above mentioned, would be precisely 33 feet. In other words, if the resistance of one mile, or 5,280 feet of wire equals 16 ohms, then the resistance of 33 feet of such wire would equal one-tenth of an ohm.

The end of the wire from a bundle to be tested, is now drawn from the reel through the contact points *a a'* and to the winding drum. While the workmen are attaching the end of the wire to the drum, the person in charge of the measuring instruments observes that the needle of his galvanometer does not stand at zero and he moves the vernier to the right or left, as the case may be, until the desired equilibrium is obtained. If the vernier has been moved five divisions to the right, and the whole scale is divided into six hundred equal parts, it will be manifest that the resistance of the tested wire is *less* than that of the standard, and a simple calculation will show how much less it is, thus 305 : 295 : : .1 : . 0967x10x16—15.47 ohms per mile; or, if the vernier has been moved one division to the left, then 299 : 301 : : . 1 : 10066x10x16—16.105, and shows that the wire has a resistance of 16.1 ohms per mile and is to be rejected.

The scale, instead of being divided arbitrarily, may with advantage be so divided as to show definite degrees of increase or decrease in the resistance of the tested wire; for example, one division of the scale may correspond with an increase or decrease of one-tenth of an ohm per mile in the tested wire, which was very nearly the case with the one used at the factory of Messrs. Farrar, Follett & Co. When the scale is thus adjusted, it is only necessary to observe the position of the vernier upon the scale to know exactly the resistance of the wire *per mile*.

By placing a delicate polarized relay in the bridge wire, and using a battery of somewhat greater strength, the apparatus may be made to automatically report to the person in charge of the wire room any defect or undue resistance of the tested wire by ringing a bell, or by tripping a magnetic escapement or detent to stop the winding drum, by shifting the belt, or otherwise. When so arranged, the services of an observer in the instrument room may be dispensed with.

Mr. Stearns measured at the factory of Messrs. Farrar, Follett & Co., at Boston, nearly one thousand miles of wire with the above described apparatus, with such minute accuracy that the variation of the thousanth part of an ohm was always detected.

During the early part of the testing about a dozen miles of wire was rejected as faulty, but it was afterwards discovered that this supposed fault was due to the fact that the wire was measured before it thoroughly cooled after passing through the galvanizing vats, and on again being measured every bundle, with the exception of a few containing imperfect joints was accepted.

In making these careful measurements, Mr. Stearns first made use of the Differential Galvanometer, but the indications proving untrustworthy, it was abandoned in favor of the Wheatstone Balance.

The contact points *a a'*, were at first two sets of rollers, but their resistance increased so rapidly, and was so variable, that they too were abandoned for the steel ridges, which gave entire satisfaction, and did not injure the surface of the wire.

It is almost unnecessary to observe, that great benefits would accrue to telegraph companies should they adopt this apparatus, and have all the wire manufactured for them, tested and measured at the factories by their own agents.

This close scrutiny and supervision of every foot of wire, would lead to greater carefulness on the part of the manufacturer, and would not only insure a wire of low and uniform resistance, but a good wire in other respects, for a low and uniform resistance implies a good quality of iron of uniform texture.

The one thousand miles of wire, before referred to, was tested under the direction of the Telegraph Company, and so great was the solicitude of the manufacturers that the wire should not exceed that stipulated in the contract, that they actually produced a better wire than had up to that time been known. The wire was a small number eight, weighing only 358 pounds per mile, yet much of it offered a resistance of less than twelve ohms per mile, and none of it measured as high as fourteen ohms per mile.

This excellent grade of wire, known as the "Union Brand," has since that time, and partially in consequence of these measurements being made known, acquired a deservedly high reputation.

LIGHTNING AND LIGHTNING CONDUCTORS.

A Paper Read Before the Society of Telegraph Engineers, London.

The seventh ordinary general meeting was held on Wednesday, November 27, C. W. Siemens, Esq., F. R. S., President, in the chair; when, after the usual routine business, a paper was read "On Lightning and Lightning Conductors, by W. H. Preece, Esq., Member Inst. C.E., and S.T.E., &c.

The number and intensity of the thunderstorms which have raged over this country during the past season, as well as the accidents which have accompanied them, have been so far above the average that they have attracted unusual attention to lightning and the means at our disposal to protect ourselves, our buildings, and our apparatus from the destructive effects of electrical discharge. This, therefore, forms a most interesting subject for discussion before this society. Recently the partial destruction of that magnificent building, the Escurial, one of the chief glories of Spain, and called the eighth wonder of the world, has added considerably to the interest felt in the subject.*

In this country, not only have trees been shattered, cattle destroyed, public buildings struck, and private houses injured; but human beings have been killed in such numbers, that if tabulated, they would probably cast into the shade the massacre committed by even our railway trains. The average number of deaths due to lightning in England, previous to this year, was 18; in France it was 95.

Mr. Symons, the well-known meteorologist, who has for many years devoted much attention to this subject, mentions that in two storms in June last nearly two hundred separate accidents came under his own knowledge, including the death of ten persons and injury to thirty-three others; upwards of sixty houses were struck, ten or fifteen of which were burned down. Twenty-three horses and cattle and ninety-nine sheep were killed. This is the imperfect record of only two storms. What must it be for the whole year?

But it is the damage done to our telegraphic system that more immediately interests this society. I am able to give fairly complete returns of the injury inflicted on the apparatus and plant of the Postal Telegraph Department, and I am in hopes that the discussion which this paper is intended to inaugurate will elicit much important information of the damage done to our extensive Railway Telegraph System. The returns have been tabulated, and will accompany this paper as an appendix.

From January 1st to July 31st, 1872, of 9,475 instruments of different form in use in the department, 897 or 9·46 per cent. were injured. The different classes and number of apparatus used, and the amount of injury received by each, were as follows:

Instrument.	*Number in use.*	*Number damaged.*	*Per cent.*
Automatic	108	Nil.	
Hughes'	23	"	
Morse { Galvanometer	1943	87	3·24
Morse { Recorder	1943	7	3·24
Morse { Relays	1943	19	3·24
Single Needle	3536	364	10·29
Double Needle	77	2	2·6
Alphabetical	3303	374	11·32
Bells' (Bright's)	485	22	4·55
Protectors	....	73	
Total	9475	897	9·46

* The Escurial, since its completion, in 1584, has been on fire no less than seven times, viz., in 1587, 1590, 1671, 1744, 1766, 1796, and 1872. The causes of two of these are unknown; but at least four of the fires arose from lightning, yet there never has been one lightning-rod introduced in the Palace.

The actual or direct estimated cost of these injuries is £905, that is, £905 is the direct claim of the Postal Telegraph Department against *Jupiter tonans*, but it by no means represents the indirect claims of the department against that potentate. Thus it is impossible to estimate the loss of time on the part of the staff engaged in maintenance duties in visiting and revisiting stations damaged by lightning, or the effect of the delay in repairing the circuit upon the revenue, and the consequent detriment to the business. The total cost must be very large. If the damage inflicted upon our railway telegraphs and the delay to the traffic caused thereby were also estimated, it would be seen that our direct and indirect claims against Jove would bear a comparison with the historical Alabama Claims.

1—*Atmospheric Electricity.*

I do not propose in this paper to discuss the cause or nature of atmospheric electricity. It is sufficient for our purpose to admit the existence upon the surface of our earth and in our atmosphere of that great form of energy called *Electricity*. To study the effects of *Heat* it is not necessary to discuss its nature, and the great laws of *Gravity* have been determined without reference to the inscrutable mystery of its causation. I, however, do not hesitate to assert it, not only as an opinion, but as a fact well substantiated by experience and by reasoning, fathered by the greatest lights of our science, and taught by our leading philosophers, that electricity is no more matter than is heat, or light, or sound. Modern physicists know no such thing as the so-called electric fluid, *as a fluid;* that is, Electricity does not exist as a mass occupying space, and moving from point to point in such a way as to justify the assertion so often made that "it enters here and makes its exit there." It is one form of energy, and therefore necessarily *force* and not *matter*, displaying its effects in various useful, beautiful, and terrible ways. While the earthly theorists have imparted into our language terms based upon the hypothesis of a fluid—notably "current"—there is no objection to the continuance of these terms provided they do not convey to the mind erroneous ideas as to the nature of the force whose effects they symbolise. A current of electricity is a clear, well-defined term, raising in the mind at once an idea of its character; but it by no means implies the transference of matter from one point to another.

Thunderstorms are but gigantic repetitions of simple experiments. They are but elementary electrical phenomena, differing only in degree from those which cause the ordinary snapping spark from the machine, or the loud report from the Leyden jar. Electrical discharge, whether indicated by a *current*, by the *brush*, by a *star* or *glow*, or by a *spark*, depends simply upon the existence of two points at different potentials, separated in the first case by a conductor, in the latter cases by a non-conductor. In the case of the conductor, we have the ordinary electric current, and in the case of the non-conductor when the difference of potential is high enough, we have the disruptive discharge, accompanied with its usual explosive and luminous results. In any case of electrical discharge, either that indicated by a spark from a lump of sugar, by a disruptive discharge of a Leyden jar, or by a flash of lightning, there must be two conducting masses in opposite electrical states, separated by a non-conductor or dielectric.

These masses may be two thunder clouds, or the earth and a thunder cloud, oppositely electrified, separated by the air, forming the simple conditions of an ordinary condenser.

The discharge, whether from a Leyden's battery, or from Heaven's Artillery, must be instantaneous, and continuous along its whole path. The light we see is the effect of the discharge. It is indeed, as its color and as the spectroscope has shown us, simply incandescent matter. It indicates the path of the discharge and nothing more. When lightning is seen the danger is past. Persons who have been killed by lightning can have seen nothing of it. Their death must have been instantaneous. The placid state of their features is an indication of its painlessness. Persons who have been struck have stated that they have seen nothing and only felt a blow.*

The magnitude of the discharge depends upon the quantity of electricity present, and the distance through which it occurs. The path is prepared beforehand by induction. The particles of air or other matter in its path are raised to such a high state of polarization, that they are in a state of "tottering equilibrium," and the slightest acquisition of potential or diminution of resistance, either by approach of the conductor or increase of quantity, destroys this condition, and we have discharge with all the effects of light, heat, and mechanical energy. A ship sailing calmly over the ocean, a moving railway train, a horseman galloping home for shelter from the approaching storm may prove the last straw to break this camel's back.

The air which we breathe is invariably found all over the surface of the earth to be in a state of electrification. It is usually positive in fair weather, except a thin stratum in contact with the earth. Its potential increases as we ascend; but even at the same place, its potential and character vary at times, particularly when thunder is heard in the distance.

It is usually assumed that the great masses of clouds, called thunder clouds, are themselves the generators or sources of those great charges of electricity which result in thunder and lightning. It is, however, very doubtful whether this be so; but it is more probable that the clouds merely act the part of the coatings of a Leyden jar to accumulate and concentrate the charge in points. Clouds have even been known to be absent when a discharge of lightning has been evident; and discharges have frequently been observed to be repeated from the same cloud. Moreover, a very simple and well-known experiment shows that the charge of a Leyden jar exists—not in its coating—but in the dielectric which separates its coatings. In the same way a charge which terminates in a thunder clap exists in the air and not in the cloud.

There is a beautiful experiment of Franklin's, which illustrates the accumulative action of a cloud moving through polarized air.

1. Apply a charge to A and draw it gently to A^1. The charge will be found distributed.

2. Reverse the motion, the charge will again accumulate on A.

3. Charge the entire surface by a removeable coating, then draw A gently to A^1—discharge will take place two or three times during its motion.

A represents the cloud, B the earth, and C the air.

Thus, a moving cloud may merely act the part of a carrier or accumulator of the charge which exists in the air.

* Tyndall says:—"The nervous system requires a certain interval of time to become conscious of pain. The time of an electric discharge, is but a small fraction of this interval; hence, as a sentient apparatus, the nervous system is destroyed before consciousness can set in. If this be true, and there are the strongest ground for believing it to be true, death from lightning must be painless." (Notes, p. 16.)

Digitized by Google

Lightning is usually classified into *sheet*, *forked* and *ball* lightning. *Sheet* lightning is merely the reflection of forked lightning, or the electric discharge which has occurred somewhere out of the field of view. *Forked*, called also *zig-zag* or *chain* lightning, is the light produced by the disruptive discharge between cloud and cloud, or between cloud and earth. *Ball* lightning is of a very different character. Many of these so-called "balls," are undoubtedly optical illusions, and Faraday, himself, stated that they were incompatible with what we know of electric discharge. "There may be balls of fire," said he, "but they are not electrical." Yet the evidence of balls of blue fire rolling along the surface of the sea, and suddenly terminating in terrible electric discharges over ships; masses of fire rolling along the ground towards buildings, ending in fatal discharge, and many other cases, leave it unquestionable that some such phenomenon as globular or ball lightning exists. Some have explained them to be balls of incandescent gas, rendered so by the discharge; but Mr. Cromwell Varley has recently offered a more acceptable explanation. According to him, ball lightning is a luminous spot on the earth, terminating a current or brush discharge from a negatively charged cloud. This spot moves with the cloud. Illuminated lines of force are projected from some point in the cloud upon the earth. He has been very successful in repeating the effect experimentally, and he suggests this fact as an explanation of the photographic images imprinted on the skin of persons struck by lightning.*

I quote from memory: "When after a serene sky, thunder clouds form in the distance, the observer sees the clouds and the illumination of the lightning displayed before him as a magnificent picture; and what he often takes to be forked lightning (*i. e.*, the actual flash, and not the reflection of it), appears to run through the clouds in the most beautiful manner." "That which is thought to be the electric discharge, is only the illuminated edge of a cloud, beyond and behind which the real discharge occurs. It is in its nature like the bright enlightened edge which a dark well-defined cloud often presents when between the sun and the observer, and even the moon also frequently produces similar appearances. In the case of its production by lightning and distant clouds, the line is so bright by comparison with the previous state of the clouds and sky, so sudden and brief in its existence, so perfectly defined, and of such a form as to lead everyone, at the first moment, to think it is the lightning itself which appears." . . . Hence many of the errors made as to the character, shape, and condition of the lightning flash.†

The discharge of a Leyden jar, of an induction coil, or that which is succeeded by lightning and thunder, invariably occurs along the line of least resistance. It has been found, in every accident which has been investigated, to follow the ordinary laws of the transmission of electricity, laws which are simple and thoroughly well known. This line of least resistance may be made up of metals, of bricks and mortar, of trees, or of animal flesh. Whatever in fact offers the least resistance will be the chosen path. It need not, necessarily, be a single track, for both in experiment with machines and with induction coils, as well as in the observation of the great experiments of nature, it is frequently found that the path is bifurcated, and often divided into three or even four lines. Thus the electric discharge in the air is a simple case of the electric discharge between two electrified conductors which have acquired such a difference of potential as to break through the resistance of the dielectric which separates them, violently displacing its particles, and completely altering its physical features.

There is nothing hidden, mysterious, or unknown in the laws of atmospheric electricity. They are simple cases of the ordinary well-known laws which are as "familiar in our mouths as household words."

II.—*Its Effects.*

The effects of atmospheric electricity are perhaps better known than those of any other natural phenomenon. They have been principally studied in their destructive results upon ships, upon buildings, upon human beings, and—in our own particular sphere—upon the instruments employed for telegraphic purposes. The case of a ship is very different from that of a building, or an apparatus within a building. A ship is a prominent object—generally a conductor—situated upon a plane—the sea. It thus, if a thunder cloud passes near it, at once reduces the line of resistance between the sea (the inner coating) and the cloud (the exterior coating) of the condenser, determining discharge. Hence it is that, so often it has been observed that a heavy black cloud is approaching the ship; and, without any previous warning whatever, a great flash of lightning or an apparent ball of fire has seemingly descended upon the ship, followed at once by an awful clap of thunder. On the other hand, buildings irregular form but an insignificant feature in the large area exposed to induction from a charged cloud. Trees and buildings take but a portion of the charges which in the case of ships have fallen in their whole intensity upon them. Except in the case of very prominent church spires, columns, &c., it is probable that the effects upon buildings are immeasurably smaller than ships. Again, in the case of human beings it is probable that but a small portion of the discharge passes through them; while in the case of telegraphic instruments the quantity of of electricity which passes through them is still smaller.

From these causes, the methods that have been adopted for protection based upon the damage inflicted on ships, have probably led to the adoption of unnecessarily costly and superfluous measures to protect buildings and instruments.

We, in this Society, are more interested in the effects of lightning upon instruments, and upon the apparatus constructed for the transmission of telegraphic despatches, though we neither ignore nor neglect its efforts in other fields.

The accidents that telegraphs suffer from might be divided into three classes:

1. Those affecting the wires;
2. Those affecting the poles; and
3. Those affecting the instruments.

Each of these classes may be sub-divided into those which are the result of the *direct discharge*, and those which are the result of *induction*. In the first case the wires, poles or instruments form a path or current for a portion of the discharge itself; in the second place they are influenced by currents which are induced by the approach, mersion, or sudden neutralisation of charged clouds.

1. (*a*) Direct Discharge.—The direct effects are not nearly so numerous as the induced. In the case of open wires, the discharge forms but rarely anything more than an instance of the passage of a very powerful and instantaneous current. Cases have occurred, however, where this current was so great as to fuse and destroy the line-wire; but such cases are very few and far between.

During the past season I can find but two cases where our line wires—viz.: No. 8 wires—have been absolutely fused.

(*b*.) Induction.—It is evident that the accumulation of a charge upon a cloud converts it into a very powerful inducing body. As the cloud approaches the line it induces in the section of the wire nearest to it an opposite electrical state, and as this change of state is gradual, a current of sensible duration must be observed; but when discharge takes place and the cloud suddenly loses its coercive power, the wire as suddenly recovers its neutral condition, producing a powerful current in the opposite direction. Hence, during a thunder-storm, wires are pervaded by repeated currents which ring bells, demagnetise needles, throw apparatus out of adjustment, shock clerks, and make false signals on railway block instruments. During the construction of the Hoosac Tunnel, two premature explosions of blasting charges were caused by these currents, producing serious and fatal results.

Not only the over-ground wires were affected, but those buried two feet deep under ground. I print as an appendix to this paper a very interesting correspondence which took place in the year 1854, between Faraday and Messrs. Latimer Clark, and Culley, upon the demagnetisation of needles upon the long underground circuits between London and Manchester, and very recently (July, 1871,) while some joints were being made upon the new underground wires between Manchester and Liverpool, the jointer was alarmed by a succession of crackling sparks passing from the wires to his box, which was in contact with the ground.

2. In the cases of poles, it has been found that when the pole has formed a portion of the path of the discharge, it has been, in the case of an unprotected pole, shivered to atoms, and one instance occurred where twenty successive poles were very nearly totally destroyed. Usually, however, a discharge which has taken the wire in its path, divides itself amongst several poles, and cuts out, with the smoothness of a gouge, spiral grooves from the top of the pole to the bottom.

3. In the case of instruments, the effects have been:

(*a*) From Direct Discharge.—Currents of such a strength as to absolutely burst out the cases, burn the woodwork, and fuse the wires of the galvanometers and electro-magnets. An exceptional case of accident has arisen from the wires passing close to gas pipes and the discharge passing across the air fusing the pipe, lighting the gas, and setting the station on fire. Such cases are, however, rare, and have generally occurred at "intermediate" stations where no earth was employed.

(*b*) Induction.—The induced currents being instantaneous and very strong, demagnetise or reverse the polarity of magnetic needles such as those of galvanometers. This was a very prolific source of trouble in former days, but we have recently introduced induced needles which have almost entirely removed the evil. The needle inside the coil deflected by the working current is not a permanent magnet, but a piece of soft iron temporarily magnetised by the influence of permanent magnets outside the coil; but even these external magnets are sometimes demagnetised.

* C. F. Varley, Trans. Royal Society, January, 1871,

CORRESPONDENCE.

CONCENTRATION AND QUICKNESS.

To the Editor of the Journal of the Telegraph:

We carry within us an intuitive gauge of our own capabilities, and it is not often that any one strongly desires to attempt that for which nature has entirely unfitted him; it is seldom from constitutional incapacity that we fail to reach the heighths of our earnest aspirations; but because we do not know how to manage ourselves; to hold the will with a firm, true hand, and teach the wandering, restless brain to do its work to advantage and without undue waste.

Where there is a natural foundation to build upon, it is wonderful how rapidly a single faculty will grow, strengthen, and develop, when subject to regular, judicious exercise.

An operator wants every energy to center at once upon the work in hand; no floating of the thought upon a half-conscious day-dream, or curious notice of passing scene, to scatter and sap the nervous force; the foundation of quick and reliable thinking is concentration, and this is the first thing to be acquired. There are many ways of developing this faculty, and some excellent lessons in telegraphing are easily learned after the office doors have been closed behind us. The following hints may be useful: While in the street, glance at a house, giving it for a moment your whole attention; then turn away and try to remember how many windows are visible. Count in the same way a group of men or animals, or other objects which present themselves: or in passing a store, endeavor to take in the articles displayed; fix them and their arrangement in your mind, and the next time you go by, look if the impression was correct.

Forcing the attention and keeping it fixed right there, is also good practice. Here we can operate a little on Sunday, without fear of the sin of Sabbath-breaking. How pleasant in church, particularly if the sermon is prosy, to let the mind wander at will on a misty dream, or rest in some delightful remembrance; the monotonous tones of the minister's voice serving as a lullaby to your semi-conscious state of mental luxury! Rouse up! Do not for an instant listen to the siren imagination; rivet your attention upon the sermon, and keep it there; hear every word if possible, and weigh each thought. If you go home with a tired brain, and the headache, it shows how much the lesson was needed. After a few efforts of this kind, at church or lecture or whenever occasion offers, you will be surprised at the progress made in ability to keep the mind on a given subject.

The writer claims no originality in these ideas, or, indeed, in any that have been advanced; they were gained from others who know more than herself about intellectual culture. Their practical utility is obvious, and the student who avails him or herself of this mode of improvement, will find no end of opportunities occur for the development of quickness and concentration.

"I am, as God made me," is the weak and cowardly excuse we often make when our imperfections rise up in glaring distinctness. No, we are as we make ourselves. God builds the house, it is for us to fill and adorn it, each room with appropriate furniture. Let no appartments be found empty and covered with dust; hang on the walls pictures of bright and true thoughts and records of honorable deeds; sweep clean the hearth, and keep burning the fire of neighborly love and kindness; let the couches invite to repose, pillowed with the down of a quiet conscience; allow nothing unclean to mar the pure whiteness of the paneling; open the doors to heavenly visitants; and, above all, throw wide the windows for entrance of God's beautiful sun, bearing on golden rays the warmth of His everlasting love, and the light of His never-failing wisdom. A.

CLINTON, IOWA, Dec. 18.

To the Editor of the Journal of the Telegraph:

Your remarks on page 9, December 1st, of JOURNAL, leads me to suggest that in June or July next, the different agents of the Telegraphers' Mutual Life Insurance Association, together with the present officers of the association, meet in New York, with a view of inaugurating a system for carrying on the association which will reach into every section, and prove more satisfactory, if possible; and I would consider that the plan of the "Conductors' Life Insurance Association" would probably meet our wants better than any other I know of. Our representation, it seems to me, should be based upon *numbers* in large cities, and elsewhere by railroads. The expenses of the delegates would, of course, be paid by members making up the list represented.

All honor to the New York gentlemen who have thus far "run" the association, and now I hope the time has come when their burden can be lightened. All who are members seem to wish to have a voice in the management of the association.

E. O. WAIT, *Manager.*

In the JOURNAL of December 2, 1872, somebody is very much exercised about Rule 54. How do you reconcile Rule 54 with Rule 13. I have always been willing to furnish the desired information to my customers—but do it according to Rule 13. If these two Rules are in harmony with each other, please explain through the JOURNAL.—T. F.

Answer.—We do not see that the two rules conflict in any manner. Rule 13 provides a means whereby the sender of a message may be informed by the manager of the office where it is received, whether the message has been delivered to his correspondent or not. Rule 54, has reference to messages requiring answers from the parties to whom they are addressed, and provides that all such messages shall have the word answer plainly written upon the envelope, and that the messenger shall be instructed to make diligent efforts to obtain it. Should the messenger fail to get the answer, he must give the reason in writing to the delivery clerk, who will notify the office from which the message is received. *Messengers must in all cases be supplied with No. 2 blanks, upon which messages can be written.*

Will you have the kindness to answer me through The JOURNAL, the following question:

"A repeating station receives a message from another station to be repeated, with the check sent in this manner, 'D H, R R S.' but office where it terminates holds it for a check, looking to the repeating office for the check, and sends an office message to the repeating station that he is holding such a message for check from him. Should repeating office be looked to for check or the office where the message originated?"

Answer.—The repeating office should not have received the message without the number of words being stated in the check. It is not necessary to add R.R.S., the check, 10 D.H. is sufficient. The office receiving it from the repeating office should look to the latter for the proper check.

Will you please give through the columns of the JOURNAL the rule for counting messages like the following:

"Send thirty-five (35) dollars." Would the figures inserted after the number be counted, and if so, if there were more figures than words to represent the number, what is the rule?

Answer.—We have answered the above inquiry, in substance, in almost every issue of the JOURNAL during the past year. The rule is that when amounts or numbers are duplicated in figures, the figures shall be counted as containing the same number of words as the amounts which they represent when written out. For example, "Three hundred and fifty (350)" would be counted eight words—while "three hundred fifty (350)" would be counted six words. Ten thousand (10,000) would be counted four words.

M. H.—Both operators were wrong, and clearly showed more inclination to gratify their own tempers than to facilitate the business of the company. There is no possible excuse, under any circumstances, for any operator to fight for circuit. If the circuit is improperly taken by another office, it should be given up promptly, in order that valuable time should not be lost, and the conduct of the offending office should be immediately communicated to the Superintendant for his action in the premises.

Virginia.—We are very desirous that all employés of the company should be able to enjoy the blessed privilege of attending church, and there is no disposition on the part of any of the powers that be, to favor the employés of the company situated in one section of the country over another, in this, or any other respect. We cannot say whether the operators in the East need more of the influence of Divine teachings than those in the Southern States; but we take it for granted that there is no danger that any of them, in either section, will receive too much. We shall very cheerfully aid you in having uniform Sunday hours on all of the Divisions, and we hereby invite suggestions from the Superintendents in all sections in regard to the adoption of uniform Sunday hours.

Inexperience.—The instructions given in tariff-book should be followed for local rates.

Lazarus.—You should put a postage stamp upon such messages, and enter the expenditure in your account current, with an explanatory note.

Manager.—No half rate message can be sent for less than twenty-five cents.

All authorized transfer offices have been furnished with the necessary instructions for conducting the business Offices not so authorized have no right to receive moneys to be paid out at other places. If you have occasion to do such business, make application to your Superintendent to be made a money order office.

E. W. S.—Fitchburg should not have sent the words "141 Pembroke street, Boston, Mass.; send answer there," unless such words were paid for; and Ludlow should have insisted upon these words forming a part of the check when he received the message. Ludlow was not authorized to send the answer to Boston collect as the original message did not come from Boston.

R. B. H.—Many thanks for your efforts on behalf of the JOURNAL. Will send papers direct, as you suggest.

W. C. L.—Thank you. Poetry is hardly in our line. Put your ideas in prose.

FOREIGN TELEGRAPHIC ITEMS

THE TELEGRAPH IN MEXICO.

The telegraph line has been completed between Mazatlan and Durango. The former city hopes to be in telegraphic communication with the capital at an early day. Another line is being constructed between Campache and Minatition.

A company of Mexican capitalists has been formed for the purpose of constructing a national telegraph line between the City of Mexico and the northern frontier, to follow the line of the proposed interoceanic railway, and pass through all the principal towns and cities.

THE ORKNEY AND SHETLAND CABLE.—The Scrabster correspondent of the *Scotsman* has ascertained that the defects in the Pentland Firth Cable are much greater than were at first supposed, and have necessitated the lifting of the entire cable from Caithness to Orkney, a distance of about fourteen miles. At various places the outer wire coating was found to be cut through, at others the twinings of the wire were unlaid, and the cable was otherwise much chafed. A month must elapse before the cable will be ready for re-laying, as wherever any defects appear it will have to be cut, tested, and spliced anew. From the very exposed route in which the cable was laid, it is doubtful whether it will remain workable for any great length of time in the position in which it has hitherto lain, the ground being composed of sharp rocks for the greater part of the way, especially at the Orkney side, and the current at spring tides in the Firth very strong, running at the rate of eleven knots an hour. To resist the friction arising from such a current would require a cable weighing about twenty tons to the mile, whereas the cable now about to be relaid weighs only about five tons to the mile. It is considered that if the route from Holborn Head, in Caithness, to Stromness, in Orkney, by Hoy Sound, were chosen, the current would not be felt nearly so much, and the ground, not being so rocky, would be better adapted for a cable route. As the Government now intend to take the management of it into their own hands, it is expected that in the future more satisfactory arrangements will be made.

THE directors of the British Indian Extension Telegraph Company have declared a further interim dividend of 6s. per share on account of the profits of the year ending 31st ult., payable on and after the 6th of January. In order to provide additional working capital for the business of the undertaking, the Telegraph Construction and Maintenance Company invited applications on Wednesday for an issue at par of £150,000 seven per cent. bonds, payable at the end of three years. The whole of these bonds were applied for in the course of the day, and the price closed at 1 to 2 premium.

IN 1867 there were in New Zealand 1,447 miles of wire, and the amount received for messages was £14,295. In 1870 there were 3,159 miles of wire, through which 181,860 private and 56,335 Government messages were sent, the total charge for which was £27,442. Since then the progress has been very considerable.

UNDER date of Kingston, January 9, 1873, we learn that the cable expedition will return to England on Monday, as the effort to recover the Aspinwall cable has been abandoned for the present.

SIR CHARLES BRIGHT had left for Santiago de Cuba.

POST OFFICE TELEGRAPHS.—The total number of messages forwarded from Postal Telegraph Stations in the United Kingdom during the week ending 7th December, 1872, and during the corresponding week of 1871. Week ending December 7, 1872, 285,646; week ended December 9, 1871, 229,383; increase in the week of 1872, on that of 1871, 56,263.

POST OFFICE TELEGRAPHS.—The total number of messages forwarded from Postal Telegraph Stations in the United Kingdom during the week ending the 14th December, 1872, and during the corresponding week of 1871, week ending 14th December, 1872, 291,117; week ending 16th December, 1871, 238,669; increase in the week of 1872, on that of 1871, 52,448.

THE Queensland authorities propose to devote £60,000 to telegraph extension purposes. The wire is to be manufactured in England.

THE New York, Newfoundland and London Telegraph Company have decided upon abandoning the greater portion of their land line, which terminates at Cape Ray, and on sending the whole of their messages through the submarine cable recently laid from Placentia *via* St. Pierre, to Sydney, in Cape Breton.

FURTHER steps have recently been taken for the complete amalgamation of the Anglo-American, the French Atlantic, and the Newfoundland Companies, touching which a recent prospectus recites the various rights and concessions of the companies, among which is the right to select, free of charge, 100 square miles of land in Newfoundland. The revenues of the Anglo-American Company amount to a payable rate of 12½ per cent.

A return made by the Treasury, in pursuance of the Telegraph Act, shows that the net produce of the work done by the Telegraph department in 1871, viz., £244,821, was applicable as follows: £233,081 to pay interest on the £8,238,757 consols, leaving £11,740 surplus balance to be applied as a sinking fund in reduction of the debt. But since the end of the year 1871 the debt has been reduced by the cancellation of £54,772 stock purchased with the £50,869 surplus balance of the year 1870.

AN extraordinary general meeting of the Eastern Telegraph Company (Limited), was held on Saturday last (the 7th inst.), when the chairman having observed that it was, he belived, the first general meeting of the amalgamated company, asked permission of the shareholders to give their sanction to the laying of a duplicate cable between England and Lisbon. Egypt, he observed, complained of the want of telegraphy, and they had about £14,000 of cables in store that could readily be laid between islands in the Levant. The cost of the England-Lisbon cable would be about £258,000. A suggestion was made that the company should first see whether the Government contemplated the purchase of the submarine cables; this, however, was overruled, and a resolution according the desired permission unanimously passed. The extra capital the company could raise, without further powers, was stated to be £403,000.

ON Monday afternoon, Dec. 9th, the Lord Mayor of London received the following communication through the direct Spanish cable just laid by the India Rubber Gutta Percha and Telegraph Works Company between Bilbao and the Lizard; "The Alcade of Bilbao, in the name of the Ayuntamiento, sends respectful greetings to Senor the Alcade of London, on the successful completion of the means of telegraphic communication between the two ports."

NOTICE is given by Mr. A. A. Martin, chief operator at Colon, of the Jamaica and Aspinwall cable, that during the interruption of the cable the agent at Panama, Mr. P. Mullarkey, manager of the Panama Railroad Company's Telegraph, will receive messages, and forward the same by steamer to the agent at Kingston, Jamaica.

THE Trans-Andine Telegraph has reached Jujui, thus placing the northern portion of the Argentine Republic in communication with Chili.

THE Government of Honduras is endeavoring to have established a telegraphic line between Honduras and Salvador.

In consequence of the success of the trials, made on the line of telegraph from Berlin to Dresden, of a new kind of metallic posts, which are found to be so much more stable and durable as to compensate largely, in maintainance, for the greater prime cost, the Government has it in contemplation to provide all the lines with metallic telegraph posts.

THE Eastern Telegraph Company announce that the average actual time in the transmission of messages from Bombay, during the month of November, was one hour and thirty-seven minutes, which, by comparison with the return for October, is an improvement in speed of twenty-two minutes. An improvement of 1¼ hours has also occurred in the average speed from China.

THE Government of Spain has signed a concession to a Spanish company for a telegraph cable from Cadiz to Cuba, by way of the Canaries and Teneriffe.

QUEEN Victoria has nominated Chas. Todd, Esq., Postmaster-General and Superintendent of Telegraphs for the Colony of South Australia, a member of the Third Class or Companions of the Order of St. Michael and St. George.

PUTTING LIGHTNING IN A BOTTLE.

It may be mentioned that in one of Franklin's letters, written apparently before the year 1750, the points of resemblance between lightning and the spark obtained by friction from an electrical apparatus, are distinctly stated. It is but thirty years ago that Andrew Crosse, the famous amateur electrician, was asked by an elderly gentleman, who came to witness his experiments with two enormous Leyden jars, charged by means of wires stretched for miles among the forest trees near Taunton:

"Mr. Crosse, don't you think it rather impious to bottle the lightning?"

"Let me answer your question by asking another," said Crosse, laughing. "Don't you think it might be considered rather impious to bottle the rain-water?"—*All the Year Round.*

MILDE'S MARINE WATCH.—A new and useful application of electricity has just been developed by MM. Mildé & Co., of 5, Rue Bizet, Paris, whose electric clocks, it will be remembered, formed a prominent and interesting series of exhibits in the French Annexe at the late International Exhibition at South Kensington. M. Ch. Mildé has designed an electric marine chronometer for ships, which will possess many advantages over the ordinary chronometers. This electric horary apparatus will require no winding up, and will be unaffected by variations of temperature or the shock or motion of the vessel, or any other causes of perturbation; and can be arranged to indicate, by simple means, the true time in all parts of the vessel.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
January 15, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular.

GENERAL INFORMATION.

Half Rate messages should not be sent to offices whose square number is greater than 508, (*except squares* 509, 510, 511 *and* 587). Attention is called to instructions on page 6 of the Tariff Book.

Bethel, Conn., is now a W. Union office, square 37.

Aroma, Ill., changed to Waldron.

Otterbien, Ind., closed.

Crawford, Iowa, changed to Dawville.

The towns of New Chicago and Tioga, Kansas, have been consolidated under the name of Chaunte, Ks. All business for those points should be checked with Chaunte.

West Newton, Mass., closed.

Holbrook, Mass., closed.

Plympton, Mass., re-opened.

The notice in JOURNAL of November 15, relating to business for Campell's, should read, Campello.

Cunningham, Mo., re-opened.

No more business for the following Other Line Offices will hereafter be sent *via* Olean, N. Y.:

Arcade, N. Y.	South Wales, N. Y.
East Aurora, N. Y.	Yorkshire Centre, N. Y.
Elma, N. Y.	Franklinville, N. Y.
Holland, N. Y.	Ischua, N. Y.
Protection, N. Y.	Machias, N. Y.

Abbottsburg, N. C., closed.

Ava. O., re-opened.

East Sandy and Milton Farm, Pa., should read 25 and 2 more than Oil City, Pa., ck. Oil City, Pa.

City Farm, Pa., closed.

Riverton, Pa., closed.

Yeders, Pa., closed.

No more business for the following Other Line Offices in Pa. will hereafter be sent *via* Olean, N. Y.:

Eldred.	Port Alleghany.
Larabees.

OFFICES HAVING "SPECIAL SHEET A"

Will hereafter check West Troy, N. Y., same as "special rate to Troy, N. Y."

ATLANTIC CABLE BUSINESS.

We are officially notified that a new direct cable route is now open between England and Spain. Messages to go by this route must be addressed "*via* Bilbao," which words are not charged for beyond London. The rate from London is fixed at $2 for 20 words, half rate for every additional 10 or fraction of 10 words.

WILLIAM ORTON, President.

TRANSFER SERVICE.

EXECUTIVE OFFICE, NEW YORK,
Jan. 14, 1873.

On and after January 27th, *Dunbar, Pa.*, will be added to the list of money order offices in C. O. Rowe's district.

G. H. MUMFORD, *Vice-Pres't.*

EFFECTS OF THE LATE SLEET STORM—GENERAL DISARRANGEMENT OF WIRES.

On Sunday morning, 5th inst., a severe rain with high winds reached here from the south about ten o'clock, and before noon all the wires and poles were heavily coated with ice. This storm lasted only a few hours, but the results, in the destruction of wires and poles, are without parallel in this section of country.

At 11.45 A.M., several of the Pittsburg wires failed; at 12.40 P.M., N. Y., lost Albany on every wire, except one on the Hudson River R. R. The Erie Railway wires, save one working between 145 Broadway and the Grand Opera House, stopped working at 1.00; all the southern wires were grounded or open by 1.30; and at 3.45 the last Eastern wire stopped working. The City Line wires had broken some time previously. Information arrived of the complete wrecking of the Fire Alarm and Police Telegraphs, and that the police were forbidding passage through the public parks, on account of several persons being injured by falling limbs from trees ice-coated.

By half-past three twenty-two men were examining lines in all directions, to ascertain damage; most of them remaining out on duty through Sunday night.

Teams and extra men were got ready for an early start, and at six o'clock, Monday morning, poles, &c., were being distributed on the West street lines, which were badly damaged—eighteen poles having gone in one place, besides numerous single ones.

On the east side of the city it was found that the large poles, each carrying fourteen wires, mostly southern and eastern circuits, were broken: five poles on the corner of 1st Avenue and 23d Street, two large corner-poles at the junction of 39th Street and 2nd Avenue, with a large number of intermediate breaks.

The Western wires on the 8th Avenue poles were badly smashed near 90th Street, and at corner 8th Avenue and 125th Street, the large poles at the junction were gone, and wires tied to lamp-posts and trees by police.

The Eastern wires, running from the cupola of 145 Broadway, across the house-tops to Fulton street, were broken by two large poles corner of Church and Fulton streets, breaking off near the ground and resting against the windows of adjoining houses.

The house-top wires on the City Lines suffered severely. The wind had twisted the ice-covered wires in all sorts of shapes. Cross-arms were dragged down, and the ends driven through tin and board sheeting, large iron rods supporting the short poles, were pulled up or bent out of shape, &c. Most of the wires lying flat on roofs when not broken. Complete re-building of the house-top lines has been necessitated.

Superintendent Hinchman and Foreman Mackintosh were indefatigable in their exertions, and soon brought order out of the seeming chaos. In this they were assisted by foremen Raymond of Worcester, Cates of Boston, and McColiff, of New Haven, who arrived early on Tuesday with gangs of men. Many operators, also, became temporary inspectors and repairers. Miss Phebe Williams, operator at the Cable House, at the foot of 55th Street, deserves especial credit for the intelligence she displayed in making changes of wires, &c., by direction of the chief operator.

By Thursday morning all the wires in the city, with the exception of a few on house-tops—the repair of which were delayed from local causes—were again in good shape. Thirty-two new poles and over twenty-five miles of wire were required in repairing damages, and more than twelve hundred breaks were mended between the Battery and Harlem.

On the Jersey side the effect of the storm was fully as destructive. Gen. Supt. Eckert was early on hand at this point, and re-construction went on energetically. All the available force of repairers, between Philadelphia and Jersey City, were ordered to the latter point. On Sunday afternoon a special engine carrying repairers and material left New Brunswick for the scene of disaster, and at 4 A.M., of Monday a special train came from Trenton. This train stopped at every point where a break had occurred. In this manner over one hundred breaks were repaired before 8 o'clock, at which hour the train arrived at Jersey City.

Between the Cable House and the Jersey City Office, 150 poles were broken, some of them in two pieces. The weight of the ice which had accumulated upon the wires, and the force of the gale, was sufficient to snap poles 45 feet long, 18 inches thick at the butt, and all over 8 inches thick at the top, set six feet deep in the ground, like a pipe stem. Singularly, not a cross-arm was broken, nor a pin drawn out, and only in a few places were the wires broken; altogether, 165 miles of wire had to be re-constructed on the Jersey flats. Supt. Bates was early in the field, and ably seconded the General-Superintendent. 115 men were engaged from Sunday afternoon until Friday night, working early and late, until at last the wires of the Company were again in complete order.

The services of Messrs. Barr and Ricker, Managers of the Elizabeth and the Newark Depot offices, respectively, were of much value, and the labors of foreman Cooke, of Jersey City, McAleer of Philadelphia, and Hilton and Brown of the Erie R. R. District, conributed greatly to the final result.

For the first day or two after the storm, business for the South had to be taken to the Jersey City office for transmission. Eighteen wires were worked to Philadelphia and Washington—two of them with the Duplex system.

Great praise is due to all engaged in these arduous duties The company have reason to be satisfied with the energy, zeal and good-will displayed, while the public have had another opportunity to observe the efficiency of the company's service.

THE Cincinnati *Gazette* hits the vitals of the postal telegraph scheme when it says, "that the whole pretense of making the mail service a benevolence to the poor, and taxing the shirts on their backs, to make up the deficiency, is a fraud." Not more than one tax payer in a hundred uses the telegraph more than two or three times a year, or has any occasion to use it oftener. Yet it is proposed to tax all these in order to furnish cheap telegraphing to brokers, produce dealers, newspapers, merchants. and bankers, who have not petitioned for a postal telegraph.

ASSESSMENTS, 32, 33 & 34.
No. 495.

W. J. Holmes, Erie Railway Telegraph, New York, and W. J. Denver, Springfield, Mass., have been appointed Agents for the association in addition to those already named.

The treasurer has made a final settlement with the heirs of Andrew Ainsworth of Greencastle Ind., and Chas. E. Baker of Baltimore.

The former was in the employ of the Western Union Telegraph Co., and his family received the $100 paid by the company in addition to the proceeds of assessment No. 32, amounting in all to $1,070.60.

The heirs of the latter received $973,33 the proceeds of assessment 33.

We are pained to announce another death—that of Reuben S. Raymond for many years manager at New London, Conn. He died of Typhoid fever first ultimo after a lingering illness. Assessment notices covering his death will be issued in due time.

TERRIBLE EXPLOSION OF GAS IN THE CINCINNATI OFFICE. NARROW ESCAPE OF THE OPERATORS.

CINCINNATI, Ohio, Jan. 12, 1873.

At twenty minutes to eleven o'clock this evening a gas explosion occurred in the principal office of the Western Union Telegraph Company on Third street, in this city, heaving up the floor of the receiving room between the desks and windows, destroying the ceiling of the delivery room in the basement and blowing the plate glass windows in a thousand fragments. The panellings of the doors were torn out and portions of the cast iron mouldings forming the base of the column at the street door were hurled into the street, striking a messenger boy on the leg, but inflicting only slight injury. The windows in the bank opposite were badly cracked. About a dozen operators, at work on the fourth floor, rushed through the darkness to the street in safety, but subsequently returned to work. There were five persons in the room where the explosion occurred, and they fortunately escaped uninjured.

TREASURE TROVE.—The shares of the Nova Scotia Electric Telegraph Company had been for years of so uncertain a value that they were scarcely quotable. A gentleman some years ago gave away several shares to parties who wished to have a vote at the Board on a particular occasion, but did not feel disposed to pay more than a few shillings for the privilege. But since the sale to the Western Union stock has gone up, it is announced that the company are prepared to pay the stockholders $25 per share. This is an advance of twenty-five per cent. on the par value, and of as much as fifty per cent. on the cost of the shares to many of the present holders.—*Halifax Recorder, Jan.* 9.

ABOUT SUBMARINE CABLES.

Our readers are indebted to Mr. L. G. Tillotson, of the firm of L. G. Tillotson & Co., for the following extracts from a letter received by him from a friend in London. The general interest manifested in submarine cables at this day, serves to render the information contained in this communication of much value.

"Amongst the items of the greatest interest now agitating our telegraphic minds, the principal are the several Atlantic Cables and the communication with Australia by the new Overland line and also the completion of the West Indian Cables. As most of the negotiations and all the work in connection with the Atlantic Cable is being carried out on our side of the water, we may be naturally supposed to know a trifle more of the subject than is known on your side.

"The high price of Atlantic telegrams rendered sending messages quite a luxury, which was embraced by a very limited few, who in consequence of their business, used it largely; the general public sent a message only now and then, and then then did not like it, but they could not help it. However, the breakage of the two Atlantic and the supposed faultiness of the French Atlantic Cable, made people somewhat anxious about a total breakdown, so several schemes were at once on foot to lay what were termed *direct* cables, and to introduce a lower tariff.

"The first scheme was brought out privately by an eminent city firm, and the contract was immediately taken by the Telegraph Construction and Maintenance Company. However, the French Atlantic Company did not appear to admire this opposition, although strangely enough the scheme was offered to them in the first place to take up, and so after many *pros* and *cons*, arrangements were made by which they were to become the owners of the cable. A fresh issue of capital was the result, and the manufacture of the cable is steadily progressing.

"This cable will certainly be more direct than the three existing cables. It will start at a point near the Land's End, and from thence cross in as direct a line as possible to Halifax, from thence a cable will be laid to Long Island, and from Long Island to New York by cable and by underground line.

"The lengths will be

Land's End to Halifax, .	2896 nautical miles.
Halifax to New York, . .	720 " "
Total,	3616 nautical miles.

"Of this total, about 43 miles will be a well insulated underground line, about 3 miles on this side and the remainder on Long Island and to New York. The main stretch of cable is larger than any existing span, but it is hoped, that with the improvements in the manufacture, the speed of the cable will not be much less than that of the present French Atlantic, which is shorter by 300 nautical miles.

"The core is very heavy and equal in weight to the present French Atlantic, it consists of 400 lbs of seven wire copper strand insulated with 400 lbs of gutta-percha and compressed in four alternate coatings There is, however, a great difference in the gutta-percha used, in the existing cable the material is of the best kind usually employed in insulating sub-marine cables, possessing however, an inductive capacity of about 20 per cent. higher than india-rubber.

"In the present cable, the quantities as to weight are precisely the same as in the first French Atlantic Cable, but the use of the improved material at once reduces the capacity of the cable and will give an increased speed, taking the lengths as the same, but as the length will be now greater, this disadvantage will be equalized by the reduction in the inductive capacity.

This is undoubtedly a great step in advance in the construction of long submarine cables. The core for the slender section between Halifax and New York is 107 lbs. of copper and 140 lbs. of gutta percha.

As the varying depth of water necessitates a different type of cable, these are to be of the following lengths:

Shore-ends . . .	68 miles.
Intermediate . . .	853 "
Deep Sea . . .	2,652 "
Land lines . . .	43 "
	3,616 miles.

There is nothing particular to call attention to in these types of cable, except in the deep sea. This is of the usual Atlantic pattern, with an important addition. The sheathing consists of *ten* strands of wire and hemp, each strand being formed of a galvanized homogeneous iron wire, .099 inch diameter, to bear the breaking strain of 53 tons per square inch, and covered with five yarns of St. Petersburg or Manilla hemp; the cable thus sheathed, is protected with a light whipping of yarn sewed in the opposite direction, and then passed through a bath of silicated compound. In the original Atlantic cable the whipping was omitted.

The manufacture is progressing so rapidly that the contractors are looking out for something else to do. Over 2,000 miles of the various types have been made, and of this about 1,200 shipped on board the Great Eastern.

The other scheme, to which I referred, is that known as the Great Western; this was brought out independently. The proposed route of this cable is entirely new. The cable will start from a convenient point near the Land's End to the Island or Bermuda, and from thence to New York. From Bermuda, a cable will in the course of time be laid to St. Thomas, to connect with the network of the West Indian cable; subsequently it is proposed to lay another cable from Bermuda to the coast of South America, so as to embrace a still larger field of telegraphy.

The length required for this work is nearly 5,000 miles, the largest contract in Submarine Telegraphy yet undertaken. The length of the sections and the types of the cable are:

Section 1.—Land's End to Bermuda:

	Knots.	
Main Cable	2,990,	
Intermediate	210,	
Shore Ends	25,	
		3,225 knots.

Section 2—Bermuda to New York:

Main Cable.	642,	
Intermediate	40,	
Shore Ends	80,	
		762 knots.

Section 3.—Bermuda to St. Thomas:

Main Cable	931,	
Intermediate	15,	
Shore Ends	20,	
		966 knots.
		4,053 knots.

Whilst there is very little difference in the lengths of the short sections of the French and the Great Western Cable, there will be found in the main section of the latter an increased of 329 knots, which will make most material difference in the speed of working.

The insulation of this cable is materially different from the one just described, and also from the present existing Atlantic Cable. The conductor is insulated with that peculiar combination of India rubber, known as Hooper's Core. There have been many doubts about this material. It has been used largely, sometimes with unqualified success; at others with anything but success. There are plenty of advocates for it, and, probably, equally as many against it.

This cable will be the first *long deep* sea cable where this material has been used; and if the result is as successful as anticipated, gutta percha will have, at length, met its rival.

The core for the Great Western Cable consists of a stranded conductor *tinned* (copper and vulcanized rubber don't quite agree telegraphically, although chemically they have a close affection for each other), each wire is tinned, and the total weight per nautical mile amounts to 300 pounds, whilst the insulating material amounts to 250 pounds per mile. The insulating material consists of pure rubber next the *tinned* wire, then a separate next vulcanized rubber, and finally a jacket. The process is peculiar, but the result may be stated that it produces an insulator of the highest type; its difficulty is that in that length the insulation is so high that it can hardly be measured, and very special electrical tests have to be arranged to get any test at all. In fact, as an insulator, it is perfect and far too good. Fancy 3,500,000,000 ohms per mile at 75°!

In the external protection of the cable there is nothing which calls for any particular remark. The elasticity of the main deep sea cable is of a similar character to the duplicate French Atlantic. The manufacture of the cable is progressing satisfactorily, but the question of shipment being unsettled, no ships have as yet been engaged, although there is no talk of a big ship being needed; however, things, it may be supposed will settle themselves quietly in due course.

MARRIED.

HURLBUT—BABER.—In Skaneateles, N. Y., Dec. 31, 1872, by Rev. Dr. Hudson, O. W. Hurlbut, Manager W. U. Tel. office, Manchester, Iowa, to Miss Eliza Baber, of Skaneateles.

RHOADS—McGOWN.—At Urbana, Ohio, Jan. 1, 1873, at the residence of the bride's mother, James H. Rhoads, Manager W. U. Tel. office, Bellefontaine, O., to Miss Maria Mc Gown, daughter of the late John B. McGown.

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, JANUARY 15, 1873.

ARTICLE THIRD ON THE POSTMASTER-GENERAL'S REPORT.

The following appeared as an editorial in the *Daily National Republican* of January 1, 1873 :

In the *Journal of Telegraph*, the official organ of the Western Union Telegraph Company, of the 15th instant, is a long criticism on the report of the Postmaster General, complaining of the gross inaccuracies into which he has been led. Among others, the Postmaster-General says the telegraph in this country collects an average of 70 cents on each message. The *Journal* makes the average 62 cents, an apparent error of 8 cents. It is very easy to show how these different results are obtained, and which party is guilty of inaccuracy.

Mr. Orton, the President of the Western Union Telegraph Company, gave the Postmaster-General some statistics of the business of that company for the year ending July 1, 1872. Among them, receipts for transmission of messages, $7,040,803.53 ; transmission of press reports, $979,083.71 ; transmission of market reports, $107,579.72 ; transmission of weather reports, $137,522.88 ; from all other sources, $192,705.93. Total, $8,457,095.77.

One other source is partly premium on gold from cable and other telegrams. There were sent paid messages, 10,271,935 ; D. H. messages, 660,203 ; Press messages, 1,512,561. Total of all kinds of messages, 12,444,499. Now, if our authority is correct —if the item relating to press messages is deducted from both sides of the account—there will remain 10,271,935 paid messages, for which there were collected $7,478,012.06, equal to an average of 72 8-10 cents per message, showing an underestimate on the part of the Postmaster General.

The official organ of the Western Union Telegraph Company obtains its estimates by deducting from "the receipts for the transmission of messages, $7,040,803.53," certain "disbursements," $220,395.75; leaving a balance of $6,820,407.78. Omitting all receipts for messages for weather and market reports, and adding to the paid messages, 10,271,935, the dead-head messages, 660,203 ; making a balance of 10,932,138 ; and thus obtains the result of 62 cents, *forcing* the average by deducting from the receipts and adding to the number of messages.

We submit that such criticism is hardly becoming a corporation to which are entrusted the secrets of its customers, and must greatly weaken the credibility of any other statements it may make.

In October last, the President of the Western Union Telegraph Company, at the request of the Postmaster-General, furnished the following statement of the operation of the company during the fiscal year ending June 30, 1872.

MESSAGES.

Number of paid messages sent during the year	10,271,935
Partially paid and free messages	660,203
Press messages	1,512,361
Total number of messages	12,444,499

RECEIPTS.

For transmission of messages	$7,040,803 53
For transmission of press reports	979,083 71
For transmission of market reports	107,579 72
For transmission of weather reports	137,522 88
From all other sources	192,105 93
Total receipts	$8,457,095 77

DISBURSEMENTS.

Paid other lines	$160,514 74
Refunded and uncollectable	59,881 01
Salaries	3,058,363 22
Messengers	293,908 30
Printing and Stationery	166,196 24
Rent, light and fuel	328,999 48
Office furniture, fixtures and repairing	116,345 62
Instruments and battery	240,991 02
Claims for damages and law expenses	41,530 68
Taxes	45,445 21
Repair and maintenance of lines	930,005 17
Rent of lines leased	150,082 42
Miscellaneous	74,600 05
	$5,666,863 16

It is probable that the receipts for press reports were slightly in excess of the amount stated, as the separation is made during the month by re-inspection of the messages, and some press messages may be overlooked.

The receipts for market reports are not paid by the press.

Those "from other sources," include premium on gold received from tolls accruing to the company on cable business, subsidies, commissions on money transfers, and dividends on stock held by the company.

The disbursement for messenger service is almost entirely for salaries, and the amount paid for repair and maintenance of lines, includes the salaries of the repairers.

In the above list of disbursements, are two items covering the amounts paid other lines, and refunded and uncollectible, amounting to $220,395.75, which amount is, of course, properly deductible from the receipts, thus leaving the actual receipts for the transmission of messages, exclusive of press and weather reports, $6,820,407.78. No estimate nor account was made of the number of weather report messages transmitted. The number of press messages, was stated in the letter to the Postmaster-General, as an estimate made by dividing the number of words sent for the press, by 30, which was taken as about the average number of words in ordinary commercial and social messages. The number of messages stated, does not include messages sent by or for railroad companies between stations on the line of the roads, nor service messages of the telegraph company.

Excluding from the account, both the estimated number of messages sent for the press and the receipts therefor, the account will stand thus : Number of messages sent, exclusive of press and weather reports, 10,932,138. Receipts for transmission of messages, $6,820,407, showing the average rate per message, 62 cents. If either class of these messages were included in the estimate, they would necessarily reduce the average rate received.

We have not imputed to the Postmaster-General any improper motives in the presentation to Congress of his inaccurate statements in relation to the telegraph, nor do we accuse the *Republican* of any disposition to intentionally misrepresent the facts in regard to the traffic of the Western Union Company. We presume that they are both honestly mistaken, and we shall take pleasure in setting them right. Our aim is simply to state accurately all the facts in the case, and if in so doing we are compelled to show gross errors in the statements of the Postmaster-General, or of his assistants and defenders, we do not thereby necessarily impeach their motives.

The method adopted by the *Republican* for increasing the average rate charged by the Western Union Company for the transmission of messages, is to deduct from the number of messages sent the 660,203 "partially paid and free messages," and to add to the receipts for the transmission of messages the revenue derived from market and weather reports, from refunded and uncollectible messages, from business taken in for other lines and paid over to them, from premiums on gold, dividends on stock owned by the company, and from other sources, and then divide these aggregate receipts by the diminished number of messages.

The only fault we can find with this method of arriving at a desired result is, *that it has no true basis in the essential element of fact.* The 660,203 partially paid and free messages were not all "dead-heads," as assumed in the *Republican's* calculations, *but were paid for at an average compensation, in cash, considerably greater than that derived by the company for the transmission of the Governmental weather reports.* The receipts for this class of messages were included in the receipts for the transmission of messages, so that there is no reason for excluding them from the number of messages sent in arriving at the average rate charged.

The propriety of excluding from the receipts for the transmission of messages the amount of charges on uncollectible and refunded messages, as well as the sum paid to other lines, it seems scarcely worth while to discuss, since the first amount never came into the treasury at all, and the last was only received by the company as agents for other lines, to whom it was paid over. We scarcely think that the *Republican* would include among its legitimate receipts the moneys paid to it as subscriptions for other papers for which it might act as agent.

The question whether the premium on gold, remaining in the company's hands after settling with the Cable Companies, should be regarded as forming a portion of the "receipts for the transmission of messages," might, perhaps, be open to discussion, but, as the amount would only make a difference of a fraction of a cent in the average rate, it is scarcely worth considering. The dividends on stock owned by the company cannot, however, in any way, be

Digitized by Google

construed into receipts for the transmission of messages. The market reports were not counted as messages, but like the press reports, were counted out of the dividend as well as the divisor. If the market reports were counted as messages, they would greatly reduce the average rate, because the reports are delivered to a large number of subscribers, who pay for them a gross sum per week, irrespective of their number or length.

This brings us to the last item of misconception on the part of the *Republican*, namely, the weather reports. As we expressly stated that no account was made of the number of weather report messages sent, there does not appear to be any reason why the receipts for this business should have been included in the *Republican's* sum of receipts for the transmission of messages, to be divided by the number of messages sent for ascertaining the average rate of tolls. The $137,522.28 represents the gross sum paid by the Government for performing the weather report business from November 1, 1870, to June 30, 1872—a period of twenty months—and could not, therefore, form any part of the dividend for which the messages sent during the fiscal year ending June 30, 1872, made the divisor, for determining the average rate of tolls. We are very glad, however, to have our attention called to the weather reports, as it will afford us an opportunity to show the *extreme liberality* of the Postmaster-General toward the company in fixing the rate for this business, and because there can be no doubt about the average tolls received by the company for performing it.

From November 1, 1870, to January 1, 1872, the company received as compensation for the transmission of these weather reports, two cents per word for each circuit, irrespective of length, with no compensation for drops, office messages, or other services or special facilities. The circuits varied in length from 250 to 2,500 miles; that from Chicago to San Francisco being the longest. The weather reports consisted of three cipher messages from each signal station, sent daily at 7.45 A. M., 4.45 P. M., and 11.45 P. M., Washington time. The morning report contained 20 words, and the afternoon and midnight reports, 12 words each. The tolls were therefore 24 cents for the afternoon and midnight, and 40 cents for the morning reports. In a great many instances the offices from which the reports were sent, were not kept open for ordinary business after 9 o'clock P. M., and the operators were obliged to come to the office at midnight to send the weather reports. On the Pacific coast, owing to the difference in time, the operators were compelled to get up at 3 o'clock in the morning to send them.

The three daily reports from each station, contained an aggregate of 44 words, and at two cents per word for each circuit, amounted to 88 cents, or about 29 cents per report. The average length of each circuit, over which these weather report messages were sent, at an average rate of 29 cents, was 629 miles.*

*See statement of Chief Signal Officer, page 92, Report No. 99, House of Representatives, May, 9, 1872.

The 29 cents per message, however, covered a good deal more than the transmission of such message from 250 to 2,500 miles. This sum of 29 cents was not only to be taken by the company, in full payment for the transmission of such messages, but no additional allowance was to be made for drops, office messages, or other services or special facilities required by the chief signal officer.

Let us consider what the company performed for the signal office, besides sending the message, for which it could only receive 29 cents. Three times in every twenty-four hours, the following circuits had to be made up and placed at the disposal of the weather report business:

Circuit Limits.	*Distance in air line. Miles.*
Portland to New York,	339
Mount Washington to Boston,	200
Burlington to Boston,	234
Knoxville to Washington,	512
Lake City to New York,	1,123
Augusta to New Orleans,	674
Milwaukee to New York,	1,047
Detroit to Grand Haven,	189
Pittsburgh to Chicago,	468
New Orleans to Chicago,	913
Cairo to Chicago,	365
Leavenworth to Saint Louis,	312
Galveston to New Orleans,	306
San Francisco to Chicago,	2,349
Chicago to Keokuk,	245
New Orleans to Shreveport,	396
San Francisco to Portland, Oregon,	797
San Francisco to San Diego,	517
Cheyenne to Santa Fé,	543
Corinne to Fort Benton,	622

Now, the message had not only to be sent over one of the above circuits for 29 cents, but it had also to be dropped at every intermediate signal station without any additional compensation. Upon the New York and Lake City circuit, each message was required to be dropped at Cape May, Philadelphia, Baltimore, Washington, Norfolk, Wilmington, Charleston, Augusta, Savannah and Lake City—making ten copies of the reports which had to be written off and delivered by the company for 29 cents—or counting each copy as a message, about 3 cents per message. But this is not all that had to be done to earn the average toll of 29 cents.* The company was to provide all other services or special facilities required by the chief signal officer, without *additional allowance.*

In addition to the occupation of the above described important circuits, extending throughout the United States, for the transmission of the weather reports, the chief signal officer represented that it was necessary that he should have at his disposal special circuits between Washington and New York, Washington and Chicago, and Washington and New Orleans. These circuits were required to be connected with the Signal Office at 7.45 A. M., 4.45 P. M., and 11.45 P. M., daily, and at such other times as the signal officer should call for them.

* Since January 1, 1872, the Signal Service reports have consisted of three daily messages from each signal office, and the rates have been increased to three cents per word, making the average rate 30 cents per message.

The connection with the signal office was made by the construction of special lines by the Western Union Company, for which they received no *additional allowance.*

Under the claim of the right to send office messages, and to receive other services or special facilities from the company, without additional allowance, the signal office took possession of the special circuits for purposes of display, as well as for the obtaining of trivial information, such as the hours for the departure of trains, the hiring of operators, the procurement of vaccine matter for the prevention of small pox, etc., etc., during the most crowded hours of the day, when they were most useful to the public, and, therefore, most valuable to the company.

Probably the above statement, relating to the signal service business, will satisfy the *Republican* that we did not leave the signal service messages out of our exhibit, because the price paid for their transmission would have increased the average rate; but we fear that it may cause that journal to doubt the justness of the rate of compensation *allowed* by the Postmaster-General for their transmission, and which the President of the Western Union Company maintained and proved before the Committee on Appropriations was totally inadequate. Indeed, the fact that this preposterously low rate was accepted by the Company for performing the signal service business, was taken advantage of by Mr. Hubbard, in the recent report in favor of his job, presented by Mr. Palmer, of the Appropriation Committee, to prove that the Company's tolls were too high!

While the authority of the Postmaster-General to fix the telegraphic charges for Government messages, under the Act of 1866, was not denied, the Company did not admit the right of that officer to control its wires, to direct when and how circuits should be made up, to dictate the routes by which messages should be sent to their destination, to order its operators to open their offices at unusual and inconvenient hours in the morning, and to keep them open at night until the permission of some other Government official to close them had been obtained. Nor was it willing that the most important circuits in the country should be seized upon at any moment by the signal office for the gratification of a momentary whim, and notice was therefore given that the signal office's control of the wires of this Company would cease on the 30th of June, 1872. Since then, the weather report business has been mainly performed by other Companies, very much to the relief of the Western Union Company; and the views of the former, as to the Postmaster-General's rate of compensation, may be inferred from the testimony of Mr. Thurston, President of the Pacific and Atlantic Telegraph Company, before the Committee on Appropriations, December 17th, 1872.

The CHAIRMAN.—Has the question ever been raised in your company as to the right of the United States under the Act of 1866? Have you ever contested it with the Government or denied it in any way?

Digitized by Google

Mr. THURSTON.—No, sir. We do not pretend to contest it or deny it under our acceptance of that Act.

The CHAIRMAN.—Have you ever refused to send any message for the Government?

Mr. THURSTON.—No, sir. *We have protested against the compensation, and my protest is now on file in the signal office, showing distinctly that we are doing the work at one half its cost to the company.* I propose at the proper time to make application to the proper authorities for recompense for the money that we have lost in doing the service for the Government. I stated the matter very fully in my protest on file in the signal office.

The CHAIRMAN.—When?

Mr. THURSTON.—Some time last Summer.

The CHAIRMAN.—Does the mode adopted by the signal office of sending its messages interfere with your business any more than any other ordinary form of messages?

Mr. THURSTON.—Yes.

The CHAIRMAN.—In what way?

MR. THURSTON.—We have certain hours at which signal messages are supposed to be handed us, at which time we are expected to transmit them without delay, giving them preference over all other business. Until those messages are handed in we cannot fully handle our wires, nor undertake to send long messages, because we would have to interrupt them when the signal messages come in. The result is that the wires lie comparatively idle, waiting for the signal messages. Of course there are a few messages sent in the meantime in regard to handling the wires, or such office business as is needed; but, effectually and practically, the wires are at the service of the United States for one hour's time. When that hour expires the orders are to go on with the regular business of the office; but during that hour's time the wires are kept virtually at the service of the signal office.

The CHAIRMAN.—Is the peculiar arrangement of circuits and dropping messages a matter of disadvantage to you?

Mr. THURSTON.—Yes, sir.

The CHAIRMAN—In what way?

Mr. THURSTON.—The circuits are purely arbitrary and are not circuits of the Company. The signal service makes our circuit for us from New Orleans to Cincinnati, whether our Superintendent makes it so or not, and we must send its messages over all the circuit; then the messages have to be dropped, and for these drops we get no compensation. For instance, we send a regular commercial message from Cincinnati to New Orleans, and we receive for it $1.50; the signal service sends its messages between the same points, and we receive for it only 30 cents—but that message is also dropped at Louisville, Nashville and Memphis. There are one, two, three, four messages delivered for 30 cents. But the signal service says: "No, this goes the whole length of the wire; it is "heard at each office as it passes through; it goes "through those offices anyway, and the dropping of "it is no extra expense to the company." If that message which goes from Cincinnati to New Orleans was sent primarily from Cincinnati to Louisville, it would be a message, and would be paid for at the rate of 30 cents; the manipulation in sending it from Cincinnati would be the same, and the labor of receiving it at Louisville would be precisely the same. But the signal service says that it is no trouble to have the message dropped at Louisville, and yet the operator has to be on hand there, and has to go through the same manipulations in receiving that dropped message as if it had been sent primarily, and only from Cincinnati to Louisville. The result is that a signal service message sent from Cincinnati to New Orleans employs four officers, and requires the same services to be performed as four commercial messages would require, and yet the signal service pays for only one message, and pays for that only 20 per cent. of that which a commercial message would pay.

THE CHAIRMAN.—The operators would be at the intermediate offices anyhow, would they not?

Mr. THURSTON.—They might not be. It is not likely that some of them would be at their offices at 12 o'clock at night. It would not be necessary.

Having thus presented the leading facts in the case in a fair and candid spirit, we trust that the *Republican* will, in justice to us, to its readers, and to itself, reproduce this article wholly or substantially.

WE take great pleasure in acknowledging the receipt of a letter from Superintendent Flanery, of New Orleans, enclosing check for subscriptions; and still more for the very complimentary manner in which he alludes to the great improvements in the JOURNAL, and especially to its notable feature, the illustrated electrical apparatus, which, he justly says, should make it invaluable to young and old. The arduous duties incident to the production of a paper containing accurate and valuable information upon all subjects pertaining to the great field of electrical science and practical telegraphy, are fully compensated by words of commendation spontaneously offered by men of such sterling ability and acquirements as Mr. Flanery.

ELECTRIC RAILROAD SIGNALS.

The advertisement of the Electric Railroad Signal Company, cautioning officers of railroads and others interested against infringers upon the Patents held by that company for Electric Railroad Signals, will be found of interest to the parties concerned.

THE new advertisement in this issue of the JOURNAL, of Messrs. Partrick, Bunnell & Co., is worthy of the attention of all telegraphic managers.

With greatly enlarged and perfected manufacturing facilities, they offer a most complete line of instruments and supplies, covering every possible requirement of telegraphic maintenance.

As these gentlemen are extensively known as being thoroughly practical telegraphers, there is good reason to believe that their telegraphic manufactures will be found fully up to the highest standard of excellence in every respect. Their friends, who are numerous throughout the United States, will be pleased to note their progress.

ANNUAL SUPPER OF THE CINCINNATI TELEGRAPHERS.

A very cordial and happy state of feeling between the Adams Express Company at Cincinnati and the telegraphers of that city has existed for a long time past. This pleasant feeling culminates yearly in a supper, at which the part of hosts are maintained by the Express men. Last month the supper came off on the 21st, all telegraphers who were fortunate enough to be off duty being in attendance. Invitations were printed in telegraphic characters, and the order of toasts, &c., appeared in a highly ornamental manner. The banquet hall at the St. Charles Hotel was handsomely decorated with evergreens and flags, and a fine band discoursed good music. At eight o'clock in the evening a procession was formed from the Western Union Telegraph office, and, headed by the committee, marched to the hotel. Mr. Weir, of the Express Company, presided. Speeches were made by Mr. Weir, Mr. Speed, Supt. of the Pacific and Atlantic line; Mr. Williams, Supt. of the Western Union Co.; Mr. Armstrong, Manager of the Western Union Co.; chief operators Johnson and Mattoon, Mr. Selden and others. Had we space we would gladly give our readers the speeches, more particularly those of Messrs. Mattoon and Selden, which were in a very happy vein and abounded in local allusions. The party broke up at a late hour.

NEW TELEGRAPH INSTRUMENTS.

The advertisement of F. L. POPE & Co., in our columns, will be of interest to managers of telegraph lines and others who desire to purchase telegraph instruments and supplies. This firm are now prepared to fill any orders that may be entrusted to them with promptness. Their new RELAYS, SOUNDERS and KEYS are newly designed by Mr. F. L. POPE, and scientifically adapted to the service required. They are very handsome instruments.

ANNUAL MEETING OF THE INTERNATIONAL OCEAN TELEGRAPH COMPANY.

The annual meeting of the International Ocean Telegraph Company was held at the office of the company in this city, on Friday, December 27th, and the following gentlemen elected directors of the company for the ensuing year:

Messrs. Henry K. Bull, M. L. Delafield, D. H. Haight, A. Hamilton, Jr., Charles Knapp, Robert L. Livingston, James T. Sandford, Wm. F. Smith, E. S. Sandford.

At a meeting of the new Board on the following day, Gen'l Wm. F. Smith was elected President; A. Hamilton, Jr., Vice-President; M. L. Delafield, Secretary; and Theo. P. Bladen, Treasurer.

GEO. A. GUSTIN, ESQ., for the past five years chief operator in the Augusta, Ga., office, of the Western Union Telegraph Company, has been appointed stenographer and private secretary to the Postmaster-General.

GEO. C. MAYNARD having resigned the position of Electrician, U. S. Signal Office, James A. Swift, for a long time Operator in the Western Union Washington Office, and for the past two years Operator at the Signal Office, has been appointed in his place.

THERE are, at present, three submarine telegraph cables between America and Europe. A new cable is soon to be laid by the French company, and still another by the Great Western Telegraph Company, making five in all. The total amount invested in all these cables will be thirty millions of dollars.

RE-ORGANIZATION OF THE SOUTHERN DIVISION.

General Superintendent Jno. Van Horne has re-organized his Division, dividing it into seven Districts, and the changes have been approved by the President.

It will stand as follows:

1st District. { J. R. Dowell, Sup't, Richmond, Va.
J. W. Kates, Ass't Sup't, Richmond, Va.

2d District. { J. B. Tree, Sup't, Louisville, Ky.
Geo. W. Trabue, Ass't Sup't, Nashville, Tenn.

3d District—J. A. Brenner, Sup't, Augusta, Ga.

4th District—C. G. Meriwether, Sup't, Mobile, Ala.

5th District. { D. Flanery, Sup't. New Orleans, La.
James Compton, Ass't Sup't, Jackson, Miss.

6th District. { L. C. Baker, Sup't, Little Rock, Ark.
Wm. A. L'Hommedieu, Ass't Sup't, Monroe, La.

7th District—D. P. Shepherd, Sup't, Houston, Texas.

The Superintendents will have charge of all office accounts, make all reports to the Auditor, and all requisitions for funds.

The Assistant Superintendents will take charge of construction, reconstruction, ordinary repairs, circuits, electrical matters, and railway relations.

Foremen and local repairers will be under the control of and report to the Assistant Superintendents, and draw their pay from them.

The Assistant Suprrintendents will make no requisitions on the Treasurer for funds, but draw their money through the Superintendents of their respective Districts.

INSULATION TEST OF WIRES IN THE SEVENTH DISTRICT, CENTRAL DIVISION, MADE AT CINCINNATI, OHIO.

	Tested with.	*Miles.*	*Mileage Resistance in Ohms.*	*Gauge of Wire.*
A..	Columbus..	122	15.	No. 8, new wire galvanized.
B..	"	130	18.2	25 miles old No. 6, plain; remainder No. 9 galvanized.
C..	"	130	16.	No. 9 galvanized, in use 2 years.
D..	"	122	18.2	66 miles No. 9, galvanized; remainder No. 6 plain, very old.
E..	"	122	15.8	24 miles No. 8 galvanized; remainder No. 9 galvanized, nearly new.
D..	Pittsburg..	315	17.9	66 miles No. 9 galvanized; 56 miles No. 6 plain, very old; remainder No. 9 galvanized, nearly new.
E..	"	322	17.3	24 miles No. 8 galvanized; remainder No. 9 galvanized, nearly new.
F..	Grafton....	309	14.5	212 miles No. 8, remainder No. 9, all new galvanized.
G..	St. Louis..	341	16.2	No. 9 galvanized, in use 11 years.
H..	"	330	16.7	No. 9 galvanized, in use 12 years.
I...	Louisville..	140	16.9	12 miles No. 9 galvanized; remainder No. 8, all new.
J..	"	109	13.8	No. 8 galvanized, new.
K..	Chicago....	294	17.	Few miles No. 9, remainder No. 8, all new galvanized.
A..	Cleveland..	295	17.	122 miles No. 8, new; remainder No. 9. 143 miles of which is very old, all galvanized.

These tests were made in clear, cold weather, no escape.

GOOD WORK AT INDIANAPOLIS.

The President's message was received at the Indianapolis Ind., office, upon two wires, between the hours of 2.15 and 6.30 P. M. It contained over 11,300 words, and was taken without a break. The spokesman of Indianapolis office wants to know "can you get ahead of that." We cannot.

PRESENTATION TO MISS ANNIE RICHARDS.

A number of the citizens of Skaneateles, N. Y., on New Year's day, presented Miss Annie Richards, manager of the Western Union Telegraph Office, with an elegant camp chair. That present came from the right quarter. Miss Richards is to be congratulated upon her popularity with the customers of the company.

PRESENTATION TO MR. L. A. LOUIS.

Mr. L. A. Louis, Superintendent of the Telegraph for the I. C. R. R., was presented with a handsome gold headed cane on Christmas eve, by the Telegraph employees on that road. The local papers say that the caning he then received served him right. That is our opinion likewise.

PRESENTATION TO MR. S. L. GILSON.

Yesterday afternoon Mr. S. L. Gilson, Manager of the Western Union Telegraph Company, was made the recipient of a handsome testimonial from his operators and attaches of the company. At the hour of five P. M. Mr. Gilson was conducted to the spacious operating room of the company, where the "telegraphic friends" had assembled. On behalf of the donors, Mr. J. B. Bryant, in a neat speech, presented to Mr. Gilson, as a token of the high regard with which he was held by his professional brethren, a handsome and elaborate service of silver. Mr. Gilson, taken by surprise, replied in a few brief and well-timed remarks, cordially thanking the donors for their testimonial of esteem. The central piece of the silver set bore the following inscription: "Presented to S. L. Gilson by his telegraphic friends of Pittsburgh—New Year, 1873." The remaining pieces of the set bore the monogram "G." The gift is a deserved tribute to one of the many courteous and deserving officers of the Western Union Telegraph Company.—*Pittsburgh Post, Jan.* 1.

MODERN CONVENIENCE.

The establishment of private telegraphs all over our large cities is beginning to be one of the notable features of our material progress. Here again physical science is supplemented by that economic ingenuity which organizes and systematizes our daily life through co-operation and division of labor. Any one may *own* a private telegraph who chooses, but he may *hire* one just as well. Companies established for the purpose will stretch his wires for him, set up his batteries, and "coach" him in the few simple, practical methods of signaling required, into the bargain. For all this they will charge him a sum, which, in view of the convenience attained, is almost insignificant, and on any change of residence or place of business will patiently pick up their machinery, and set it all up again before the wandering client is fairly settled in his new abiding-place. Thus the merchant may be in immediate communication with his counting-room, and close bargains or make consignments from his library fire; or, from down town may talk familiarly with madame and the little ones about the afternoon drive or the evening's entertainment. The lawyer may know at his office just what is going on in court, and the politician, with his finger on the magic key, may make his busy brain felt in a dozen different places at once. The manufacturer may watch from his central point of observation the ramifications of his immense industry, directing its momentary and minutest details as if personally on hand. Sitting with an editorial friend the other day, whom late work and a headache had kept up town, we were amused and interested to see him step to his dressing-table, and, with a little buzzing and clicking of wheel-work, and a few mystic waverings of a ghostly index, inform "the office" that he should be down town at 2 P. M., to which the office responded with a cheerful but laconic O. K. As we had been told at the office an hour or two before that the luxurious journalist had just telegraphed to have his mails sent up, we were profoundly impressed with the coziness of the whole arrangement. And behold! we, too, have become a sharer in the blessing. Having, a few evenings ago, to send a message and parcel down town at a late hour of the evening, one touch of a little key at the office of the nearest hotel brought in three minutes a blue-coated, wide-awake little lad from the messenger office in Twentieth street at full gallop, and our parcel was on its way down town in less time than would have been needed to don the journalistic coat or draw on the editorial boots. The whole operation cost less than fifty cents! The same company expect soon to have the city partitioned out with districts and district offices, in such sort that a private family may communicate their wants, and call for messengers, police officers, fire service, and the like, in a very few minutes at furthest. Thus Bridget need not leave her steak spoiling at the kitchen fire while she runs for the doctor, and, as the circular roguishly suggests, the timid householder in process of being "burgled" may call down a squad of policemen on the artistic cracksman, who is working away at his area window in all the security of conscious well-doing.

Such improvements are welcome, not merely because they make life more sensuously comfortable and easy, but because they help to make it more effective. The province of society is to offer to mind the freest play and influence over matter, and everything which helps us to throw off the needless vexations and hampering limitations of time and space, gets the world forward, not merely in seeming but in fact. The future of this curious application of a familiar principle seems incalculable. It may not be many years before the housetops over our heads, the very steeples and flagpoles and trees shall be lit and tangled in an interlacing net-work of wires, over which the thoughts and plans, desires and passions of our crowded population shall go swarming and tingling with pulsation as constant as that of our lungs or our hearts—crossing, intersecting and blending, a fit emblem in their silent activity of the more evident strife and bustle, trial and work and suffering below.—*Scribner's for December.*

HOW TO PREVENT "TAPPING THE WIRES."

A SAGE BRUSH EDITOR BADLY HOAXED.

The following is clipped from the Gold Hill (Nevada) *News* of November 8, 1872:

"Instances have occurred, as is well known, of telegraph messages [illegible] isolated stations being stolen, not only by the surreptitious attachment of a recording apparatus to wires, but by the introduction of a short insulated wire in the neighborhood of the station, which would intercept the artificial earth currents produced by the working of the line, and thus reveal the purport of the messages which were being conveyed. It is found that one of the best means of protection against such attempts is the use of an earth plate, placed at some distance from the station, and buried, if possible, in the sea; and, by connecting the station with this plate, the earth currents are discharged in the line of least resistance, and cannot afterwards be made to surrender, by any of the arts and appliances referred to, the secrets they convey." (*Editorial*)

This is too much. Either the unfortunate editor of the *News* is laboring under the effects of an illy-digested dose of physical technics, or he has been outrageously hoaxed by some malicious practical joker. If the latter be the case, we hope, for the honor of the profession, that the perpetrator is not a telegrapher; if he is, then retributive justice would suggest that his person be connected to the *News* editorial sanctum by a "short insulated wire," in such a manner as to divert the line currents his way. Then, when the *News*-man's daily despatches are transmitted over the wires, the frame of the guilty hoaxer will be convulsed by successive agonizing galvanic shocks, induced by those same "artificial earth currents," until his mortal spark o'erleaps its condenser and the punishment ends with his "discharge."

"PEPPER."

The following story originated, we believe, with the San Francisco *Post*. We give it in the words of the Californian writer:

Many amusing stories have been told of the festive freaks of telegraph operators, who, whenever afforded an opportunity for the display of their penchant for a good joke, rarely fail to improve it. Almost everybody has heard of the operator in an Eastern city, who, on a hot summer day, desiring to borrow a chew of tobacco from one of his fellows in the same room, instead of making his request known by words of mouth, chose what he deemed the least exhausting measure of indicting a despatch, which, traveling over a circuit of upward of a thousand miles in about two minutes, reached the identical office whence it started, much to the surprise of the other chap, who blandly shied his tobacco-box at the head of the irrepressible jokist.

It often happens that telegraphers are called into service at the representation of a stage play, in which occurs what is known as a "telegraph scene," such as the one shown in Byron's "Across the Continent," or Boucicault's "Long Strike," and it is then that the operator behind the scenes manages to amuse himself by "talking" to the "fraternity" in the audience, unknown, of course, to most of those present, who find no meaning in the "click" of the instrument.

As an evidence that the operators of our city are not behindhand in the matter of having their fun, the following is related of Jim ——, a well-known *attache* of the Western Union:

During the theatrical season of last year, the drama of "The Long Strike" was produced at one of our theatres, and for the manipulation of the telegraph instrument, which plays an important part in the most important act of the play, Jim was engaged.

His position was such that he could see the audience without being seen, and when, upon taking his position, discovering in the auditorium a brother operator from Memphis, by name Pepper—who had that day arrived in town—he determined to have a little sport on his own account.

Accordingly, when the time came for the sending of the first despatch, Jim loudly sounded on his machine the words, "How are you Pepper?"

The quick professional ear of Pepper caught the words instantly, and wondering "who the deuce it was," straightened up and stared at the stage as if he would have given two dollars and a half to know something more.

"Pepper, how's your mother?" came from the instrument, and Pepper, thoroughly mystified, turned confidently to his fair partner to express his utter astonishment at the most singular circumstance.

As luck would have it, the auditorium held quite a delegation of telegraphers, who by this time saw that Jim was up to one of his old tricks, and, with one accord, they began to look about the theatre for "Pepper."

Jim saw the effect of his experiment, and enjoyed it himself hugely.

Pepper hadn't got through telling his girl all about it when there came another message.

"That won't do, old Pepper. I know you well. and you hadn't better be fooling that confiding creature with any soft nonsense.

This roused the telegraph boys to the very pitch of curiosity, and many of them stood up gazing longingly about them as if their only object in life was to discover Pepper.

Pepper felt that they knew him, and the confusion which had been gradually covering his handsome features, grew into mortification when he saw so many eyes evidently levelled at him, and at last culminated in his withdrawal from the theatre. But Jim was bound to give a parting shot, and as he faded from view he heard borne to his ears: "Good-by, Pepper. Put your trust in Providence, but keep your powder dry.

Those who appreciated the affair were much amused, and so, indeed, was the victim himself, when, on the following day, he learned who had so neatly captured him.

THE following also comes from the Far West: A Spiritualist, old in the faith, and a firm believer, was recently badly sold by the telegraph operator at this place. The old gentleman never missed a chance to advance his belief and convert, if possible, skeptics and unbelievers. The operator was very skeptical and hard to convince, probably owing to his large rotund physical proportions, showing his love for the good things of this life. The old gentleman, at the time referred to, was trying hard to convince our telegraph man, and, among other things, said that he was a medium, and was satisfied that if he took hold of the key some departed operator would take possession of him and and run the "meersheen" The operator politely invited him to take a seat at the key-board and try his mediumistic skill. The old gentleman seized the key and commenced drumming a lively tune, but could write nothing legible or intelligible. The operator came to his rescue, and placing one of the medium's hands on the metallic bar and the other hand on a part of the machine which would form a circuit. When the key was used, the current was broken and preduced a shock. The medium received the shock, and although it was quite severe his countenance brightened up, and he exclaimed: "Oh—, they're coming! I feel—Oh! the spirits!" The more rapidly he played with the key, the oftener it shocked him and the more interested he became. The operator then placed the ground wire and gave him the benefit of the whole battery, The medium squirmed, cried, "Oh!—ah!—ugh! the spirits—ah—will now—oh—ah com—ugh!—mu ah—ni—oh!—cate ugh—ah—oh!" And, jumping up, he let go the key and cried out, "By JUPITER!! *that spirit is too much for me;—never met with his equal!*" By this time our fat telegraph man was rolling on the floor, his sides nearly bursting with laughter. The medium "smelt a mice," and left, satisfied with his experiment.

A NEW INVENTION IN TELEGRAPHY.—When Sir William Thompson invented his reflecting galvanometer, and showed its usefulness for telegraphic purposes, he insured the success of under-sea cables, whatever their length. With this instrument, the movements of the little reflector enables the clerk to read off the message by careful watching. But recently, Sir William Thompson has invented an instrument—the patent syphon recorder—which, as its name indicates, writes or records the message as received, on a strip of paper. It is an essential condition of such an instrument that it shall be very light; and the syphon, in this case, made of capiliary tubing, is not thicker than a horse-hair. Indeed, so small is the bore, that the ink will not flow therein of itself, but squirts out when electrified. The syphon is connected with a coil of copper wire, an electro-magnet and an ebonite disk, armed with pieces of soft iron, which, being attracted by the magnet, is kept rotating, and regulates the current flowing from the battery and the cable. Acted on by this current, the ink, as already stated, squirts from the syphon and writes a succession of dots and dashes which represent the letters of the alphabet. To an unaccustomed eye, the writing is a confused unmeaning scribble; but a good telegraph clerk will read it off as if it were ordinary writing. Thus a message will now, so to speak, deliver itself from the other side of the ocean, thousands of miles distant; and telegraphy has achieved another triumph.—*Chambers' Journal.*

NEW ELECTRIC PILE.—An improvement upon Grove's (platinum plate) battery is claimed by M. Koosen, by the substitution of permanganate of potassa for nitric acid. The pile is formed of a platinum plate in a mixture of the permanganate of potassa, with 1-30 part of sulphuric acid; and an amalgamized zinc element in dilute sulphuric acid. The inventor asserts as the result of over 100 trials, that the electromotive force is augmented; attaining to the double of that of a Daniell's couple of the same superficial area.

THE

ELECTRIC RAILROAD SIGNAL CO.

SPECIAL NOTICE.

OFFICERS OF RAILROAD COMPANIES, and others interested, are notified that this Company is the sole owner of the ORIGINAL PATENT for operating

ELECTRIC SIGNALS

by including a section of a railroad track in the electric circuit, which was issued to F. L. POPE, July 16, 1872. Railroad Companies are **CAUTIONED** against negotiating with unauthorized parties for the use of this Invention, as this Company will take legal measures to protect themselves against all **INFRINGEMENTS.**

J. N. ASHLEY,
Business Manager,
194 FULTON STREET, N. Y.

December 18, 1872.

F. L. POPE & CO.

Manufacturers and Dealers in

Telegraph Instruments and Supplies

OF EVERY DESCRIPTION,

194 Fulton Street, New York.

New and Superior patterns of

STANDARD TELEGRAPH INSTRUMENTS,

Their RELAYS, SOUNDERS, and KEYS which have been specially designed by Mr. F. L. Pope, are elegantly designed, thoroughly well finished and scientifically adapted to the service required and are recommended as SUPERIOR TO ANY HITHERTO OFFERED.

In addition to ALL DESCRIPTION OF TELEGRAPH MATERIALS AND THESE SUPPLIES are furnished, such as

INSULATORS, BATTERIES,
INSULATED WIRES,
CHEMICALS., ETC, ETC.

MAGNETIC AND DIAL INSTRUMENTS.

We have for sale also THE NONPAREIL TELEGRAPH INSTRUMENT for amateurs, learners and short lines.

A COMBINATION SET, comprising Sounder and Key on a handsome rosewood base.

Bradley's Box Relays and Sounders,
Bradley's Apparatus for Electrical Measurement.
Bradley's Naked Wire Helices and Magnet Spools to order, any desired size and resistance, at manufacturers' lowest price.

Descriptive Circular and Price Lists forwarded upon application to

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 5. NEW YORK, FEBRUARY 1, 1873. WHOLE NO. 126.

STATIC INDUCTION.

Electricity has the power of inducing the bodies in its neighborhood to assume a peculiar electrical condition without being in communication with them, which is termed induction. When an isolated conductor *a b* (figure 1) is approached by a body

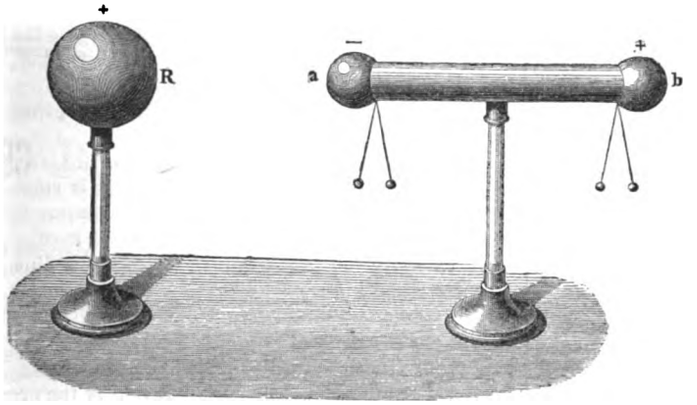

Fig. 1.

R, charged by either kind of electricity, for example with positive electricity, this conductor *a b* becomes likewise temporarily electrified. The + E of the body R attracts the — E of the conductor *a b*, inducing a negative electric state at *a*; and as no — E can be excited without as much + E, the other end *b* is positively electrified to the same extent. The proof that the induced electricities are equal in amount is found in the fact that they neutralize each other when the ball is withdrawn. If the cylinder were made up of two parts, each supported by a glass leg, the two electricities might be insulated on withdrawing the parts from each other while under the influence of the charged body, the one being + and the other —. The neutral line between the two electricities is found to be nearer to the end next the ball, and to shift nearer to that end as the ball approaches. The action of the electricity of the charged ball inducing in the conductor *a b* this peculiar electrical condition is called induction, and the conductor *a b*, in this state, is said to be polarized; that is, to have its poles or ends like a magnet, each having its similar but relatively opposite force.

If the charged body R had been negatively electrified, the extreme end *a* would have become positively and the end *b* negatively electrified.

The electricity produced in this case at *a b* is not caused by R communicating its electricity to the body *a b*, but by the division of the natural, not analyzed, electricity (± E) under the influence of the electricity in the neighborhood; whence the designation of electric repartition—electric influence or static induction, in opposition to the direct communication of electricity, which follows when R is brought in contact with *a b*.

The electricity which is present in the vicinity *a* of the body R is attracted, while, on the contrary, that which is present at the distant end *b* is repelled. When, consequently, the neighboring extreme end *a* is touched, whilst the charged body R remains in the neighborhood of *a b*—the electricity collected there will not be diverted, as will the distant electricity at *b*; whilst the former remains constantly attracted by the opposite one at R, the latter is repelled by R at *b*, and, consequently, flees away from it as far as possible. For this reason it is said that the opposite electricity at *a*, which is nearest to the dividing electricity at R is *bound*, while its correspondent at *b* is *free*.

That the + E at the further half of the cylinder *a b* is as free and insulated as if no — E existed on the other half, is shown by placing a cylinder near the first, forming a combination of it, as it were, without touching, when the second cylinder, under the induction of the + E of the first, is thrown into the same state as the first. This second can induce the same state in a third (figure 2) and so on. When the charged ball is withdrawn the whole series return to their natural condition, without being in any way permanently affected. The moment, however,

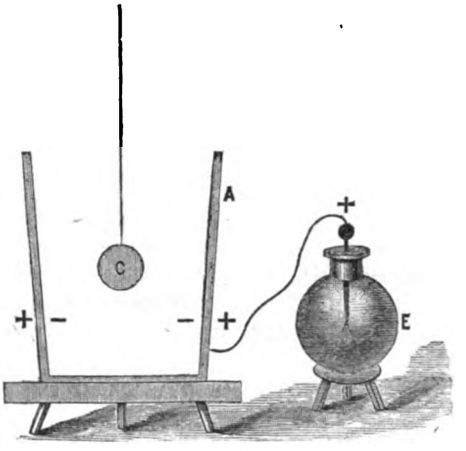

Fig. 3.

it is again brought near, each cylinder becomes again polarized, and there is manifested at the further termination of the last a + E, which would exert the same influence on a body connected with the ground as if a portion of the electricity of such a body had been actually communicated or transferred to it.

The amount of the electricity induced by an electrified body on surrounding conductors, is equal and opposite to that of the inducing body. Faraday proved this by the following beautiful experiment: He insulated an ice pail (Figure 3), ten and a half inches high and seven inches in diameter, and placed the outside of it in conducting connection with the knob of a gold-leaf electroscope (E). A round brass ball (C) suspended by a long dry thread of white silk, was charged with + E,

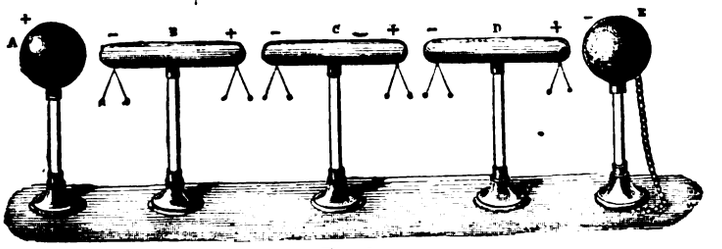

Fig. 2.

and introduced within the pail. The pail was thus subjected to polarization, the induced — E being on the inner and the + E on the outer surface. The divergence of the leaves, caused by the induced + E, increased as the ball was lowered, until it sunk three inches below the opening, when they remained steadily at the same point. The ball was lowered till it touched the bottom and communicated its charge to the pail, when the leaves remained in the same state as before. The ball, when lifted out, was found to be fully discharged, showing that the + E, developed by induction on the outer surface, was exactly the same in amount as that of the ball itself. The — E of the inside of the pail being equal to the + E on the outside, was, therefore, equal to the + E of the ball, but opposite in kind. He altered the experiment so as to have four insulated pails inside each other, and the effect on the outmost pail was in no way altered. No force was lost in the transmission from one pail to the other. We may conclude from this experiment that, on the walls of a room, or other conductors surrounding the charged body, the total amount of opposite electricity induced is equal in amount to that of the body itself.

If the hand touch the cylinder (fig. 1) when under induction, the pith balls next the charged ball diverge further than before, and the other two cease to be affected. In this case, electrically speaking, the cylinder is a portion of the ground, for the hand and body are conductors; its dimensions, therefore, being increased, more — E is developed than before, and the + E is thrown back into the ground and is lost; or, it may be more correct to say, that th + E now spread over the earth as well as the cylinder, an infinitely large surface is infinitely weak or nothing at any point. The — E is kept fixed in the part of the cylinder opposite the ball by the + E of the latter; and when the hand is *first* removed, and *then* the ball, it causes the balls at both ends to diverge permanently. Thus, *when an insulated body is charged by being uninsulated for an instant in the presence of an excited body, or charged, as it is termed, inductively,*

Digitized by Google

its charge is of the opposite kind to that of the inducing body.

It would seem, moreover, by a careful study of the action of induction, that, when a body is charged by contact or spark, its charge is no less due to it. Let us consider the case of charging the cylinder (fig. 1) by the positively electrified ball. When the ball is brought near to the cylinder the latter becomes polarized, and the — E is turned towards the ball. When the ball is near enough, by spark or contact, the cylinder is permanently charged with + E. Now, this must occur in one or two ways: Either the — E of the cylinder, at spark or contact, partially neutralizes the + E of the ball, and a balance of + E flows over to the cylinder to increase the + charge inductively already there, or an equal amount of both electricities becomes neutralized at contact, and the + E of the cylinder already there is left alone without its negative twin. The latter alternative seems the more likely, on many grounds. It seems reasonable to expect that induction, which, at the beginning of its action, can partially charge the cylinder, can, when complete at contact, fully charge it; and it seems unlikely that the efflux of — E, and the extending of the + E, to which the action at the beginning tends, as is shewn by the shifting of the neutral line towards the point of contact, should be immediately succeeded by an influx of + E, as if the charging of the cylinder had to be done partially by one operation and fully by an opposite one. Faraday's experiment shews that no such counterflow takes place. As soon as the ball is low enough in the pail to expend all its inducing force on it, the + E induced on the outside is complete, for the leaves of the electrometer on the ball being lowered further, remain at the same point. The + charge which the pail keeps after contact is not greater than it was before it, for on contact the leaves are not affected. All, manifestly, that contact effects is a junction or neutralization of the + E of the ball, and the — E induced on the inner surface of the pail, leaving the induced + E of the outside as it was before contact. Similarly, in the case of the cylinder, the charge which it ultimately receives is fully developed in it at contact; contact merely neutralizing the — E and leaving the induced + E in undisturbed possession of it. The inside of the pail, as shown by the ball when taken out, is perfectly neutral. The + E which charges the cylinder is equal to the + E of the ball, which is neutralized at contact, for the — E which neutralizes the + E of the ball is the twin electricity of the + E of the cylinder. The result of contact is as if a portion of + E had actually been transferred to the cylinder, the loss of the ball being equal to the gain of the cylinder. Induction manifestly had as much to do with charging by contact, or *conductively*, as it is termed, as it has with charging by momentary contact with the ground in presence of an excited body, or *inductively*, only the electricities communicated are of opposite names.

But induction leads to discharge as well as charge. Let us discharge the cylinder already charged by contact. On the hand approaching to discharge it, the + E of the cylinder in its turn polarizes the hand, causing — E to appear on it, and sending the twin + E into the ground. At contact the + E of the cylinder and the — E of the hand or ground neutralize.

It was formerly charged positively by — E leaving it; it is now rendered neutral by an equal amount of + E leaving it.

Lastly, let us consider the condition of the cylinders (fig. 2) if the positively charged ball were discharged through them into a ball connected with the ground. The polarity of the cylinders would be the same as that shewn in the figure. As the inductive action increases, the opposite electricities become more developed at each end. We must place the cylinders at some distance from each other, and from the ball at the other extremity, so as to prevent them touching and acting as one cylinder in connection with the ground. Suppose them so placed that when a spark passes from the ball to the first cylinder, sparks also pass at the other interruptions. When these sparks occur, the ball and the cylinders are finally discharged. Making use of the same reasoning here as we have done above, we cannot conceive of this discharge taking place in any other way than that at each interruption two equal and opposite electricities neutralize each other. The charged ball becomes discharged by the cylinder next it yielding at the spark as much — E as it has of + E; the cylinders act in the same way to each other, discharging opposite electricities at each end; and the + E of the further end of the last cylinder neutralizes the — E of the ball connected with the ground. There is here no passage of the electricity of the ball into the ground, but the effect is the same as if it did. Induced electricity is the term applied to electricity that appears on bodies before actual contact or spark. It is the forerunner of charge and discharge; these being, in fact, the crisis to which induction tends.

It would thus seem that, in whatever way a body acts, whether as giving or receiving a charge, discharging or lying in the path of a discharge, in every case it is by electricities leaving it and becoming neutralized or disappearing by spark or contact. The usual phraseology of electricity supposes the actual passage of the electricities looked upon as fluids, from, into and through conductors, but the very existence of induction renders such a supposition untenable.

Electric terms, like many others, however, in science, though based on a wrong supposition, distinguish quite definitely the phenomena they describe. Moreover, they express what is true in effect, though not in process, and if we look on electricity as a force of which the + and — electricities are merely the manifestations, we may speak of it as entering, leaving and traversing bodies, as one of its manifestations is, according to the usual phraseology, considered to do.

TEST OF NEW WIRES BETWEEN RICHMOND, VA., AND WASHINGTON, D. C.

Jan. 5, 1873. Weather—hard rain six hours.

Wire.	Station Tested with.	Distance. Miles.	Total Resistance of Wire. Ohms.	Mileage Resistance of Wire. Ohms.	Total Resistance of Insulation. Ohms.	Mileage Resistance of Insulation. Ohms.	Ratio Resist. of Wire to Resist. of Insulation.
A	Wash'n, D.C.	115	1496	13.0			1 to 31.3
	"	115			46,863	5,389,200

The wire is No. 8 gauge, manufactured by Messrs. Washburne & Moen. Insulation glass and pin on four-foot cross arm. Pin and cross arm having two coats of Prescott's compound paint.

NEW THEORY OF THE AURORA.

The *English Mechanic* publishes the views of Dr. Wolfert, a German observer, on the nature and origin of the aurora borealis, which, it will be noticed, are based on speculation, which do not connect the phenomenon with a magnetic or electric source. Dr. Wolfert says: "The sun's rays, falling on the earth, are variously reflected according as they fall vertically, or at an angle more or less obtuse. The earth being conceived as a large mirror, many of the obliquely incident rays will be reflected to a part of the celestial vault on the night side of the earth." The zodiacal light, he ascribes to the irregular reflection of sunlight from water, and similarly the vast fields of ice in the polar regions, he considers, may be regarded as an imperfect mirror irregularly reflecting the incident light. The rays which fall most obliquely are the most abundantly reflected; and as the quantity of reflected light increases with the angle of incidence, adds the author, we may see how the reflected sunlight illuminates in the highest degree the night skies of the region nearest the pole; further, the great similarity of the incipient light of the aurora to moonlight, is thus explained, the latter being also sunlight reflected.

The rays falling on the ice at an angle of 40°, are, however, dispersed as well as reflected. It is commonly said that the point of origin of the aurora is indicated by the direction of the magnetic needle. More correctly, according to Dr. Wolfert, a line drawn from the sun at right angles to the horizon and prolonged, would be the middle of the phenomenon. On this supposition an advance of the central part of the aurora to the north is explained.

The grounds on which Dr. Wolfert rejects the ordinary hypothesis of the aurora, may here be briefly stated. The strongest reason given for supposing a magnetic origin of the aurora, is that the phenomenon seems to originate in the quarter to which the needle points. It is replied that in expeditions to Boothia, Felix and Melville Islands, the needle has in these places, taken a vertical position, and even at times pointed southward, while the aurora appeared in the north as usual. If the aurora consisted of a streaming of electricity from the magnetic pole, it would be difficult to explain how an observer at the pole always sees the light beyond the horizon, as at other places. When lightning strikes a ship, the compasses become irrecoverably useless. But ships have ventured in the midst of these (supposed) currents from the pole, and their compasses have been but temporarily disordered. Neither man nor beast suffer from such currents, nor do sensitive electrometers show any change in atmospheric electricity when the phenomenon occurs.

It is said that the needle shows irregularities before the aurora. But this is by no means a constant occurrence. The polar light and the electric (disturbing) currents may have a common cause. Heat also diminishes the attractive force of magnets, and this might account for the variation of the needle. If the phenomena were electric, it would be difficult to account for their punctual regularity of appearance and disappearance in nothern regions. This is explained, however, when we connect them with the sun.

In recent times, it has been supposed that the sun spots are in some way connected with the aurora. The recurring frequency of the latter every ten or eleven years, is found to coincide with the periodic maxima of the former. Dr. Wolfert suggests the following as a possible explanation: If it be true that the spots diminish the solar radiation, the cold winters that recur in these periods may be thus caused. Now, cold winters imply an extension of the polar ice southwards, and therewith an enlargement of the reflecting surface in the same direction.

WHO PERFECTED THE TELEGRAPH.

It is the common lot of inventors to toil long and fight manfully against poverty, indifference, and detraction. When they have surmounted all these obstacles, and have shown the world that they have discovered something which will benefit humanity, it is all at once found that they have only announced what others had learned before, and a long series of law suits with bold pretenders must be fought out before genius can get its pecuniary rewards. Such has been the fate of most of the pioneers in practical science, and such was that of the late Samuel F. B. Morse. He lived long enough, however, to beat down all opposition, and died with a general recognition of his claims to the gratitude of humanity.

To attempt a reversal of this verdict is a difficult and disagreeable task. It has been undertaken, however, and the statements upon which the case rests are important enough to merit recapitulation. We give them as we find them, leaving the reader to estimate their conclusiveness for himself.

There has just been published in Cincinnati, a volume, of nearly 800 hundred pages, entitled; "Up the Heights of Fame and Fortune, and the Routes taken by the Climbers to become Men of Mark." The work contains interesting sketches of inventors, writers, scientists, and financiers who have special claim to the title of self-made men. It is illustrated with engravings of ancient steamboats, including Western crafts, and locomotives, and by steel portraits. These features, however intrinsically attractive, will excite the attention of the world at large far less than the notices of Professor Morse and his associate, Alfred Vail. To the latter is ascribed the invention of the first available telegraph machine and his partner though admitting that he was not unaided in his invention, is characterized as disingenuous in claiming more than he deserved in producing the perfected and practically serviceable apparatus.

Alfred Vail was born in New Jersey in 1807, and early displayed great mechanical ingenuity. While a student under Prof. Morse at the New York University in 1835, he saw the latter's first rude machine, and became an owner of one-eighth of the patent by virtue of engaging to devote his personal services and skill toward perfecting the invention. He also offered Prof. Morse much needed pecuniary aid. In 1853 the Professor said that to the joint liberality of Vail's father and brother, "but especially to Alfred's attention and skill, and faith," was due the success of his early endeavors to bring the telegraph before the public.

His biographer continues:

From his peculiar experience in all that related to the invention, he was appointed one of Mr. Morse's assistants, on the passage of the telegraph bill in 1843. In his latter years Prof. Morse narrowed his recognition of Vail's connection with the telegraph to the one point of pecuniary aid.

If we may believe the writer of Vail's biography, his subject did more than this.

The Morse Machine of 1836 "passed into Vail's hands in 1837 for an entire mechanical reconstruction throughout, to speak a language not entirely unknown to the first machine, but to perform entirely new functions and to produce an entirely new system of signs and letters, which the first by its structure was physically unable of being made to speak. Alfred Vail invented the first combination of the horizontal lever motion to actuate a pen, pencil, or style, and the entirely new telegraphic alphabet of dots, spaces, and marks, and he did so prior to September, 1837, the month when the old instrument passed into his hands for reconstruction. His more perfect invention of a steel style upon a lever which could strike into the paper as it was drawn onward over a ground roller, and emboss upon it the same alphabetic characters, was not invented until 1844, about the time the first line of telegraph began to operate between Baltimore and Washington. This instrument, somewhat transformed, still holds its place as practically the best ever invented."

The author quotes extensively from the correspondence between Professors Morse and Henry, and reproduces a plain spoken letter from Vail, to show why he did not urge his claims to the credit of the invention. This letter is deemed of so much importance by the publishers that they have given it in lithographic fac-simile. It is as follows:

The lever and roller were invented by me, in the sixth story of the New York *Observer* Office, in 1844, before we put up the telegraph line between Washington and Baltimore, and this *combination* has been always used in Morse's instrument. I am the sole and only inventor of this mode of telegraph embossed writing. Professor Morse gave me no clue to it, nor did any one else, and I have not asserted publicly my right as first and sole inventor, because I wished to preserve the peaceful unity of the invention, and because I could not, according to my contract with Professor Morse, have got a patent for it.

ALFRED VAIL.

As early as 1847 Prof. Morse urged Mr. Vail to sell to him his interest in the telegraph for $15,000, but he refused. He died in January, 1859. Amos Kendall, a friend of both parties said: "If justice be done, the name of Alfred Vail will forever stand associated with that of Samuel F. B. Morse in the history of the invention and introduction into public use of the electro-magnetic telegraph."

After Mr. Vail's death his rights were less recognized than before. Prof. Morse said little about him, and that little, it is contended, was very inadequate. In his address at the inauguration of a statue in his honor he referred to him:

Alfred Vail of Morristown, New Jersey, with his father and brother, came to the help of the unclothed infant, and with their funds and mechanical skill put it into a condition creditably to appear before the Congress of the nation. To those New Jersey friends is due the first important aid in the progress of the invention.

This, in the opinion of Mr. Vail's advocates, was the truth, but not the full truth. They do not deny Prof. Morse the honor of the first conception of the telegraphic system, but they assert that he did not give the credit of its perfection where it was due. They also claim to have learned in a "semi-private way" that during his last illness the Professor expressed anxiety to do justice to Mr. Vail. We attach little importance to prying gossip of this kind, but the statements previously presented are of sufficient weight to merit some notice. If injustice has been done to Mr. Vail, it is not too late to do him posthumous honor and rescue his name from the obscurity into which it has fallen.—*Cincinnati Gazette.*

THE DUPLEX TELEGRAPH INSTRUMENT IN ENGLAND.

An alleged important discovery in Telegraphy is just announced in England, consisting in a device said to be original with Mr. Preece, the Postal Telegraph Engineer. It consists in an arrangement of instruments for sending messages in both directions at once by the use of one wire.

This is an American improvement, invented here some years ago, by J. B. Stearns, and by him patented. It has been in use on the lines of the Western Union Telegraph Company in this country for a considerable time, with much success. It doubles the transmitting capacity of every telegraph wire, and is regarded here as one of the most important inventions that have been made since the introduction of the electric telegraph system.

We are glad that our British cousins have at last waked up to an appreciation of its value, even if they credit the discovery to the wrong individual. It might be well for the British telegraph authorities to send over here for a few hundreds of the Stearns machines and put them in use at once; thus immediately doubling the capacity of their wires, and saving them from further experimentation upon the subject.—*Scientific American*

RATIONAL GOVERNMENT ENTERPRISE.

The telegraph in private hands is an all-night business. The postal service in government hands has its departmental hours. When the government takes the telegraph and hitches it to the postal service, it must either reduce it to departmental hours, which would be equivalent to setting the world back half a century, or it must do an all-night business. If it is proposed that the government telegraph shall try to keep up the accommodation that private management has established, and shall do the night work that is demanded, would it not be well for it to first get its hand in by doing what night work is needed by general business and the press, in distributing the matter received by the mails, so that it can reach parties if received after nightfall? This, and the reasonable dispatch of letters from the place of mailing, would save the press much expense in telegraphing, and would enable business men to shorten the time of receiving and answering letters to the extent of one business day. In many ways the management of the Post-office Department could be improved so as to increase the business of the mails and save telegraphing, if the same enterprise and care for the public convenience were brought into it that private management has established in other carrying business.

One of the reasons given for government assumption of the telegraph is that it would reduce the cost, and thereby increase the accommodation of the public. But the postal department does not now get the business that legitimately belongs to it, nor do the duties it ought. It is far inferior to the service done by the telegraph and express, through the more energetic management and responsibility which business management has created in these lines. The Post-office neither has the business that belongs to it, nor does the service the public have the right to expect from it. It is slow in all its movements, departmental in its hours of business, and wholly irresponsible. No matter how much it may register letters, it shows the measure of its trustworthiness by refusing to be responsible for them. It does not serve the demands of the great newspapers, either by carrying news to them with sufficient promptness, nor by carrying the papers when printed. Private agencies have to be called in to do this work. The great news business—the business of gathering and publishing intelligence—has chiefly to be done outside the postal department, because of its lack of energy and wieldiness.

The Postmaster-General is looking about for other worlds to conquer; yet his own province is half a century behind the age, as measured by the energy, practical accommodation, and responsibility of other branches of the carrying business. We suppose no one is to blame for this. It is the way with government doings, especially in a government of the elective kind, in which the public offices are regarded as made for the reward and convenience of those who hold them. The telegraph and the express would have been as far back as the mails if the government had managed them. There would be no night work of the telegraph. Deliveries by carrier would be made not more than twice a day, even if once did not suffice. The circuit would be cut off at 7 o'clock, and 24 hours would be thought short enough for receiving and answering a telegram. The same departmental system would prevail in the government express, and no matter what it charged, it would not venture to trust its employés so far as to make itself responsible for packages. The Post-office thinks it can assume what the telegraph has done under private management; but it would be far more rational for it to try to introduce into its own province some of the energy and accommodation and responsibility that private management has established.—*Gazette, Cincinnati.*

CORRESPONDENCE.

HONOR TO WHOM HONOR IS DUE.

To the Editor of the Journal of the Telegraph:

It is to be regretted that in your honorable mention of the services of Messrs. Barr, of Elizabeth, and Ricker, of Newark, during the troublesome days succeeding the storm of January 5th, you overlooked Mr. Hynes, of Williams Bridge. Only one out of the thirty-four wires leaving the city on the Harlem and New Haven Railroads remained intact to Williams Bridge on the day following. With the instincts of a veteran in the service, Mr. Hynes discovered it and put himself in communication with the metropolis. Like a faithful sentinel "standing by his gun," he stood by that solitary wire all day Monday and slept by it all Monday night, and when on Tuesday the other wires showed spasmodic signs of vitality, and the chiefs in New York thought an additional circuit might be made up, quick as lightning this minute man responded to their summons, and executed the directions given with commendable alacrity. Without detracting from the merits of others, he is looked upon in the New York office as the most agile of all with whom they have to do, in making changes with the wires, frequently effecting a connection before the order directing it has been entirely sent. If Mr. Hynes could but get just such a switch as he wants, he would be the happiest man in the service.

"FIAT JUSTITIA COELUM RUAT."

STRAWBERRY POINT, Ia., Jan. 10, 1873.

To the Editor of the Journal of the Telegraph:

This is the terminal point of a line from Davenport, Ia., with a main battery at the latter place only. My wire is grounded in a cellar, in ground full of water and where frost never enters. During a severe storm, a few days since, the wire was grounded at first station below me, about twenty-one miles from here. For two days I had sufficient current to get everything that came over the wires, but could not, myself, get a response from any office on the line. I think the solution of the problem of my getting circuit with ground wire on below me, is this: My ground connection being so much better than the one below, that part of the current passed over and came to me. I can't understand why I could not get answer from offices below me. Will you please explain the cause of this in your next issue.

NOVICE.

Answer.—The fact of your ground connection being so much better than the ground formed at the station referred to, was not the cause of your being able to hear what was transpiring beyond. It was owing to the imperfect nature of the connection with the ground at the point below you, that a portion of the current reached your office. This connection, however, was sufficiently good to form a circuit with the battery at Davenport, and so prevented you making yourself heard.

DALTON, GA., Jan. 12, 1873.

To the Editor of the Journal of the Telegraph:

Suppose a customer (a traveling man), newly arrived, requests me to notify the manager of another office to forward any telegrams to his address, to this place, should it be done free, or charged for as on other business? MANAGER.

Answer.—Such a message must be charged for. No messages are entitled to be transmitted free over the wires of this Company, unless duly authorized.

ROSELLE, N. J., Jan. 18, 1873.

To the Editor of the Journal of the Telegraph:

If an insane woman (though it not be known to the receiving clerk at the time) were to go to an office and have a telegram sent, and afterwards her husband should come and inform the manager of her insanity, and at the same time forbid his receiving another message from her, would he be justified in sending a second message for that person? It conflicts in no way with rule 20. G. A. R.

Answer.—We do not see how the message could be refused if payment be tendered. The fact that you had been notified by her husband or any other person that the woman was insane, would not necessarily prove such to be the case. You are not obliged to obey the *dictum* of any second party as to the reception and transmission of any message offered, but will be governed wholly by the regulations of the Company.

To the Editor of the Journal of the Telegraph:

A party here wished to send a message, but said they would not pay for an answer if any came, and I refused to send the message unless they would guarantee payment for answer, as their message read as though they required one, and pertaining to their own business. They think I am not right in exacting charges for an answer to a message, which answer they did not want. Please let me hear what you think of it in your next issue, and oblige.

The message read as follows: "Why don't our stoves come. Been on your line since Dec. fifth."

Answer.—Rules cannot be framed to meet every question which may arise. Whenever the letter of a regulation cannot be met, an intelligent interpretation of its spirit becomes a duty. The regulations governing the service of the company are intended for the protection of its interests, and not to repel business offered. With the explanation given you, you could not rightfully exact the guarantee. The proper course would have been to have sent the message, and with it an office message stating that no answer was required, but if one was offered, to require that it should be prepaid.

To the Editor of the Journal of the Telegraph:

Often parties get off trains and come into offices, write their messages, but before having time to count words, make change, &c., the trains start. They will cry out, Send it collect. This, in most cases, would be all right, and would be a great accommodation to the sender, but, as the rules hold the operator responsible, it cannot be sent. Probably in most cases they would be paid. Would it not be better to send such messages collect, and in case they were not collected upon, the operator to send them in with proper explanation, thereby accommodating our patrons and benefit the company pecuniarily at the same time. This is also the case with the class of people called "drummers;" they want to telegraph to their firms collect, which we decline to do; they become indignant and will not send it. There are cases where, I think, it should be left to the operators to use their judgment, and not be held responsible for the amount.

Answer.—No discretion can be allowed in cases of this nature. There is no more reason that a message should be taken from a passing traveler, at the company's risk, than that a tailor should furnish him with a suit of clothes upon similar terms of payment. The same reasoning applies to the messages offered by persons designated by our correspondent as drummers. While the company are willing and anxious to accommodate customers to the fullest extent, they are unwilling to do so under any liability of loss for their valuable time and labor expended in so doing. Rule 11 covers service of this character, and its provisions must be adhered to.

W. C.—No railroad operator has a right to break in on an operator who is sending commercial business unless he has matters of importance to communicate about. Any operator who should break in for the purpose of inquiring the time of day, or any other trivial question, would deserve, and probably receive, summary treatment at the hands of his Superintendent. Should a case of this kind occur, the operator sending commercial messages should promptly give up the circuit and report the facts to the Superintendent.

M. A. B.—You had no right to furnish a copy of a received message to any person other than the party addressed, no matter upon what plea. If trouble arose, you, undoubtedly, would be held responsible.

Dominick.—In Rule 13, the charge of one-half the usual rates means one-half the usual rate for ten words. This is an important regulation, and customers should be made familiar with its working. Were it generally observed, there would be no necessity for many of the office messages which now encumber the wires, and customers would be better satisfied. We quote the rule for general information:

"Whenever a person sending a message desires to know that his correspondent has received it, such information may be furnished to him from the manager of the office to which the message is transmitted at one-half the usual rates. In such cases the signal "34" will be sent with the message, signifying that the sender wishes a reply from the manager of the office at the place of its destination, stating whether the message has been delivered to his correspondent or not."

C. A. S.—Tariff books of the Western Union Company are not for sale.

F. P. D.—We have no copies of the engraving of Prof. Morse.

BORN.

ORVIS—At Manchester, Vt., Jan. 15, 1873, to L. C. Orvis, Manager W. U. Tel. Office, a son.

RUNYSON.—At Reading, Pa, Jan. 6, 1873, to W. H. Runyson, Manager W. U. Tel. Office, twin sons.

MARRIED.

FICKINGER—DUNN.—In Girard, Pa., at the residence of the bride's parents, Jan. 16, 1873, by Rev. J. W. Lowe, H. M. Fickinger, Train Dispatcher on the Franklin Division, L. S. & M. S. Ry., to Miss Mary A. Dunn, daughter of John Dunn, Esq.

McDONALD—BURNHAM.—At the residence of the bride's father, Halifax, N. S., Jan. 22, 1873, by Rev. John E. Goucher, David McDonald, Operator W. U. Tel. Office, Halifax, to Georgiana, second daughter of James F. Burnham, Esq.

RAPER—CAMPBELL.—At the residence of the bride's parents, near Frankfort, Ind., by Rev. Mr. Koutz, Jan. 1, 1873, Mr. Geo Raper to Miss Nannie E. Campbell, Manager W. U. Tel. Office, Kingans Stock Yards, Indianapolis, Ind.

DIED.

SPERRY.—At Meriden, Conn., Dec. 16, 1872, of heart disease, A. W. Sperry, late Operator American House, Boston, Mass., aged 19 years.

OBITUARY.

Dr. THOS. L. A. VALIQUET died Dec. 30th, 1872, of small-pox, at his residence in Chicago, Ill. Deceased was for many years an operator in that city, having filled the position of all night manager creditably for a number of years. About a year previous to his death he graduated from Rush Medical College, Chicago, with the highest honors, and at the time of his death held the position of Consulting Physician in one of the hospitals of that city, the duty of which position he performed faithfully in connection with his other situation as telegrapher. Being of a kind, warm hearted nature, he had many friends in the profession. Peace to his ashes.

FOREIGN TELEGRAPHIC ITEMS

THE WEST INDIA AND PANAMA CABLE.

The *Panama Star and Herald* publishes a report of the annual meeting of the West India and Panama Telegraph Co. The shareholders expressed themselves dissatisfied with the long delay of the Chancery suit, and thought it would be better to settle the differences with the contractors. We are sure the public on the west coast of the Pacific will be of the same opinion. Hitherto they have been tantalized, first, by the announcement that the Colon and Jamaica cable was open to the public—and then to be disappointed as to the regularity with which the telegrams were dispatched to their destination—and, finally, after being laid and proclaimed to the world to be all right, it is now again all wrong.

A CONTRACT has been signed by Messrs. Siemens Brothers, to lay a submarine cable (under exclusive privilege for forty years) between Rio de Janeiro and the cities of the River Platte (Montevideo, in Uruguay, and Buenos Ayres, in the Argentine Republic). This cable is for the Platino Braziliera Telegraph Company, represented in London by Mr. A. Rieke. It is to be laid within six months, the capital having been entirely subscribed in South America.

THE tender of Messrs. Siemens Brothers, telegraphic contractors, has been accepted by the Government for the construction of a line from Fort Beaufort to Colesberg.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ending the 21st Dec., was 295,856—being an increase of 47,641 as compared with the corresponding week of last year.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom, during the week ended Dec. 28, 1872, was 232,329—an increase over the corresponding week of the previous year of 49,309.

NATIVE merchants have petitioned the Japanese Government for permission to construct railroads and telegraph lines. The petitions were granted. The work is to be done under the supervision of the Public Works Department.

THE telegraphic lines of the Republic of Salvador, C. A., are all reported in good working order.

IN Nicaragua, C. A., Don Adolfo Escobar has been named Director-General of Telegraphs.

THE English Telegraph Construction and Maintenance Company have made good progress with the new French Atlantic cable, and a portion of the line has already been shipped on board the Great Eastern. Many improvements have been introduced, with the object of securing complete insulation and protecting the shore ends from abrasion. Portions of the old Mediterranean cable, taken up after twelve years' submersion, are exhibited at the company's works. In some parts the cable has been encrusted with marine formations and deposits; in other sections the outer coatings have been completely eaten away. The appearance of the Mediterranean wire has taught the manufacturers several useful lessons in the discovery of means by which the destructive agencies of the ocean may be overcome.

AMONG the notices in the Barbadoes House of Assembly, was one to grant a subsidy to the West Indies and Panama Telegraph Company.

THE direct Spanish Telegraph Company have announced that direct telegraphic communication with Spain has been established by the laying of a submarine cable between Bilbao, in Spain, and the Lizard, in Cornwall, and that the line has been opened for public traffic.

A DECREE has been issued granting a concession to Lascarte for laying a telegraph cable between Spain and Cuba. Offers have been received by the Spanish Government, from British Companies, for the purchase, maintenance and management of the telegraph lines.

Mr. EDEN, in-door engineer in the Edinburgh telegraph office, has invented a system by which, with the existing instruments, it has been found practicable to send messages from both ends of a single wire simultaneously. The invention has been tested between Edinburgh and Glasgow, and it has been found that one wire is capable of doing double work.

THE Melbourne *Argus* of the 7th of November, speaking of the telegraphic communication between the mother country and the colonies, says: "Our English telegram this morning well illustrates the advantages we enjoy from direct communication with the mother country. The election of a President of the United States of America took place on Tuesday, and the result was on Wednesday transmitted from London to Australia, the intelligence of General Grant's re-election reaching Melbourne soon after eight o'clock last night. This achievement may be properly recorded amongst the telegraphic triumphs of the age."

THE SOCIETY OF TELEGRAPH ENGINEERS.

The following is a list of the names of the officers of the Society of Telegraph Engineers for the ensuing year, elected at the general meeting held in the meeting room of the Institution of Civil Engineers: President, Frank Ives Scudamore, C. B.; Past President, C. W. Siemens, F. R. S., D. C. L.; Vice-Presidents, Lord Lindsay, Sir William Thomson, and Messrs. L. Clark and R. S. Culley; Council, Colonel Stotherd, R. E., Prof. Foster, F. R. S., Captain Colomb, R. N., Major Malcolm, R. E., Major Webber, R. E., Prof. Abel and Messrs. E. W. Whitehouse, C. F. Varley, W. H. Barlow, W. H. Preece and Carl Siemens; Associate Members of Council, Prof. Bottomley, and Messrs. J. Bordeaux and H. G. Eriehsen; Treasurer, Major Webber, R. E.; Honorary Secretary, Major Frank Bolton; Auditors, Messrs. J. Wagstaff Blundell and F. C. Danvers; Secretary, Mr. G. E. Preece.

DAMAGE TO TELEGRAPH WIRES AND CABLES.

The late spell of warm weather, in its action upon the ice in the Hudson and Delaware rivers and the streams feeding them, caused considerable damage and trouble to telegraph wires and cables. Closely following upon the rise of the Delaware, which, at Trenton submerged all of the wires crossing upon the bridge and inflicted other damage to telegraph property, we learn that the outgoing ice at Albany, N. Y., caught five cables belonging to the Western Union Telegraph Company, each containing seven wires, pulling them out from the cable house on one shore, but fortunately they remained fast at the other, and can easily be relaid when the state of the river renders it practicable. Connection was at once made by stringing wires across the bridge, and but little or no delay occurred to business.

At Stockport, lower down the river, the bridge was carried away, and with it went six wires, all the wire upon that route. The cable crossing Catskill Creek was also torn away. They have since all been repaired.

ON MAGNETIC DISTRIBUTION.

BY M. JANIN.

M. Trève has communicated to the Academy of Sciences, Paris, a paper on "Magnetism," in which he announces, amongst other things, that the poles of a magnet are displaced and removed from its extremities when a soft iron armature is fitted to them. He believes that he demonstrates this, by placing opposite the magnet a magnetic needle, and showing that its direction changes after contact is made with the armature, whilst admitting that the pole is thus prolonged in the direction of this needle.

Firstly, it is necessary to define the word pole; it must also be remarked that in this experiment the magnetic needle is opposed to the attraction of the steel which forms the magnet, of the iron which constitutes the keeper, and also to the attraction or to the repulsion of the free magnetism of the magnet. Its direction follows the result of these very complicated actions, which depend on the distance, the weight, and the shape of the armature, and above all upon the distribution of the magnetism in the magnet itself and its keeper. It is therefore apparent that the direction accruing from so many diverse causes cannot lead to any definite conclusion.

That which ought to be first settled in this question, is the distribution of magnetism in the magnet both before and after the application of the keeper. This is a manner which has occupied my attention for a very considerable time, and I take the present opportunity of saying a few words thereupon.

I studied this distribution by two processes, the one of which corroborates the other. The first consists in placing upon the extremity of a magnet a small soft-iron electro-magnet enveloped by a copper wire communicating with a galvanometer. An induction current is thus produced, causing a deflection of the galvanometer, and the measure of the arc of impulsion enables the intensity of magnetism at different points touched to be very readily measured.

The second process is very analogous to that of Coulomb: it consists in placing upon the spot of which it is desired to study the magnetic character, a small sphere of soft iron, attached to which is a device by which it can be dragged away from contact. The tension, at the moment it is detached, is proportionate to the amount of magnetism at each point of contact.

If the magnet has its extremities free, we can recognize that the free magnetism increases progressively in intensity from the neutral line to the extremities. The curve of intensity is very nearly that which Coulomb had indicated.

When the keeper is applied, all is changed; two poles appear at the two extremeties of the keeper, the free magnetism in part disappears. Receding from the two extremities it reaches a maximum, again decreasing towards the neutral line. The conditions of these modifications are very complicated, and require searching investigation. They contribute to produce the changes in direction of the needle examined by M. Trève; but these changes cannot in any case disclose the magnetic distribution within the bar, and it is not desirable to assume that they indicate any change in the position of the poles of the magnet.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
February 1, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

On and after February 1st, 1873, (with the exception named below,) there shall be no rates between Western Union offices higher than $2.50 for messages of ten words. All rates, therefore, which are at present higher than $2.50, should be reduced to that amount.

For example, a message sent from New York to San Francisco, whether paid or collect, should be checked at rate of $2.50 and 17. If received paid from San Francisco, at rate of $2.50 and 17, but if "received collect" from San Francisco, it should be checked at rate of $2.75 and 18.

EXCEPTION.—The tariff on messages "received collect" from offices in Nevada, California, Oregon, Washington Territory, British Columbia, and Kelton, Ophir, Simpson's Springs, Stockton, Deep Creek and Tooele City in Utah, by offices of the Eastern, Central (except those west of Omaha referred to hereafter) and Southern Divisions, will be $2.75 and 18.

Offices west of Omaha will make no extra charge for messages "received collect" from those offices in Utah (named above), Nevada or California, to which their present rate is less than $2.50. Government rates are to remain unchanged.

Beaver Meadow, Ala., closed.
Fox, Ill., closed.
New Memphis, Ill., re-opened.
Fossil Creek, Ks., changed to Russell, Ks.
Kingsville, Ks., closed.
Wilson's Creek, Ks., changed to Bosland, Ks.
De Soto, Ks., closed.
Howard, Mich., the office on other lines, printed in tariff book, is in Montcalm County.
Standish, Mich., P. O. A. is Granton, Bay Co.
Point-du-Chene, N. B., closed.
Messages may be taken for Hamilton College and Franklin, N. Y., to be delivered from Clinton, N. Y. Twenty-five cents for delivery should be collected.
Plank Road, O., changed to Randall, O.
Florence, O., P. O. A. is Campbellstown, Preble Co.
Confluence, Pa., P. O. A. is Confluence, Somerset Co.
Glencoe, Pa., P. O. A. is Southampton Mills, Somerset Co.
Marion, S. C., re-opened.
Big Bend Tunnel, W. Va., changed to Talcott, W. Va.
Miller's Ferry, W. Va., changed to Hawk's Nest, W. Va.
Richmond Falls, W. Va., changed to Meadow Creek, W. Va.
Stretcher's Neck, W. Va., changed to McKinderee, W. Va.
Alderson, W. Va., should read { 35 2 133 Greenbrier W. S. Spgs., W. Va. / 65 4 203 Huntington, W. Va.

CUBA CABLE BUSINESS.

The following should have been given in notice of Cuba Cable Rates and Rules, published in JOURNAL of December 15, 1872. An extra charge of three dollars gold should be added to the charge for each Cuba cable message, to pay charges for dispatch boat between Key West and Havana.

WILLIAM ORTON, President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, Jan. 22, 1873.

From and after Feb. 1st, *Marshalltown, Iowa*, in J. J. S. Wilson's District, will be closed as a money order office.

Hallville, Texas, in L. C. Baker's District, has been closed as a money order office.

G. H. MUMFORD, Vice Pres't.

EXECUTIVE OFFICE,
NEW YORK, January 31, 1873.

On and after March 1, 1873, money order offices will be established at the following points in G. T. Williams' district:

Cadiz, O.
Cambridge, O.
Huntingdon, W. Va.
Pomeroy, O.

G. H. MUMFORD, *Vice Pres't.*

TELEGRAPHERS' MUTUAL INSURANCE ASSOCIATION.

ACKNOWLEDGMENT OF NOS. 34, 35 AND 36.

15 22 237 302 420 447 627 632 659 931 1001 1048 1163 1187 1254 1267 1367 1407 1424 1446 1500 1582 1618 1627.

ANOTHER death is reported, that of Minah G. Chettle of Memphis. He joined last October, when in good health, was taken sick December 2d, and gradually grew worse until January 23d, when he died of consumption of the brain. This death, and that of R. S. Raymond of New London, will make another double call necessary.

NEW YORK, Jan. 24th.

FIRE ALARM TELEGRAPH.

The subject of providing Brooklyn with a perfect fire alarm telegraph system similar to that employed in New York, is now being agitated in official circles. The present system of fire alarm telegraph in Brooklyn cost only about $5,000, as connections were made with the police telegraph wires.

EXECUTIVE OFFICE
WESTERN UNION TELEGRAPH COMPANY,
NEW YORK, Jan. 23, 1873.

EXECUTIVE ORDER NO. 143.

Executive order No. 127 is hereby modified as follows: Upon presentation of a half-rate or red frank of this Company, the holder will be entitled to transmit messages, and receive answers thereto, upon payment of one-half the regular day rates. No rate to be less than twenty-five cents.

The franks do not cover collect messages which are not answers.

All messages sent under "Half-rate Franks" will be *checked at full rates*, and offices sending such messages will return them as "*uncollected*," entering in "uncollected" account the uncollected one-half of the tolls, and forwarding the messages with their monthly reports as vouchers.

WILLIAM ORTON, President.

THE TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

ORGANIZED IN 1867.

The heirs of deceased members receive one dollar from each of the surviving members of the Ascociation.

All engaged in the Telegraphic service are eligible to membership, if in good health and of good character and habits. Initiation fee $1.50.

Blank forms of Application and Restoration may be had of the Secretary, or of any of the following Agents:—

Augusta, Ga.,.....J. M. Crowley.
Baltimore, Md.,.....Archd. Wilson.
Buffalo, N. Y.,.....J. W. Tillinghast.
Cincinnati, O.,.....F. A. Armstrong.
Chicago, Ill.,.....W. C. Long.
Cleveland, O.,.....H. L. Melton.
Clinton, Ia.,.....E. O. Wait.
Erie, Pa.,.....G. W. Baxter.
Erie R'y Telegraph,...W. J. Holmes.
Harrisburg, Pa.,.....H. A. Clute.
Indianapolis, Ind.,.....D. C. Hinsdale.
Mobile, Ala.,.....Wm. Sandford.
Memphis, Tenn.,.....J. J. Fowler.
Milwaukee, Wis.,.....D. H. Henshaw.
New Orleans, La.,.....Jas. T. Alleyn.
Nashville, Tenn.,.....E. C. Boyle.
Philadelphia,.....Jas. Merrihew.

INTERNAL ARRANGEMENT OF THE BRITISH POSTAL TELEGRAPH SYSTEM.

We have been favored by Superintendent D. H. Bates with the following extracts from letters received by him from Mr. H. Blanchford, of the Engineers' Department, Southern Division, of the British Postal Telegraph service. These extracts portray, in some degree, the working of the English system in special emergencies, affording, however, no new ideas, as the arrangements are very similar to those employed in our own service in analagous cases. In place of any comments we might have made upon the statement of the average delay allowed upon each message—five minutes, where the circuit is direct, and ten where the message has to undergo one repetition, we present the editorial article in the first number of the *Telegraphic Journal*, a new London monthly, which appeared November 15, 1872. As speedy transmission is among the points of excellence, especially claimed by the British Postal service, and the time allowed for delays is regulated officially, it becomes of interest to see in what manner governmental service is superior to that of private companies.

The information presented in Mr. Blanchford's letters of the inner working of the system in England will be particularly interesting to American telegraphists, who, with but few exceptions, have had but little knowledge of the manner in which the operating service was conducted in the only country where the business, in point of magnitude, resembles that of our own.

Mr. Blanchford writes:

Your favor of July 2d reached me about three weeks after that date, and would have been acknowledged earlier but for the intervention of a series of "special arrangements," consequent upon the visit of the Prince of Wales to some watering places in my section, and later to the necessity for providing facilities for the despatch of the increased private and press work arising out of the Autumn manœuvres which have also taken place within my section.

Touching these, you may be interested to learn that 14,000 additional private messages and 600,000 words of press work were disposed of in the district over which the troops manœuvered.

"Special arrangements" are not, as a rule, very remunerative, but they are encouraged, as testing the elasticity of our system and its adaptability to any circumstances. For example, Salisbury, a small town in Wiltshire, where the Commander-in-Chief established his head-quarters, has, for general purposes, the part use of a wire to London, and of another wire to Southampton, but by diverting a portion of the work of some other towns, we were able to provide four *clear* London wires during the daytime, and at night, when many of our wires are "suspended"—*i. e.*, are not used—ten press circuits were brought into use.

With us, Inspectors occupy the third grade in the Engineers' branch. First come the Divisional Engineers, followed by Superintendents and Inspectors.

No Inspector, however, can hope to succeed, or to give satisfaction, unless he is thoroughly conversant with every detail of the commercial working. He must be able to judge as to the capacity of a wire, and, in cases of complaints of delay from insufficient wire accommodation, which are often made by postmasters and clerks in charge, should be able to decide whether more wires are required, or whether the delay can be prevented by improved manipulation.

The delay allowed for each transmission of a message of ordinary length is five minutes.

Thus, a message from Southampton to London (sent upon a direct wire) should occupy but five minutes in transit, irrespective of delivery; while for a message from a small office, for which Southampton transmits, ten minutes are allowed for a message to reach London, and the result is that our maximum delay is something under half an hour.

In another communication he says:

The figures quoted in your last favor indicate that there is no want of enterprise in the administration of the telegraph on your side of the Atlantic.

I should have added, with reference to the messages and press work dealt with during the Autumn manœuvres, that the business was transacted at small, isolated places, where, usually, press work is unheard of, and the number of ordinary messages is so trifling as hardly to make the offices remunerative.

So well provided are our principal offices, that, with a few hours' notice, we can guarantee the dispatch of any quantity of matter. For example, at Exeter, on October the 24th, 21,000 words were sent off without delay or inconvenience, between the hours of 9 P. M. and 2 A. M., four wires being used, two fitted with Wheatstone's automatic apparatus, and two with ordinary keys. This was quite exclusive of the news *received*, which is heavy, considering the small size of the town, and would amount to another 20,000 words daily. Upon the occasion referred to, the Attorney-General had been giving an account of his stewardship during the last session of Parliament, and some of the leading journals obtained special reports by wire.

In our central office, Telegraph street, London, a gallery is set apart for the general press work, *i. e.*, that supplied by contract, or otherwise, by the associations to the newspapers, rooms, clubs, &c. In this gallery are a number of "Wheatstones" (fourteen or sixteen), from which news is sent during eighteen or twenty hours daily to the chief towns or "centres," whence it is distributed by means of local circuits to the smaller towns.

I am not in a position to state the exact amount of press work thus dealt with, but it cannot be less than 200,000 words daily during the sitting of Parliament, as the average speed upon the press wires is about sixty words per minute, and not unfrequently the number of wires has to be augmented. Independent reports of any special occurrences are disposed of upon commercial wires, the nominal business being diverted *pro tem.*

The price charged for this description of work is very low. Between the hours of 7 A. M. and 7 P. M. seventy-five words can be sent for one shilling. If to more than one address, two-pence is charged for each extra copy. From 7 P. M. to 7 A. M. one hundred words can be sent at the same price and upon the same terms. No further reduction is made, whatever the length of the message may be. Thus, 2,000 words to two addresses would cost £1 3*s.* 4*d.*

The employment of Wheatstone's automatic arrangement increases three-fold the capacity of a wire. This is the only gain, as rather more staff is required than if the work were keyed upon separate wires. Generally speaking, clerks are easier to be obtained than additional wires, and, in cases of pressure, the speed is maintained for hours at one hundred words per minute, four clerks being usually kept at the receiving instrument.

GOVERNMENT TELEGRAPHY.

From The Telegraphic Journal (London, Nov. 15, 1872).

The purchase of our telegraphic system by the State is in theory a matter of congratulation for the public, and we even look forward to the railways being bought up in the same manner. We say in theory, because in England the principle obtains that what belongs to the Government belongs to the people. But, unfortunately, in the case of the telegraph, it is too much in theory and too little in fact that we derive benefit from the change which we expected would prove to be so advantageous. We can certainly send messages at a cheaper rate, and we are given to understand that the use of this means of communication has greatly extended under the new *regime*. So far so good; but we hear complaints around us that the main advantage of telegraphic messages, namely, their speed of transmission, is, to a great extent, denied us. The electric force, in deed, appears to be as willing and as quick as ever; but, for reasons best known in Telegraph street, the length of time taken to transmit a given message is too often reckoned in hours instead of minutes. In the present state of things a case such as this is possible: A, in London, intends to call on B, who is about 50 miles away. Regardless of expense, A "flashes" a message to B to notify his intention. He leaves by the next train, arrives at his destination, and finds, much to his own astonishment, that he takes B by surprise. An explanation ensues, during which the tardy message arrives recording an intention that has become an act. Something of the sort has come within the writer's own experience.

Before the invention of the electric telegraph the natural and obvious difficulty for the transmission of messages at a speed as rapid as that for which the wire offers such facilities would be to find the practical means. These practical means are provided by science. The difficulty is then surmounted? Not so; there is now another to be overcome, by no means a natural or an obvious difficulty; in fact, a very artificial difficulty; a difficulty created by ourselves, or which we allow others to create for us—it is red tape. The precious moments which are supposed to be gained by "flashing" the message from place to place are allowed to be lost many times over because the telegram must wait on a table for a clerk to sign it. Thus the advantage to be derived from "flashing" becomes in many instances purely imaginary, and if it were not for this sentiment we might often as well have written by post. That is cheaper, more confidential, and a word or two more makes no difference in the price.

Need all this be? Is it absolutely essential that the messages should be allowed such lengthy breathing times out of consideration for the speed at which they travel? It is urged that if we will send to a crowded wire our messages must wait their turns. But why should the wire be crowded? Why not tell us when it is full? Why receive more work than can well be got through? Speed is the very essential of the telegram; it is its *raison d'être;* therefore there is no good in reducing the charge for this convenience if the convenience itself vanishes. It becomes in fact much more expensive. We now pay a shilling for a telegram when a penny stamp or even a halfpenny card would have sufficed. In former days a telegram was an outlay, certainly, but we paid much for a speed that we obtained. Many would still pay as much for the same advantage, but find they pay a reduction for a ghost of it. With many a business man the rapid acquisition or transmission of information directly and enormously affects his worldly interests; and it is such men who are among the best customers of the wire, but who are sacrificed for the apparent good of the more general public.

Now, we are not opposed to the government possession of the telegraphic system; we say in theory it is preferable to the possession by private companies; but we see no reason why we should not derive actual benefit from the change. That we do *not* derive actual benefit will, we think, be felt by at at least the majority of those who daily use the wire. It appears to us that the evil is not by any means necessary. We speak, however, in considerable ignorance, for so reserved are the authorities of this department as to their arrangements, and so averse to our seeking any useful information on that point, that we cannot prescribe the exact remedy for the evil. But we may bear this in mind; that all the real and practical difficulties would lie in the science of the matter; *i. e.*, in the instruments employed; that the post-office has the very best instruments at its service. The speed is a marvellous triumph of science, the delay is a created obstruction of routine.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, FEBRUARY 1, 1873.

THE General Superintendents of the Western Union Company are requested to communicate with their assistants and each other with a view of arranging uniform hours for Sunday service.

MANAGERS are requested to observe, particularly and carefully, that clause in the Tariff Circular, concerning the rates to be collected upon all messages received collect from certain points on the Pacific coast.

MANAGERS in returning upon their monthly (No. 4) report, the receipts for, and the number sent of full rate and half rate messages, should consider as "full rate" all messages booked as such, whether one-half of tolls are uncollectible on account of "red" franks, or not; and should consider as "half rate," only night messages booked at half rates.

GREAT REDUCTION OF RATES.

Once more a radical and sweeping reduction in rates is announced by the Western Union Telegraph Company.

On and after February 1, 1873, all rates between stations upon the lines of the Company, where they exceed two dollars and fifty cents for ten words, will be reduced to that sum. Heretofore the maximum rate has been six dollars. Upon messages sent collect, however, originating at certain points upon the Pacific Coast, where specie is the standard medium of exchange, and sent to any part of the country where the standard currency is paper, there will be an additional charge of twenty-five cents for ten words and one cent for each additional word. This is intended to protect the Company from the loss occasioned by the difference in value of the depreciated currency and also to partly compensate for the trouble in collecting the money. This extra charge is only upon business originating at the points specified and passing in the direction indicated.

The public will doubtless appreciate this additional evidence, that the policy of the Company now, as in the past, is to keep the rates only at a paying standard, and that as rapidly as the increase of business will warrant, just so soon will the rates be reduced. This fact, however, has never been called into question by those whose necessities compel them to use the telegraph.

THE American District Telegraph Company advertise this week for good line men.

GOLD MEDAL OF HONOR AWARDED TO JOSEPH B. STEARNS.

The American Institute has awarded to Joseph B. Stearns the Institute Gold Medal of Honor for his great invention of the Duplex Telegraph. The honor of this award, so justly bestowed upon Mr. Stearns, will be duly appreciated by all who are acquainted with the pre-eminently high position of the American Institute, and also from the fact that only one Institute Gold Medal of Honor is awarded during the year, and none, unless for an invention of paramount importance.

MR. GEORGE B. PRESCOTT, Electrician of the Western Union Telegraph Company, and Gen. Thomas T. Eckert, General Superintendent of the Eastern Division, have been commissioned to visit Europe, to examine the latest improvements in the telegraphic service there. They will give especial attention to the employment of pneumatic tubes, which are being used in London and other places, in connection with the telegraphs for the transmission of messages between the offices in the large cities, and also thoroughly examine the system of underground lines.

The Western Union Telegraph Company has, for the past seven years, been striving by the improvement of its lines and machinery, and by the employment of the most skillful operators, to secure the most prompt and satisfactory telegraphic service in the world, and we believe the results satisfactorily show that it has fully succeeded. Any improvements, however, in any branch of the telegraphic service which may be found to exist on the other side of the Atlantic, will be promptly introduced upon the lines of the Western Union Company.

Messrs. Prescott and Eckert will sail in the steamship "Parthia," of the Cunard line, on the 12th of February, and will probably be absent about two months.

Mr. J. B. Stearns also leaves on the same steamer for the purpose of introducing his Duplex Telegraph in Europe.

By authority of the Executive Committee of the Western Union Telegraph Company, Dr. Norvin Green, of Louisville, Ky., has been designated Acting Vice-President of the Company, to fill the vacancy occasioned by the resignation of Judge Palmer, which was recently announced in the JOURNAL.

Few men are better known in telegraph circles than Vice-President Green, who brings to the position he now occupies a ripe experience and familiarity with the details of the business which can not fail to materially advance and maintain the best interests of the Company. He has only resumed duties and responsibilities with which he has been long familiar, having probably an older experience in the management of Telegraph Companies than any other now in executive authority, commencing with the control and management of the New Orleans and Ohio Telegraph Lessees in 1854, and soon after President of the South-Western Telegraph Company, which in 1865, he stocked into the American Company, of which he was Vice-President until the grand consolidation in July of 1866, with the negotiation and settlement of which he was a leading actor. He has been a Director ever since the consolidation; and a Vice-President in active service up to the beginning of 1870, when he retired to take the Presidency of the Louisville, Cincinnati and Lexington Railroad Company. His railroad having been absorbed by one of the Great Eastern lines, the Executive Committee promptly availed of the opportunity to secure his return to take part in the onerous duties and responsibilities of the executive management of the Western Union Telegraph Company. He entered upon duty about the 20th of January.

TRICKS OF POSTAL TELEGRAPH ADVOCATES.

The *Daily National Republican*, whose editorial in answer to our criticisms upon the Postmaster-General's report we answered in our last issue, declines to publish our refutation of its incorrect statements, but instead pretends to produce extracts from our reply which sustain the position previously taken. We submit a few of these so-called extracts from our article, to show what kind of tricks the advocates of the postal telegraph resort to to sustain their cause. We quote from the *Republican*:

"The JOURNAL says 'dead-heads are properly included under paid messages because the Western Union Telegraph Company *paid for them*,' and then says, 'the *receipts* for these messages were included in the receipts for the transmission of messages.' This contradictory statement puzzled us, as we could not understand how a sum paid out could be a portion of the receipts."

Now, the following is exactly what we did say:

"The 660,203 partially paid and free messages were not all 'dead-heads,' as assumed in the *Republican's* calculations, *but were paid for at an average compensation, in cash, considerably greater than that derived by the company for the transmission of the Governmental weather reports.* The receipts for this class of messages were included in the receipts for the transmission of messages, so that there is no reason for excluding them from the number of messages sent in arriving at the average rate charged.

We said nothing about "dead heads being properly included under paid messages because the Western Union Telegraph Company paid for them," and the pretended quotation is a sheer fabrication, to which the inverted commas were added for the purpose of making it the more readily believed. We quote from the *Republican* again:

"The JOURNAL also says that we were, perhaps, correct in including so much of the receipts from other sources as was derived from the gold premium on cable dispatches, but as they do not tell us what portion came from other sources we cannot deduct any portion thereof."

This is what we did say: "The question whether the premium on gold, remaining in the company's hands after settling with the Cable Companies, should be regarded as forming a portion of the "receipts for the transmission of messages," might perhaps, be open to discussion, but, as the amount would only make a difference of a fraction of a cent in the average rate, it is scarcely worth considering. The dividends on stock owned by the company cannot, however, in any way, be construed into receipts for the transmission of messages."

Digitized by Google

We will make but one more extract from the *Republican's* article, which reads much more like the lucubrations of the young man who manufactured statistics for the Postmaster-General's report, than the emanations of the editor of a respectable newspaper.

Says this *veracious* writer :

"In our estimate we did not deduct the receipts from market and weather reports, because the letter of the President of the Company to the Postmaster-General said that the paid, dead-head and press messages included everything but railroad and service messages."

The short answer to the above is, that it is not true. The President's letter to the Postmaster-General said nothing of the kind, as the readers of the *Republican* can easily ascertain by referring to the letter in question, published in the pamphlet entitled "The Relation of the Government to the Telegraph," copies of which can be had at the office of the Company in Washington.

The *Republican* says that the JOURNAL is wrong in deducting the amount paid other lines and uncollectible, from the receipts of the Western Union Company, as these sums were all paid by the public for the transmission of messages. This is absurd. How can an amount which is uncollected be an amount paid by anybody? And, if this Company receives a sum of money to be paid over to a connecting line, how can such sum be reckoned as a portion of the receipts of the Western Union Company? Such misrepresentation and petty quibbles are beneath criticism, and if the advocates of postal telegraphy have nothing better to rely upon, their cause is too weak to stand alone, and will topple over from its own imbecility.

Within the past few years the practice of making and receiving gifts, has become very prevalent among all grades of employés of the telegraph companies. This custom we regard as very objectionable, and its continuance must inevitably prove demoralizing.

We do not question the fact that the recipients of the gifts are entirely worthy of the esteem which the presentation of such tokens of regard indicate that the donors entertain for them, nor that those who give them do so from the best of motives, but the custom is one, nevertheless, which ought to be discountenanced, because it lays the motives of both parties open to suspicion. All who take part in these presentations doubtless do so from generous motives, but many cannot afford this manner of gratifying their feelings. To such the matter becomes a positive hardship. Let us consider this question from one of the various points, in which it may be viewed.

Some person in an office, or upon a line; having what is commonly termed, an ax to grind, sees his way clear by engineering a presentation to an official whose good will it is necessary to propitiate in order to carry out the design he has in view. Advantage is taken of the popularity of the official and the esteem felt toward him by his subordinates, which generous sentiment becomes, as it were, embodied in the person most active, thus placing the recipient under a personal obligation to the one who has, apparently, done so much to cause honor to be paid to him. It is, perhaps, too much to expect from the average official about to be complimented, that he would evince moral courage and self denial sufficient to discourage the movement ; or to decline the gift ; such evidences of appreciation are too valuable in the sight of human nature to allow of this course, yet several instances have occured within our own knowledge where high toned officers of the Western Union and other telegraph companies, when they became aware of a contemplated testimonial, sternly discountenanced the movement, and when matters had progressed so far that the articles to be presented were already procured, refused the proffered gift. The effect of this course was to strengthen the official and personal relations between the parties.

With regard to those who cannot afford the luxury of such indulgences, it is a fair inference that they subscribe toward a testimonial, either from a sentiment of pride, in not allowing themselves to be outdone by their fellows in a manifestation of this nature, or from an ignoble apprehension of the consequences in case of refusal. Of course, it is not to be supposed that this fear has any foundation in fact, but with many it certainly exists, and has its influence.

The good taste of these presentations is also questionable, and did no other cause exist, this alone should be sufficient to prevent such manifestations. We have no inclination or desire to set up a standard for good taste, but it must be evident, that to receive a present where no equivalent can be made, save at the expense of official trust, is not strictly in accordance with the ordinarily recognized standard of self respect.

Pecuniary embezzlement is not the only manner in which official trust may be abused. The relations existing between officer and subordinate, in order that the interests of their common employer should be maintained and advanced, should be based upon reciprocal sentiments of respect and esteem; but so surely are the inclinations and judgment of individuals warped, either by gratitude to those who give or by a quasi-resentment toward those refusing to give, if any such there be, that this condition is violated. The recipient of a gift under these circumstances, becomes necessarily under a moral obligation toward the donors, and this fact has a tendency to influence a state of loose discipline, injurious to the service.

Our remarks are not intended to be condemnatory, nor as a reflection upon the motives of any. In our great desire to elevate the service, we have simply endeavored to point out the demoralizing influences growing out of the custom of gift presentations, and thus to discourage as much as possible, a growing evil.

As a means tending to that end, the JOURNAL, henceforth, will not record these events, unless it be as a token of respect and esteem to one vacating office, or leaving the business, when no taint of suspicion can be attached to the motives of any. In such a case, the JOURNAL will gladly do its part in rendering honor to the deserving.

A TELEGRAPHIC Employment Bureau has been established at Toledo, Ohio, at the head of which are several well and favorably known Superintendents of Telegraph. An institution of this character is a novelty in the telegraphic business, and it is to be hoped that the merits of deserving telegraphers, who may wish to better their condition, may, by the means of this bureau, be brought to the notice of those who, while in need of such service, might otherwise have remained in ignorance of its existence. See our advertising columns.

IN another column of this paper, Messrs. L. G. Tillotson & Co., inform those of our readers who may be in need of goods in their line, that they are ready to supply them with all kinds of telegraph supplies of the best quality and manufacture. The Le Clanché battery is their new specialty.

NEW YORK, NEWFOUNDLAND AND LONDON TELEGRAPH CO.,
NEW YORK, 14th January, 1873.

CYRUS W. FIELD, Esq.:

Dear Sir : I have the pleasure to hand you the following copy of a preamble and resolutions which were unanimously passed at a meeting of the Board of Directors of this Company, held this day :

"WHEREAS, the principal office of this Company is to be transferred to London, and the present Directors, excepting Mr. Field, are about to retire from the places which they have filled for nearly nineteen years ; and

WHEREAS, during all these years Mr. Cyrus W. Field has been associated with them in the direction, and it is to him that the organization of this Company is mainly due ; and

WHEREAS, he has labored in its service with zeal and diligence hardly ever equaled, and with a success great even beyond our expectation ; therefore it is

Resolved, unanimously, That Mr. Field is entitled to the warmest thanks of the Directors and Stockholders of this Company for his extraordinary labors in their behalf, and none the less that in their performance he has won a reputation co-extensive with the civilized world.

Resolved, further, That a suitable service of plate be prepared at our individual expense, and presented to Mr. Field, as a testimonial of our esteem, and in recognition of his invaluable services to this Company."

I remain, dear sir, very resp'y, yours,
(Signed) E. F. HATFIELD, Jr.,
Sec'y.

NEW YORK, January 15th, 1873.

E. F. HATFIELD, Jr., Esq., Secretary of the New York, Newfoundland and London Telegraph Co.:

Dear Sir : I have the honor to acknowledge the receipt of your letter of the 14th inst., containing resolutions unanimously passed at the last meeting of the Board of Directors of the New York, Newfoundland, and London Telegraph Company.

For the generous appreciation of my labors in behalf of the Company, expressed in the resolutions, the Directors have my sincere and heartfelt thanks.

For a period of nearly nineteen years, I have been associated with them, and have always found them earnestly and cordially co-operating for the accomplishment of the enterprise of establishing telegraphic communication between the Old and New Worlds, originally resolved upon at my house, on 10th March, 1854, after four consecutive evenings of consultation.

Of our struggles and disappointments through many weary years I need not speak ; they are fresh in the recollection of us all. During all this period, the Directors, consisting of Messrs. Peter Cooper, Moses Taylor, Marshall O. Roberts and Wilson G. Hunt, labored with untiring zeal for the successful accomplishment of the enterprise, without compensation for their services.

Though my connection with them as Directors is severed, I shall never forget their uniform kindness to me through the whole period I have been associated with them. And that God may bless every one of them will ever be my earnest prayer.

I remain, dear sir,
Very truly your friend,
(Signed) CYRUS W. FIELD.

GALVANIC BATTERIES.

(By the Rev. H. Highton, M.A.)

I shall not attempt to give any ultimate explanation of the phenomena of galvanism. It appears to me that it is true wisdom in science not to attempt to do more than to give an intelligent and comprehensive classification of the phenomena themselves. Deeper theories may sometimes be useful in suggesting experiments, if it be borne in mind that those theories must always be doubtful, and mere matters of guess, and at best, simply provisionary. Thus Maxwell has shown that the laws of hydraulics may be applied to electrical currents, though he cautiously and wisely guards us against supposing that it follows from this that there is any real electric fluid similar to ordinary fluids. It would have been well if other well-known scientific men had been content to follow his example. In the same way I should object to the assumption of any ultimate theory of galvanism, beyond the mere intelligent and classified expression of the laws of the phenomena.

In the kindred subject of heat, I think great injury has been done by asserting that it is "a mode of motion," which has introduced many wild and visionary ideas. If the word "motion" be meant simply as a translation of a Greek word, which includes nearly all kinds of change, and it also be meant that a change of temperature is a mode of motion in the ordinary English sense of the word, the assertion is, in a certain sense, true, but deceptive; if it be meant that simple heat, without change of temperature, is motion of any kind, this is not only extremely doubtful, but, I believe, absolutely untrue.* With regard to galvanism, then, I would merely say that it would appear that whenever there is a chemical there is also a galvanic action, which only requires proper arrangements to be made for exhibiting it.

Perhaps the simplest method of producing a galvanic current is by the formation or decomposition of water. That, if we have two plates of platinum, the surface of one of which is covered with a film of hydrogen, and the other with oxygen, on making a metalic connection between the two, a galvanic current passes, and the hydrogen and oxygen unite and form water. Conversely, if we take two metals, one of which has a greater affinity for oxygen than the other, and place them in water, then, on metallically connecting them, the water is separated into oxygen and hydrogen, the oxygen uniting with the more oxidisable metal, and the hydrogen being evolved on the surface of the other metal, and a galvanic current flows. I will show you both these actions by actual experiment. In both cases one pole of the battery is said to become positive and the other negative, and the action passing between the two is commonly called a galvanic current.

Take, again, the simplest of all forms of a galvanic battery—zinc and carbon, with a dialyte, as it is called, of dilute sulphuric acid between them; the oxygen of the water unites with the zinc, and forms oxide of zinc; the sulphuric acid unites with the oxide, and forms a sulphate of zinc, and hydrogen is evolved on the surface of the carbon. This double chemical action gives rather more electricity than the single action, as you see.

Now, it is a well-known fact that chemical combinations frequently produce heat, and it is also a well-known fact that an electrical current in passing through a homogenous conductor also produces heat; and it is an exceedingly interesting problem to ascertain what relation the heat of the chemical combination bears to the heat produced in the conductor of the current. An investigation of this kind requires the most delicate and expensive apparatus, much more delicate and expensive than I possess; but in searching into the records of the most trustworthy experimenters on this point, and comparing the results obtained by them, I have arrived at the following conclusions:

1. That, in all cases of galvanic action, the heat evolved in the battery, plus that in the exterior circuit, is exactly equal to the heat produced by the chemical action.

2. That, in most cases, a certain portion of that heat is retained exclusively in the battery, besides what is due to the internal resistence of the battery, and is not transmitted through the circuit.

3. That the potential of the battery varies, not only with the total chemical heat produced, but also with the proportion which that part of the heat which is transmitted through the circuit bears to the total chemical heat produced by the action of the elements of the battery. Indeed, the potential of a battery is exactly proportional to the amount of heat transmitted through the circuit by each unit of the atomic weight of the metal or other substance consumed or chemically changed. Thus, if we take two batteries, one of zinc, sulphuric acid or carbon, and another of zinc, sulphuric acid and copper, the heat evolved by the sulphoxidation of the zinc is the same in both cases; but the potential of the former, and consequently the heat evolved in the circuit, is greater;—what becomes of the difference? Is the heat in some mysterious way lost? No; the surplus heat is not evolved in the circuit at all, but remains in the liquid of the battery, useless for the production of electricity. Now, it is an exceedingly remarkable circumstance that the only battery yet examined in which the whole of the heat produced is transmitted throngh the circuit, is that form of the Daniell's battery in which zinc, in a solution of sulphate of zinc, is used for the positive, and copper, in a solution of sulphate of copper, for the negative, and in which the sulphuric acid and oxygen are transferred from the copper to the zinc.

With zinc, strong sulphuric acid, and platinum, about five-sixths of the heat produced is transmitted through the circuit, but this varies somewhat with the strength of the acid; with iron in sulphate of iron and copper in sulphate of copper, only about two-thirds are transmitted; with copper in nitrate of copper, and silver in nitrate of silver, about 39-82. In this way we account for the circumstance that, with the same positive metal, the potential varies with the character of the negative metal, less of the heat of the oxidation of the positive metal being transmitted through the circuit, and more retained in the battery itself. I may as well say that I obtained these results by comparing some well-known experiments of M. A. Favre, with some very important ones of M. Soret, which are scarcely known at all. I will illustrate this by showing you the amount of current derived from the oxidation of iron in conjunction with carbon, silver, and copper respectively.

But the whole subject of the relations between heat and electricity is one which requires deep and accurate investigation. M. Favre, in France, and Dr. Joule, in England, are the principal experimenters on this subject, and having spent very much time in carefully examining the published records of their experiments, I have no hesitation in saying that the conclusions they deduce cannot be accepted till they are repeated and varied with the most careful precautions, either by themselves or by others. It is much to be regretted that the committee of the British Association appointed three years since to investigate and report on the question in which these points are involved, and since re-appointed from year to year, have not yet made public a single syllable by way of report as to their proceedings or conclusions.

I will only make one observation more before I leave this part of my subject, and that is, that chemical actions which produce cold create a galvanic current, and therefore produce heat, as much as those actions which primarily produce heat. Thus, copper and carbon, acting on water, produce a current exactly the same in kind as zinc and carbon, although the heat produced by the oxidation of copper is less than the cold produced by the separation of the hydrogen and oxygen of the water. Again, you will see that while the combination of sulphuric acid with water, which produces heat, produces a galvanic current, the combination of acetic acid and water, which produces cold instead of heat, produces also a galvanic current of exactly the same kind as the combination of the sulphuric acid and water. Let me then show you these facts by actual experiment. And I may note, by the way, that it is a curious circumstance that the combination of many acids and other substances with water, while they produce a contraction of volume, at the same time produce cold, not heat. In the combination of an alkali with an acid, which also produces much heat, you will see that a strong galvanic current is produced, and in this case the alkali, like the water in the former case, acts as the positive, and the acid as the negative. These circumstances, with many others, illustrate the fact that the view of heat as given in Tait's "Thermodynamics" and other better known treatises, namely, that there is a certain absolute zero of temperature, fixed at—272 C., where heat finally ceases to exist, (just as there is a certain absence of motion when a body is at rest), and that all heat above this point is equivalent to a certain amount of mechanical force, is a view utterly erroneous; that, on the contrary, any variation of temperature, either upward or downward, involves mechanical force, and that the true zero of temperature is, when all contiguous bodies are of equal temperature, just as the true electrical zero is when all contiguous bodies are of an equal medium of electrical tension

But I now turn to the more practical view of the subject. And here let me begin by saying that, in order to understand practically the action of a battery, the most essential thing of all is thoroughly to understand what is called Ohm's law. I have no hesitation in saying that the discovery of Ohm's law was to electricity not a whit less important, indeed, I should say more important, than Newton's law of gravitation in astronomy and general physics; in fact, it has been like the rising of the sun to travelers groping their way in darkness. It is now, of course, universally acknowledged as the great law of electrical action, though, I need hardly say, that when first announced, it was received by the scientific men of the day with the utmost scorn, and actually denounced as the wild ravings of a madman. But Ohm was then an unknown man—now his name is a household word with all electricians. This great law then is, that the quantity of electricity passing through each part of a circuit in a given time is proportional directly to what is called the potential or electro-motive power of the elements, and inversely to the total resistance of the circuit. Thus, to express it algebraically,

(To be continued.)

* Aristotle, in his "Physics," suggests an important principle which might with advantage be studied by our modern theorists on the subject of heat. He says ("Physics" V., 1, 5.) "But perhaps whiteness is not a mode of motion, but whitening is;" so by analogy heat and cold are not modes of motion, but heating and cooling are so—that is in the Aristotelian sense of the word.

Address of

LECLANCHE BATTERY COMPANY,

No. 40 West Eighteenth Street.

F. L. POPE & CO.

Manufacturers and Dealers in

Telegraph Instruments and Supplies

OF EVERY DESCRIPTION,

194 Fulton Street, New York.

New and Superior patterns of

STANDARD TELEGRAPH INSTRUMENTS,

Their RELAYS, SOUNDERS, and KEYS which have been specially designed by Mr. F. L. Pope, are elegantly designed, thoroughly well finished and scientifically adapted to the service required and are recommended as SUPERIOR TO ANY HITHERTO OFFERED.

In addition to ALL DESCRIPTION OF TELEGRAPH MATERIALS AND THESE SUPPLIES are furnished, such as

INSULATORS, BATTERIES,
INSULATED WIRES,
CHEMICALS., ETC, ETC.

MAGNETIC AND DIAL INSTRUMENTS.

We have for sale also THE NONPAREIL TELEGRAPH INSTRUMENT for amateurs, learners and short lines.

A COMBINATION SET, comprising Sounder and Key on a handsome rosewood base.

Bradley's Box Relays and Sounders,
Bradley's Apparatus for Electrical Measurement.
Bradley's Naked Wire Helices and Magnet Spools to order, any desired size and resistance, at manufacturers' lowest price.

Descriptive Circular and Price Lists forwarded upon application to

F. L. POPE & CO.,

TELEGRAPHERS' EMPLOYMENT BUREAU,

TOLEDO, OHIO.

A Telegraphers' Employment Bureau has been established in this city, under the direction of several well known Telegraph Superintendents, having for its object the reception of applications for positions as operators, or operators and clerks or agents combined.

Applicants must state:

1st—Age. How long in the service. Reason for changing position. Present Salary. Sound or paper reader. Able bodied or otherwise.

2d—Applicants must send recommendations from present employer, or if not at work, from former employer as to moral character and capabilities. Recommendations to state if applicant is capable of filling positions other than operator, such as ticket agent, freight clerk, or agent.

This list will be published monthly and forwarded to the Superintendents of Telegraph Lines and a copy sent to each applicant whose name is printed thereon. All names to be published two (2) months. All applications to be accompanied by a fee of two (2) dollars.

Address,

Telegraphers' Employment Bureau,

TOLEDO, O.

THE

ELECTRIC RAILROAD SIGNAL CO.

SPECIAL NOTICE.

OFFICERS OF RAILROAD COMPANIES, and others interested, are notified that this Company is the sole owner of the ORIGINAL PATENT for operating

ELECTRIC SIGNALS

by including a section of a railroad track in the electric circuit, which was issued to F. L. POPE, July 16, 1872. Railroad Companies are **CAUTIONED** against negotiating with unauthorized parties for the use of this Invention, as this Company will take legal measures to protect themselves against all **INFRINGEMENTS.**

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 6. NEW YORK, FEBRUARY 15, 1873. WHOLE NO. 127.

THE CONDENSER.

The Condenser is an apparatus, by means of which a large quantity of electricity can be gathered on a small surface. Its form may be greatly varied, but the essential parts consist of two good conductors, which are separated from each other at a small distance by a non-conductor.

For the conductors there are ordinarily taken two metallic plates, A B C D. (fig. 1) between which, as a non-conductor, there is a stratum of air, or still better, a glass, caoutchouc or gutta-percha plate E F. When one of the metallic plates, A B, is connected with an electric body R, such for example as the positive conductor of an electrical machine, or some other source of electricity, and the other plate C D, by means of a wire, with the ground, then the + E of R is communicated to the plate A B. If the plate C D were not there, the quantity of electrity on A B would depend on the amount of surface of A B, and the tension of the prime conductor R. But the presence of the plate C D alters the case most

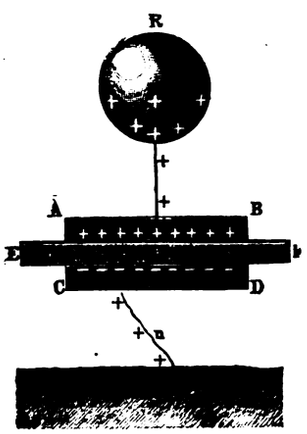

Fig. 1.

essentially. In the first place the electricity of A B cannot communicate with plate C D, owing to the interposition of the non-conductor E F. Consequently, the electric influence enters in exactly as in the case of static induction described in our last issue. The + E of plate A B analyses in the first place the plate beneath, attracts the—E, and repels the + E through n into the earth. But at the same time the — E of the plate C D is *bound* by the + E of plate A B; and the + E of the upper plate is also bound by the — E of the under plate.

Plate A B being at some distance from plate C D, the entire quantity of + E, which is present at A B, cannot hold bound an equal quantity of — E. The nearer both plates are brought towards each other the more — E can be bound by the + E of plate A B. For the same reason the bound — E of the under plate C D cannot bind an equal portion of + E of the upper plate, so that of the + E on plate A B, only a part is bound, and the other part is free. The bound + E on A B being so situated, as if it were not present at all at A B, is therefore called *latent* electricity, and thus it is only the smaller part of the free electricity of this plate which determines the electric tension. This tension, after the first passage of the + E from R to A B, is far less than it is at R, and thus a fresh quantity + E can pass on A B. However, almost the same thing occurs now that happened at the passing over of the first quantity of electricity from R on A B, namely, as at the very beginning the + E passed through n into earth, it becomes neutralized with an equal quantity — E from the ground, so that immediatcly on the first influence

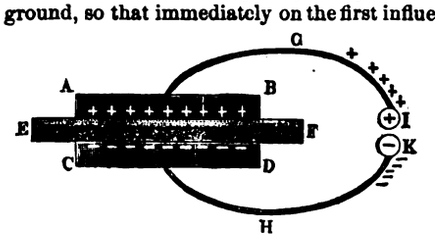

Fig. 2.

the derivation-wire n, as well as the plate C D and the bound — E, could supply the latter with fresh + E.

This + E becomes analyzed by the second + E, passing from R on A B; the — E of the under plate again becomes bound, and binds backward a part of the + E flowing from R, by which again a part of the latter remains free, and the electric tension on A B increases.

This process is constantly repeated until the tension on A B is the same as on R; when this is obtained, no electricity can pass from R to A B; at that time at A B a large quantity, comparatively speaking, of + E has gathered, and on C D likewise a correspondent but smaller quantity — E; of the former the greater part is bound by the — E of the plate C D, and even the latter is constantly bound by the + E of the plate A B. When this condition is entered upon, the condenser is charged.

When now the connection with R and the earth is broken, then at A B is present free + E and bound + E, the latter evidently in a state of heavy condensation, the under plate contains bound and con-

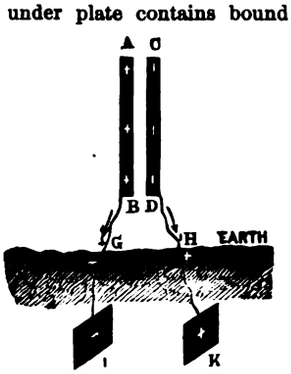

Fig. 3.

densed—E. Both bound electricities are attracted in an opposite way towards both surfaces of the non-conductor E F, and this attraction is so strong, that the electricities penetrate to a certain depth into the non-conductor E F.

When the source of electricity R is able to supply at each moment an infinite or exceedingly large quantity of electricity, its electric tension in charging the condenser does not decrease, and this charging follows almost immediately. When this is not the case, and the electricity is only produced by degrees at R, as in the electrical machine,—the condenser also only becomes charged by degrees, and the more rapidly, as the electricity on R is more rapidly developed.

When the charge has taken place, plate C D can be touched with the hand, without changing the condition of the charge, the — E of this plate being constantly bound, and consequently not able to be diverted. However, when the upper plate A B is touched, then, in the first place, the free + E of this plate is lead off to earth. The — E of the *under* plate, to whose binding as well the bound + E of the upper plate, as also the free + E of this plate is required, is kept only by the bound + E of the plate A B, and consequently cannot be kept constantly bound any longer; a part of this — E thus becomes free, and the rest remains bound. At present all + E on A B is bound; on the contrary all the — E on C D is partly bound, partly free.

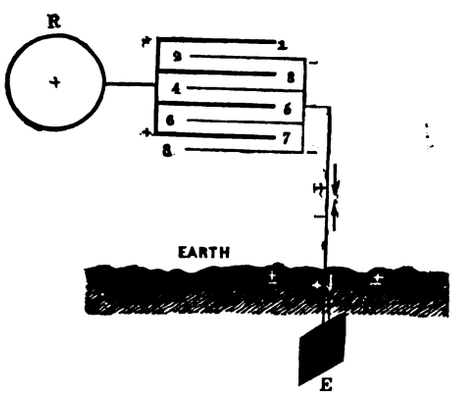

Fig. 4.

Now, if the under plate is again touched, the free — E becomes diverted; but even by this again a part of the + E on A B becomes free, — against which now all — E on C D is bound. Touching A B again, only the + E, which becomes free last of all, is diverted, by which again at C D a part of the — E becomes free.

When we continue in this way to connect plate A B and C D, one after another separately, with the earth, then the condenser becomes discharged by degrees. On the contrary, when the condenser, having been charged, and its connection with the source of electricity and the ground is broken, and its two conductors, G and H, figure 2, are connected with the plates A B and C D, and these conductors are brought near to each other by their extreme ends, I and K, then in the first place a portion of the free + E passes from A B to G; now all the — E cannot remain any longer bound on C D, a part thereof, consequently, becomes free

Digitized by Google

and proceeds to H. But the result of this is that the primitive quantity of the + E can not remain bound on A B any longer, but that rather a part of the + E which was bound heretofore becomes free at A B, and passes at G, and, as in consequence hereof, again a part — E, at C D, becomes free, and passes to H, accordingly at G I free + E, and at H K free — E is collected. The charge of the condenser plates decreases somewhat in consequence here of, and the tension of the opposite electricities at I and K becomes the stronger, the nearer the extreme ends I and K approach each other. When this tension has become considerable enough, in consequence of a nearer approach of I and K to overcome the resistance of the stratum of air, located between I and K' then both electricities become combined, and an electric spark is seen between I and K. Both electricities which were gathered at A B and C D, now unite through G and H, with almost inconceivable rapidity, so that between I and K only a single spark occurs, and the condenser is discharged at once.

When, instead of both conductors G and H, we take only one conductor, for instance, G, and lengthen this so far, that the extreme end I is near to the plate C D, then we obtain almost identically the same result. The same occurs when both plates A B and C D are connected by wires with the earth. In this case, a portion of the free + E of plate A B, figure 3, as heretofore, passes through G to the earth I; analyze there, however, the + E of the earth, and equalizes with the — E; by this process a correspondent part — E of the plate C D becomes free, the same passes over H to K towards the earth, and and there recombines with + E of the earth. In this manner, as we have explained heretofore, both electricities + E and — E of the plates, go to earth, and the condenser is discharged. In this case, it is usual to say that the electricities of the condenser flow off to earth, or the earth acting as a very large reservoir takes up or absorbs both electricities, but we ought instead to look upon the discharging not as a disappearing of the electricities out of the condenser into the earth, but as an equalization of its electricities with the opposite electricities of the earth. After the discharge, both plates A B, C D are not entirely devoid of electricity, as would be the case with a reservoir, when the latter had poured out its contents, but each plate is again saturated with a quantity of + E, adequate to the size of its surface. Upon a closer enquiry we find that the electricities are not gathered on the metallic plates A B and C D, but on both surfaces of the conductor E F, which are in contact with the metallic plates. When the condenser is charged, if plate C D, figure 1, is removed by means of an isolating handle, and the plate is examined, it will appear to be completely non-electrical; on the contrary, plate A B shows a small quantity of free electricity; when now these plates are separately touched and then again put together, as in figure 1, the condenser is found to be completely charged, and when discharged, produces a spark.

The electricities, however, not only adhere to the surface of the non-conductor E F, but they even penetrate, on account of their opposite attraction, to a certain depth into the surface of the non-conductor, and, when the non-conductor is very thin, they may unite again in its interior, and in this manner cause a discharge. Even this also is the reason why the condenser in discharging by means of both conductors G and H, figure 2, does not become completely discharged at once, but, after the first spark appearing between I and K, still remains slightly charged, and does not become discharged until I and K are again and again brought into contact.

The greatness of the charge of a condenser depends on the size of the surfaces of the non-conductor, with which the condenser plates are in contact, on the tension of the electricity in the body, which furnishes the charge, and on the distance of the metallic plates, or the dimension of the non-conductor, which is situated between them. If the electric tension in the body, which produces the charge, is small, then the metallic plates ought to be brought very near to each other; in such a case, the metallic plates are merely separated by a thin stratum of shell-lac, wherewith the surfaces of these plates, turned towards each other in juxta position, are covered.

The form of the condenser varies according to the end proposed with it. When a great deal of electricity is to be gathered with it, and the source of electricity is not large, not only the condensing metallic surfaces must be made very extended, but they should be placed very close to each other, without, however, coming in contact at any point. Sheets of thin glass or thin plates of mica or gutta-percha, covered on both sides within a short distance from the edge with tinfoil, are in many cases adapted to this end. When, however, the surface of the condenser is required to be so large that these contrivances will not suffice, leaves of thin paper, saturated with paraffin, and covered on both sides with tinfoil, must be used.

The leaves are then laid singly one upon another, like the pages of a book, and the tinfoil plates are connected together in two series, upper and under, each by themselves. In this manner two separate rows of metallic plates are formed, which stand very close to each other, but are separated by the non-conducting paraffin paper, and thus represent a large surface, without taking up much room.

Figure 4 represents such a condenser as is usually employed in operating the Stearn's Duplex Telegraph. The uneven numbers, 1, 3, 5, 7, indicate the four upper; the four even numbers, 2, 4, 6, 8, the four under tinfoil coatings of four paraffin leaves. When now one of the rows, for instance that of the upper tinfoil leaves, is connected with a source R of + E, and that of the under tinfoil leaves with the ground E, the condenser becomes charged in the manner above-described; the upper tinfoil leaves condense the + E; the under ones, the—E, and the collective quantity of electricity, gathering in the condenser may become very considerable, even with a feeble source of electricity R, if the latter flows a short time, provided a sufficiently large number of leaves are employed.

In the condenser employed by the Western Union Company for working long lines with the Duplex apparatus, condensers containing from fifty to one hundred leaves are used.

Origin of Electricity.—Dr. Louis Elsberg, of New York city, has communicated a new theory of the origin of electricity. According to this scientist, the number of vibrations executed by the molecules of an electrified body are between those of sound and heat, namely they exceed 38,000 a second, (at which point the cousciousness of sound ceases altogether), and are below 200 billions in a second.

Prof. Loomis's ærial telegraph whimsey is fair game for the newspaper wits, and it would be cruel to blame them for utilizing it. At the same time, there is a little danger in laughing too fast and too loudly at these crotchety scientific people. Mr. Anthony's remark in the Senate was suggestive, not to say sobering. "I never heard of a more absurd scheme in my life," he said,——"except the invention of Prof. Morse."—*Springfield Republican.*

GALVANIC BATTERIES.

(*Continued from page* 74.)

$$Q = \frac{E}{R'}$$

Again, the resistance of the circuit consists of two parts—the internal resistance of the battery, and the resistance of the rest of the circuit. Calling these R′ and R″, we have the equation,

$$Q = \frac{E}{R' + R'};$$

and in the practical comprehension of this equation, under the different circumstances to which it is applicable, consists the whole difference between a good and a bad electrician; everything as regards the relation between batteries, the work they have to do, and the cost of doing it, depends upon this equation. If we have many similar cells in a battery, say n cells, then the equation becomes

$$Q = \frac{n\,E}{n\,R' + R''}$$

Q represents the amount of chemical action going on in a given time in each cell, and if R″ be small, it is plain that, though with many cells we get many times the waste of zinc and other elements of the battery, we get no addition to the current; on the other hand, if R″ be large, we want a good many cells to produce the same current, and, in fact, as I said before, in the practical application of the equation to every varying case lies the whole art of the proper or improper use of a battery, and the art of using such batteries as are properly suited to the object desired to be attained.

It will be obvious, from what I have said, that the main points of merit in a battery are—

1st. A large potential, or electro-motive force.

2d. A small internal resistance, for where there is much internal resistance a large part of the power of the battery is wasted in itself, in overcoming—if I may so speak—its own friction. To these two points I may add two more, viz:—

3d. Constancy, or a power of keeping up an action nearly uniform.

4th. Permanency, or the power of working for a long time without attention or fresh making up of the battery.

When I say that the heat produced in a given time—and in some cases the magnetic power—is as the square of the quantity, and not simply as the quantity, you will see at once the great importance of having a large potential.

The two instruments I have here will serve to show the first three points in different batteries, namely, the potential, the internal resistance, and the constancy, for at least a short time. The permanency must, of course, be a matter of time to ascertain. The first instrument, a galvanometer with a large resistance, will, I think, show practically better than any other the potential of a battery. By either observing the degree of deflection with the same resistance, or the resistance through which the same degree of deflection is produced, we get a good practical idea of the potential of a battery. And this is really all we want; an exact theoretical determination is valueless, as it is always varying, more or less, from moment to moment.

I will now show you the practical potential of a large number of combinations. Let us take, as a convenient standard, zinc in sulphate of zinc, copper in sulphate of copper.

It is more convenient in practice, though a little larger than the British Association unit, which they call a "Volt," in which the negative is copper in nitrate of copper.

Digitized by Google

You see the degree to which it attains; now, let us compare with this the following elements:—

Zinc, dilute sulphuric acid, platinum.
Do. do. carbon.
Do. do. silver.
Do. do. copper.
Do. dilute sulphuric (‖) † nitric acid, platinum, (or Grove's form).
Do. do. (‖) nitric acid, carbon (or Bunsen's form).
Do. a mixture of dilute sulphuric and chromic acids, and carbon, without a porous cell, as recommended by Roscoe and Bunsen.
Do. dilute sulphuric acid (‖) carbon and mixed sulphuric and chromic acids.

I add a little permanganate of potash to the negative, and you see the potential raised a little. Now I will show you some forms of my own.

Zinc, solution of potash (‖) carbon packed in a mixture of carbon, precipitated sulphur, peroxide and of manganese with dilute sulphuric acid.
Zinc, common salt (‖) -- do. do.

Next what is in most respects, I think, the most convenient and best, and cheapest in action (for the power produced) of all batteries:—

Zinc, common salt(‖) --carbon packed in granulated carbon, peroxide of manganese, with a mixture of sulphuric, nitric, and chromic acids.

The potential of the first of these then is, as you see, very high, much higher than a Grove or a Bunsen—indeed, nearly fifty per cent. higher. The second and third also considerably higher; the third is very constant, very enduring, and, from the peculiar chemical action of the materials, emits none of those poisonous nitrous fumes which have so seriously and permanently injured the health of many who have used the Grove or Bunsen batteries. Now, we will try the potential of iron instead of zinc; this, you see, is about three-fourths that of zinc, so that four cells of iron will be about equivalent to three of zinc. But as iron is about one-third the price of zinc, and is much less likely to be affected by local action, it would seem as if there was great advantage in using iron. But as every pound of iron consumed will take a little more acid and manganese than the zinc (that is, in the proportions of eight and seven), and the internal resistance of four cells will be more than that of three, there is, on the whole, probably not much economy in using iron. Here is another battery in which no acid is used, and in which the potential is as high, or nearly as high, as a Grove, and very constant in its action. It is zinc, solution of salt (‖), carbon, and the peroxide of manganese, with a mixed salt of sodium, tin, and mercury. For telegraphic purposes, where the use of acid is thought objectionable, I know no better form.

But instead of zinc or iron, or indeed any metal, we may use any oxidisable liquid, and collect the electricity derived from its oxidisation by means of a carbon plate. The cheapest, probably, of all is common salt; you see this gives a very fair potential, in fact, not very short of a Daniell. Again, take sulphate of protoxide of iron, a very cheap material, which may be kept in a state of protoxide by placing in it pyrites or other sulphide of iron, which is a material almost valueless. Cyanide of potassium, you will see, gives a good potential; also hyposulphite of soda, and sulphide of soda or potash. You will observe that the potential of this is very much greater than a Daniell, and approaches that of a Grove. Sulphide of calcium—a waste material in many places—gives a very good potential. Again, brandy and water, sugar and water, milk, flour and water, all of which, being oxidised by the oxidising materials of the negative side of the battery, produce a considerable galvanic current. Indeed, with these kinds of materials the battery plays the same part as the stomach and lungs of the animal body, the negative part of the battery supplying oxygen to oxidise the food materials of the positive part just as the lungs furnish oxygen for oxidising the food supplied to the stomach and brought into circulation in the blood. You will observe that milk and tea are more easily acted on, and give a larger potential, than brandy and water or flour and water. But before I conclude this part of my subject I ought to show you the potential of some other forms of battery, namely, the Wollaston, the Smee, and the Le Clanché. You will see they are much inferior to some of the forms I have shown you, besides having other disadvantages which I shall show you in due time.

Well, let me next show you the internal resistance and constancy of some of the common forms of battery. In order to show this properly, we must, of course, take elements of an equal size. This instrument is a galvanometer of very small internal resistance, so that, practically, it shows you what is the internal resistance of the battery, as that is the main element of resistance. Of course the potential also affects the result, so that the degrees in this instrument will practically show you the combined result of potential and small resistance, where a large amount of current, with a small resistance is required; and the loss of power in a minute (I cannot afford to show you the effect of a longer duration) will give you some idea of their constancy.

Let us just take that modification of the Daniell now used in the Post-office and generally for telegraphic use. You have seen that it stands low in the scale for potential; and you will now see that for small internal resistance it stands very low indeed, but that its constancy for one minute at least is perfect. But still the amount of electricity produced in a minute is so very small that it ought to remain constant, there being so little expenditure of force in the time. Now, compare with this two forms of battery introduced by myself for telegraphic purposes—zinc in salt or dilute acid for positive, and carbon placed in granulated carbon and peroxide of manganese with dilute acid for negative. You will see the comparatively enormously large quantity of electricity which this produces; though in the course of a minute, where there is no resistance, it, of course, partially exhausts itself, the peroxide not being able to furnish oxygen rapidly enough for the supply; but, after a short interval of rest, it recovers its full potential. On the London and North-Western Railway ten of these cells were found to work to Manchester equally well with 60 of the ordinary sulphate of copper batteries; not of course, that the potential is six times as large—indeed, it is not more than double—but in damp and wet weather, where there is much leakage from the wires, the small internal resistance of these batteries enables them to supply enough electricity to make up for the leakage, whereas the larger internal resistance of the Daniell batteries prevents them from supplying in a given time more than a comparatively small quantity, which will not bear much loss from leakage. I am glad to say that this form of battery is being fast adopted for railway use. Then we try the Wollaston—a small potential, a small resistance, and a very rapid fall of power; then the Smee—a small resistance, fair potential, and in consequence of the rapid escape of hydrogen, considerable constancy. To this battery the hydrogen fumes are a great objection. Next, try the Le Clanché, a fair original potential, moderate resistance, and rapid fall of potential. Next, the form I mentioned before as introduced by myself, with a higher potential than the Le Clanché, and much more constant, though, like the Le Clanché, used without an acid, and therefore quite as permanent. It is simply a solution of common salt with a combined salt of sodium, tin, and mercury in the negative. This combination has the peculiar property of being able to extract rapidly the oxygen from the peroxide of manganese. The tin causes in time a little local action, but if it be left out, the mercury by itself cannot so rapidly extract the oxygen, and the local action caused by the tin is very small indeed. Next the "Grove," a high potential, very little resistance, even an increase of potential as the liquid gets warm; Bunsen the same; but both, after a short time, producing intolerable poisonous fumes, which produce dangerous inflammation of the lungs, take away the voice, and when a man's system has once been injured by them, act upon the lungs on subsequent occasions with the utmost rapidity. For myself, I am now so sensitive to them, that I cannot expose myself to them for even a few minutes without losing my voice and my chest getting seriously affected; besides they are far from permanent, as a few hours exhaust their power. Next, I try the bichromate battery, without porous cells: small resistance, high potential, but soon losing its power, and very expensive and wasteful in use, destroying itself by a single night's action. Next, the bichromate, with a porous cell, high potential, moderate resistance, moderate constancy, but very expensive in use. Next, let me take my own form, which for general practical use—as for induction coils, for keeping up a powerful magnetic action when required, and other such purposes—I think is far superior to all others. Zinc in salt, carbon packed in granulated carbon and peroxide of manganese, filled in with dilute sulphuric acid, mixed with a little nitric and chromic acids. Here is very high potential, as I showed you before, moderate resistance and great constancy. I have had them standing for months, used occasionally, and losing but little of their original potential.

For electro-plating, in power, convenience and long endurance, they exceed all others. Some electro-platers prefer iron as the positive, some zinc; for each has his own peculiar preferences and modes of working; but they are now becoming largely adopted, having more than the power of the Bunsen, without the inconveniences, and lasting, I may say, 30 times the length of time. Some electro-platers have had them in daily use for two months at a time. The chromic acid has the especially valuable property of absorbing all nitrous fumes.

To show you the power of the battery, here is a electro-magnet magnetised by a single cell. I will defy the strongest man in this room to separate the soft iron keeper from the magnet..

Where very great constancy and a very large current of electricity is not required, the nitric and chromic acids may be omitted, and then the local action becomes next to nothing; but with the latter a moderate-sized batttery of a single cell has been used for plating six dozen forks at once.

Some business men profess to believe that advertising is of no advantage to them. This is a mistake. Judicious advertising pays better than any other investment a business man can make.

† The mork (|) is intended to denote a porous diaphragm.

CORRESPONDENCE.

EXPERIMENTS DURING THE RECENT ELECTRICAL STORM.

To the Editor of the Journal of the Telegraph.

During the recent extensive storm, "atmospheric electricity," in considerable quantities, was developed on some lines. It was of sufficient strength to produce brilliant sparks and violent shocks, precisely the same as those experienced from the charge of a Leyden jar.

The line I experimented with was about one hundred miles long, running north-east, and fitted out with "lightning rods" for a part of its length. It was open and insulated at its north end, while the sonth end communicated with the ground.

Whenever the line was opened and closed, instantaneous currents were produced at the moment of contact, causing sparks, and strong magnetism in the relay magnets, though, at other times, no magnetism was perceptible. These currents were of varying intensity, sometimes producing almost a flame, which leaped over a considerable intervening space of air. When points of plumbago were interposed, and contact made with them, the light was of dazzling brilliancy.

When contact was made oftener than twice or thrice per second, the currents were weak, evidently requiring a second or two to attain full strength; longer time than this, however, made them no stronger.

The currents did not seem to interfere with working of the line, when the batteries were again connected, but rather aided it by causing the relay magnets to act with greater promptness, bringing the armature forward with great force at every contact. This seems to indicate that atmospheric electricity, when generally distributed along the entire length of a line, and not of too great strength, aids rather than hinders its working.

The "lightning rods" may also tend to produce static induction, similar to that of a Leyden jar, and cause a greater accumulation of electricity than would otherwise take place.

These currents were different from those produced by lightning—being less intense, and not as sudden, resembling somewhat those produced by the Aurora Borealis, but not as constant as the latter, and of intermediate intensity. A lightning-arrester had no power over them.

Not having access to a galvanometer, their strength or direction could not be determined.

J. J.

DISHONEST MANAGER OF A TELEGRAPH INSTITUTE.

WILMINGTON, Delaware, Jan. 28th, 1873.

A man named Chas. E. Wilkinson opened a "Telegraphic Institute" in a private house in this city, sometime during last Summer, and subsequently removed to rooms in the Masonic Hall, where, by delusive advertisements, &c., he induced some thirty or fifty persons to pay him $30 each, for three months tuition, during which period they were led to believe they would become competent operators, and failing to become so, terms to be $10 per month thereafter. He represented to quite a large proportion of his scholars that he had positions for them to which they were to go January first, 1873. The Christmas holidays arriving, Mr. Wilkinson thought it very proper to spend the joyous season among his old friends and relatives elsewhere, and has not yet seen fit to return; so that for some days following the first of January (the time for re-opening the institute,) the deluded scholars (both male and female,) were anxiously enquiring "Why don't he come?"

His rent for the room being due, the small outfit left by him was sent to the auction room, and sold under attachment of the landlord. But he had not gone away unprepared to repeat the swindle on some other unfortunate locality, for instead of finding the outfit of an institute, but one sounder and key, with a few battery jars, were left; so that it is not improbable that he is planning his nefarious scheme for further humbugging the innocent public at some other point.

W.

MEMORY.

To the Editor of the Journal of the Telegraph:

Telegraphing being a vocation which requires considerable of what may be termed mechanical action of the brain, a quick and retentive memory is one of its most necessary qualifications; for the operator must have the ability to use what he has learned without consuming any time hunting it up. Some are naturally gifted in this way, and for them it is easy to retain and apply what has been acquired; but others (those of us who upon consulting the looking-glass, find a slight depression in the forehead, over the root of the nose) acknowledge our deficiency as very troublesome and disheartening.

We must not, however, be discouraged, but set to work with brave spirits to supply the want. How can this be done? The answer is, practice, regular, every-day exercise of the faculty. How is the piano mastered? By untold hours of patient, monotonous drumming, until at last the fingers fly over the keys faster than conscious thought can follow them, and each note is a rounded harmony. In what way did all of us learn to read? Persistent, wearisome effort is the price paid for almost every acquirement worth having. Memory is said by mental philosophers to grow by using, quicker and easier than most other faculties; and those anxious to develop it will find so many ways of so doing that suggestions are scarcely needed; a few, however, may not come amiss.

It is a good plan to write every day some recollected circumstance, with the determination that a certain number of pages shall be filled within the year; or to make a list of all the people one has ever known, their complexions and temperaments. When evening comes, to live over again the events of the day, is excellent practice; and one who has never tried this will be surprised to find how hard it is to keep hold of the thread of events, even for one little day, and recall each trifling incident. A ruinous habit is that of running through a large amount of reading, allowing ideas to flash through the mind, and away, leaving apparently no impression; but they are making an impression; gradually wearing the memory as smooth as an old file, until after a while nothing will catch hold of it. Injudicious cramming is as bad for head as stomach, and will surely produce mental dyspepsia. The student who aims to develop memory should carefully avoid reading more than can be thoroughly understood, and at least in a measure retained.

Some readers, and perhaps you, Mr. Editor, may smile at my rambling ideas about learning to telegraph; but a good mechanic looks well to his tools, and will tell you that unless they are in order they will not do proper service. The brain is our workshop, and its many faculties our materials for mechanism; as they are cared for and educated, will our labors be crowned with success.

How happy the possessor of this faculty of recalling at will the treasures of knowledge which day by day are gathered on the journey of life; what he knows, can, when needed, be made to serve personal uses, and what he tries for is usually gained, for he holds one of the surest passports to success that can be given to the intelligent worker.

A.

REFITTING OF THE SAN FRANCISCO OFFICE, &c.

SAN FRANCISCO, Jan. 31, 1873.

To the Editor of the Journal of the Telegraph:

A peep into the newly enlarged and refitted operating room of the Western Union Company, in this city, shows one of the neatest, most comfortable and convenient offices outside of New York.

The room is about twenty feet wide by thirty-three feet deep, with a sunny exposure, and well lighted by three windows and a large, central skylight, which also gives excellent ventilation. The walls are hung with tinted paper, and wainscoated in imitation panels of walnut and oak.

The floor, which is laid in three-inch strips of selected wood, is varnished and polished.

The centre of the room is occupied by three handsome tables of the new pattern, made of highly finished walnut and oak, each table accommodating four operators, and the spaces divided off by plate-glass screens. Two smaller tables in the corners are devoted to stock printers, repeaters, &c. The manager's desk is at the rear end of the room. There are admirable arrangements for copying and distributing messages, and for conveying messages between the operating room and the receiving department.

The switch, handsomely framed, is at the foot of the room, and below it stands a large and beautifully finished tangent galvanometer and constant coil, for testing lines and batteries. This form of galvanometer was adopted because of its exceeding simplicity. Any operator can test all the wires in a few minutes, and record the deflections for each wire. He can judge at once, by comparison, of the working conditions of his wires, and the electrician subsequently works up the readings and records to the exact figures. The line wires are led in through the skylight, and between the roof and ceiling, to the switch, thence in cables, under the flooring, to the tables. The instruments are all new, and of the Electrical Construction Company's new pattern, and are, in point of neatness of design and finish, and in working efficiency, the best we have ever seen.

The local battery in use, devised by Mr. Field, and consisting of two cells, works the thirteen sounders, and could as easily work double that number. The current on each sounder is much stronger than with two cells of Daniell, and is constant and unvarying. The consumption of zinc and sulphate of copper does not exceed that of five cells of Daniell on short circuit.

Forty cells of Grove work the nine main lines, which are from 130 to 450 miles in length, and they work admirably.

The force in this department consists of Mr. J. S. Urquhart, manager; Messrs. C. P. Hoag and C. J. Thomas, day and night chief operators, and Messrs. John R. Youtz, George Sawyer, J. I. Sabin, N. H. Browne, A. L. Baker, John Campbell, C. Dwyer, John Foley, H. Vinton and T. S. Cunningham, operators, and a more efficient, willing and pleasant corps of men has seldom been organized. The same remarks will apply equally to the operating force at Sacramento, Reno and Virginia City.

The Superintendents of this Division express a just pride in the *personnel* of their operators, and the operators are too appreciative of the Company's kindly interest in them ever to suffer the present standard of efficiency to be lowered through any fault of theirs.

The Sacramento office is also to be refitted in a short time, and general preparations are being made to handle the increased business which the reduced rates and prosperity of the entire coast promise to the Company this year.

DUPLEX.

TELEGRAPHERS' INSURANCE.

To the Editor of the Journal of the Telegraph:

I find that the establishment of agencies is working well, especially in my territory. Many telegraphers never heard of the association, and those who have don't know how to become members. I enclose one letter from a number I have received, which speaks for itself, and I would state, for the benefit of others, that my way of procedure is to enclose a blank application with a letter briefly explaining the working of the association, to managers or operators who I have first ascertained to be worthy men, and requesting them to send me their applications. I succeed, because the aim and object is seen at a glance to be a good one.

I hope to live to give many a dollar to the loved ones those who *must* die will leave behind them, and I urge all good and true men to rally to our cause and so swell our numbers, that when death comes we may close the circuit willingly, and without a fear that those dear to us will suffer.

IOWA.

To the Editor of the Journal of the Telegraph:

PEORIA, Ill., Jan. 31st, 1873.

Noticing several accounts of fast work on the President's message in your paper, and noticing also that the Indianapolis spokesman wishes to know who can get a-head of their record, if the following is worth it, please publish.

The President's message, 11,335 words, was received over *one* wire in Peoria, Ill., office, between the hours of 8.30 and 10.45 P. M.—7 hours and 15 minutes—Messrs. Heaton, Dinsley and Whitcomb doing the work.

The Indianapolis time, 2.15 to 6.30 P.M., over *two* wires, equals 8 hours and 30 minutes over *one* wire; 1 hour 15 minutes longer than ours.

W.

RULE 54.

To the Editor of the Journal of the Telegraph:

Will you gently drop into the ear of "Chicago" a loud whisper, which shall arouse him to a continual (not irregular) compliance with Rule 54. Oh! the trouble and work he causes by his forgetfulness of this rule.

IOWA.

T. M.—The only complete volume of the JOURNAL we have is Volume V. This we can furnish, bound, for two dollars per copy. We have incomplete files of the other volumes.

H. B. D.—Without doubt, it is desirable that operators employed upon the lines in Mexico should have a fair knowledge of the Spanish language. But it is not essential.

J. C. C. —Good operators, or even those classed as fair, can always obtain situations. Address a letter to any of the Superintendents, a full list of whom we gave in our last issue.

THE PUGET SOUND TELEGRAPH COMPANY.

THE stockholders of the Puget Sound (Oregon) Telegraph Company held a meeting at Port Townsend on Monday, the 6th of January, at which the following gentlemen were elected trustees of the company for the year 1873; Cyrus Walker, D. C. Rothschild, Marshall Blinn, O. F. Gerrish and William Renton. At a subsequent meeting of the trustees, on Thursday, the 9th, O. F. Gerrish was elected President; Cyrus Walker, Treasurer, and Fred. Drew, Secretary.—*Daily Oregonian.*

FOREIGN TELEGRAPHIC ITEMS

FRENCH POSTAL TELEGRAPHS.—By special measures, concerted between the French Ministers of the Interior and of Public Works, an arrangement has been completed for the reception and transmission of private despatches from the telegraph posts established at the locks of canals and canalized rivers, a commencement being made with stations on the Burgundy Canal. This concession, however, is limited, as far as delivery is concerned, to despatches marked "Bureau Restant," *i. e.*, not forwarded, which seems to be a material restriction and reduction in the value of the arrangement for the service of the public.

THE decree granting a concession to a Spanish company to lay a cable between Cadiz and Cuba, with stations at the Canaries and Teneriffe, has been duly signed by the Spanish authorities recently.

THE company for establishing telegraphic communication between Lisbon and Brazil has been registered under the name of the "Brazilian Submarine Telegraph Company (Limited)," with a capital of £1,300,000, in shares of £10 each.

THE telegraphic communication now established between London and Sydney, Australia, is said to be a great success. It is, however, feared that the cable (already once broken) will cause some trouble, for half of its length is in deep sea, where it will probably encounter rough usage; the other half, however, lies in less than 100 fathoms water, and rests on a good bottom. The land line of 2,000 miles of wire, stretching from Port Augusta to Port Darwin, will doubtless involve a large expenditure annually for repairs, &c. The cost of a message at present renders private intercourse almost impossible, the price per word being 10s.

THE *Diario Official* of Bogota, of the 14th ult., announces that telegraphic communication was established between the capital of Cundinamarca and Sucre on the 13th of November last, and to the port of Buenaventura on the 10th of December.

THE traffic receipts of the Great Eastern Telegraph Company for December, 1872, amounted to £32,175—an increase of £9,913 on the corresponding week of the previous year.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ending January 4, 1873, was 256,035—an increase over the corresponding week of last year of 38,517.

THE directors of the China Submarine Telegraph Company have declared an interim dividend of 3s. per share for three months ended 31st of December, payable on the 31st of January.

ADVICES from Japan of December 23, 1872, state that a notice had been published that the telegraph line would be opened from Yokohama to Europe on the 20th of January, and that test messages had already passed through the cable.

TELEGRAPHIC communication is increasing throughout the colony of Queensland. A tender has been accepted for erecting a new telegraph line from Twenty-mile Creek to Stanthorpe.

THE PENSACOLA TELEGRAPH CO.

The Pensacola Telegraph Co. have just completed the extension of their lines to Milton, Fla., and this event was the occasion of much jubilation at that point.

DISCHARGE OF A LEYDEN JAR.

Professor Rood, of Columbia College, in a paper gives the results of some investigations "On the nature and duration and the discharge of a Leyden jar in the "*American Journal of Science and Arts*," connected with an induction coil. He summarises the general results as follows:—

If a Leyden jar of a selected size, with a fixed striking distance, be connected with an induction coil, the act of exciting the coil will charge and discharge it at once; as the size of the jar is diminished it will be charged and discharged oftener, and an aureol or violet discharge will begin to mingle itself with the spark of discharges, and as the size still further diminishes, will finally replace all of them except the first; for it is evident that we may regard two brass balls, with an intervening layer of air, a millimetre thick, as a minute Leyden jar, representing the last of the series. The combination of the aureol with multiple sparks is, I think, to be explained thus: the first spark heats and rarifies the air between the electrodes; if then the electric current is furnished with sufficient rapidity by the coil, the tension of the electricity in the jar may rise sufficiently for a discharge through the rarified air before it can cool down, and thus produce the violet light. This state of matters would continue till the electricity began to be furnished more slowly by the coil, when it would result that the air between the electrodes, having time to cool down, would no longer permit the electricity to pass through it in an unbroken stream, but would compel it to discharge itself in sparks. According to this idea, the successive sparks ought to be separated by a gradually increasing interval, and this indeed appears to be the case, the rise of the separating interval being particularly strongly marked towards the close of the total act. Brass balls favor this mixed form of discharge, perhaps, by confining the air to a certain extent, and thus preventing it from cooling down. Platinum points can have no such influence, and with them this phenomenon is rare. With the larger jar it never occurred, as the air was able to cool down before the electric tension had sufficient time to rise in its larger surface, so as to warrant a discharge. With the small jar and longer striking distances, the violet light was not produced for an analogous reason, and also, perhaps, because the air was less confined.

THE Boston *Globe*, which, as excluded from the Associated Press, is a warm advocate of the postal telegraph, said on Tuesday, referring to the reported assassination of the President:

Does any one suppose that such a ridiculous and disgraceful falsehood as the sensational report relating to General Grant, which was sent over the wires by the agents of the telegraph, on Saturday, could have thus been disseminated had the postal telegraph been in operation? Telegraphy should be in the responsible hands of the government, not in those of a money-making monopoly.

Is the veil withdrawn so soon? Does the *Globe* so readily acknowledge that the telegraph, when owned by the government, is to be subject to government censorship, *a la* France and Russia? We know that Mr. Creswell does not intend such a policy now, but we ask him to see whither his policy is likely to lead.—*Troy Daily Whig.*

A BILL has been introduced in the Assembly, at Albany, making it a misdemeanor, punishable by fine or imprisonment, for any person or persons, to affix in any manner, any show bill, hand bill, or other lettered, printed, or written notice or advertisement whatever, on telegraph poles and other structures within the limits of the city of New York, without first obtaining permission from proper authority.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
February 15, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Beaver Meadow, Ala., re-opened.
Covington, Ga., re-opened.
Caledonia, Ill., is in Boone Co.
Dawville, Iowa, should read Dowville.
Harrison Square, Mass., office now open, square 21; erase delivery charges.
The P. O. A. of South Dedham, Mass., is Norwood.
Hanson, Mass., changed to South Hanson.
Messages for Falmouth, Mass., should be sent and checked to Cohasset Narrows, Mass.
Quitman, Miss., closed.
Toombsuba, Miss., closed.
Triplett, Mo., closed.
Rochester, N. H., should read { 25 2 17 Great Falls, N. H. / 25 2 14 Portland, Me.
Maple Hill, N. Y., closed.
Hestonville and Park Drove Yards, Pa., closed. Business will hereafter be delivered from West Phila. Charges for delivery 25 cents.
Phillipsburg, Clarion Co., Pa., re-opened.
Now London, Pa., is in Warren Co.
Hallville, Texas, closed.

Steamers leave Santiago de Cuba for St. Thomas on the 6th, 9th, 20th and 25th; also Kingston on the 9th and 24th of each month.

NOTE.—In addition to the foregoing charges, the usual charge of $3.00 per message for steamer charges from Key West, Fla., on all Cuba cable business should be made.

ATLANTIC CABLE BUSINESS.

We are notified that the cable between Hong Kong and Shanghai is broken. Messages for places beyond Hong Kong, if via Falmouth or Teheran, must therefore be posted at Hong Kong.

WILLIAM ORTON, President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, Feb. 10th, 1873.

Maysville, Ky., office has been transferred from G. T. Williams' district to J. B. Tree's district.

G. H. MUMFORD, *Vice-Pres't.*

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS 37 & 38 UP TO FEBRUARY 12th.

The acknowledgment of receipt of any assessment is to be understood as an acknowledgment for all previous assessments.

For the benefit of a few who are unable to comprehend how it is—as per notices sent out February 1st—that the returns from assessment 36 are "for the benefit of the heirs of R. S. Raymond," and, at the same time, assessment 37 is occasioned by his death, we would explain that when a member dies his heirs receive the fund on hand, or in other words, the proceeds of the last assessment made previous to his death. Thus, in the case of Mr. Raymond, his heirs received the returns of assessment No. 36, which of course depleted the treasury, and No. 37 was called in order to make the fund good again for the next death. M. G. Chettle's heirs will receive the benefit of 37, and assessment 38 is ordered to make the amount good again in the treasury.

The following letter from our agent at Memphis, Mr. J. J. Fowler, gives the following particulars of Minah J. Chettle's death:

"He died of tubercular menigitis, at 3 A. M. Jan. 23d, aged twenty-four years. The disease manifested itself Dec. 1, and on the evening of the 2d he reported himself as being too unwell for duty. Thinking that his illness was but the result of a severe cold, and that the quiet and care of a few days rest would benefit him, he neglected calling in medical attention until his symptoms were of a serious character. From that time until the first of January his condition was critical. He then began convalescing. In his enthusiasm he imprudently exposed himself, producing a relapse on the 12th inst., which confined him to his room and bed, and terminated, after intense suffering, in death on 23d January. He was a steady, industrious and upright young man, and the fraternity has lost one of its best operators. While ill he received every attention from his relatives and associates. The money coming from the Insurance Association he directed should be paid to Mr. Wm. Chettle, of Water Valley, Miss."

Deaths come to us thick and fast. The regular announcements of the deaths of R. S. Raymond and M. J. Chettle had hardly been issued when we were pained to hear of the demise of another of our early members, Mr. Robert N. Norton, of Ironton, Ohio, which occurred on February first. His certificate, No. 422, was issued February 16th, 1869.

Mr. W. W. Pritchard, manager at Ironton, O., writes that Mr. Norton has been confined to his bed for about four months, from disease of the hip, which, it is thought, terminated in consumption. He was employed in the Catlettsburg, Ky., office until taken sick. He leaves a wife and babe, to whom the money accruing from assessment 38 will bring many blessings, as nearly all their means have been exhausted by the long sickness of the deceased.

ELECTROSCOPIC EXPERIMENTS.

The following article on "A Cause of Error in Electroscopic Experiments," by Sir Charles Wheatstone, extracted from the *Proceedings of the Royal Society*, is interesting, as it shows the necessity of great precaution in making experiments with the Electrometer :—

"To arrive at accurate conclusions from the indications of the electroscope, or electrometer, it is necessary to be aware of all the sources of error which may occasion these indications to be misinterpreted.

"In the course of some experiments on electrical conduction and induction, which I have recently resumed, I was frequently delayed by what at first appeared to be very puzzling results. Occasionally, I found that I could not discharge the electrometer with my finger, or only to a certain degree, and that it was necessary, before commencing another experment, to place myself in communication with a gas-pipe which entered the room. How I became charged, I could not at that time explain ; the following chain of observations and experiments, however, soon led me to the true solution.

"I was sitting at a table not far from the fireplace, with the electrometer (one of Peltier's construction) before me, and was engaged in experimenting with discs of various substances. To ensure that the one I had in hand, which was of tortoise-shell, should be perfectly dry, I rose and held it for a minute before the fire ; returning and placing it on the plate of the electrometer, I was surprised to find that it had apparently acquired a strong charge, deflecting the index of the electrometer beyond 90°. I found that the same thing took place with every disc I thus presented to the fire, whether of metal or any other substance. My first impression was that the disc had been rendered electrical by heat, though it would have been extraordinary that, if so, such a result had not been observed before ; but on placing it in contact with a vessel of boiling water, or heating it by a gas-lamp, no such effect was produced. I next conjectured that the phenomenon might arise from a difference in the electrical state of the air in the room and that at the top of the chimney ; and to put this to the proof, I adjourned to the adjacent room where there was no fire, and bringing my disc to the fireplace, I obtained precisely the same result. That this conjecture, however, was not tenable, was soon evident, because I was able to produce the same deviation of the electrometer, by bringing my disc near any part of the wall of the room. This seemed to indicate that different parts of the room were in different electrical states ; but this again was disproved by finding that when the position of the electrometer and the place where the disc was supposed to be charged were interchanged, the charge of the electrometer was still always negative. The last resource was to assume that my body had become charged by walking across the carpeted room, though the effect was produced by the most careful treading. This ultimately proved to be the case ; for, resuming my seat at the table, and scraping my foot on the rug, I was able at will to move the index to its greatest extent.

"Before I proceed further, I may state that a gold-leaf electrometer shows the phenomena as readily.

"When I first observed these effects, the weather was frosty ; but they present themselves, as I have subsequently found, almost equally well in all states of the weather, provided the room be perfectly dry.

"I will now proceed to state the conditions which are necessary for the complete success of the experiments, and the absence of which has prevented them from being hitherto observed in the striking manner in which they have appeared to me.

"The most essential condition appears to be that the boot or shoe of the experimenter must have a thin sole, and be perfectly dry ; a surface polished by wear seems to augment the effect. By rubbing the sole of the boot against the carpet or rug, the electricities are separated, the carpet assumes the positive state, and the sole the negative state ; the former being a tolerable insulator, prevents the positive electricity from running away to the earth, while the sole of the foot, being a much better conductor, readily allows the charge of negative electricity to pass into the body.

"So effective is the excitation, that if three persons hold each other by the hands, and the first rubs the carpet with his foot, while the third touches the plate of the electrometer with his finger, a strong charge is communicated to the instrument.

"Even approaching the electrometer with the hand or body, it becomes charged by induction at some distance.

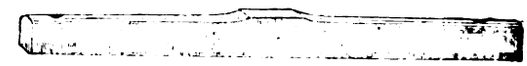
"A stronger effect is produced on the index of the instrument if, after rubbing the foot against the carpet, it be immediately raised from it. When the the two are in contact, the electricities are in some degree coerced or dissimilated ; but when they are separated, the whole of the negative electricity becomes free and expands itself in the body. A single stamp of the carpet followed by an immediate removal of the foot, causes the index of the electrometer to advance several degrees, and by a reiteration of such stamps, the index advances 30° or 40°.

"The opposite electrical states of the carpet and the sole of the boot, were thus shown : after rubbing, I removed the boot from the carpet, and placed on the latter a proof-plate (*i. e.*, a small disc of metal with an insulating handle), and then transferred it to the plate of the electrometer ; strong positive electricity was manifested. Performing the same operation with the sole of the boot a very small charge was carried, by reason of its ready escape into the body.

"The negative charge assumed by sole-leather, when rubbed with animal hair, was thus rendered evident. I placed on the plate of the electrometer, a disc of sole leather, and brushed it lightly with a thick camel's-hair pencil ; a negative charge was communicated to the electrometer, which charge was principally one of conduction, on account of the very imperfect insulating power of the leather.

"Various materials, as india rubber, gutta percha, &c., were substituted for the sole of the boot ; metal plates were also tried : all communicated negative electricity to the body. Woollen stockings are a great impediment to the transmission of electricity from the boots ; when these experiments were made I wore cotton ones.

"When I substituted for the electrometer a long wire galvanometer, such as is usually employed in physiological experiments, the needle was made to advance several degress.



"At the meeting of the British Association in Dublin in 1857, Professor Loomis, of New York, attracted great attention by his account of some remarkable electrical phenomena observed in certain houses in that city. It appears that in unusually cold and dry winters, in rooms provided with thick carpets and heated by stoves or hot-air apparatus to 70°, electrical phenomena of great intensity are sometimes produced. A lady walking along a carpeted floor drew a spark one quarter of an inch in length between two metal balls, one attached to a gas-pipe, the other touched by her hand ; she also fired ether, ignited a gaslight, charged a Leyden jar, and repelled and attracted pith-balls similarly or dissimilarly electrified. Some of these statements were received with great incredulity at the time both here and abroad, but they have since been abundantly confirmed by the Professor himself and by others. (See Silliman's *American Journal of Science*, July, 1858.)

"My experiments show that these phenomena are exceptional only in degree. The striking effects observed by Professor Loomis were feeble unless the thermometer was below the freezing-point, and most energetic when near zero, the thermometer in the room standing at 70°. Those observed by myself succeed in almost any weather, when all the necessary conditions are fulfilled. Some of these conditions must frequently be present, and experimentalists cannot be too much on their guard against the occurrence of these abnormal effects. I think I have done a service to them, especially to those engaged in the delicate investigations of animal electricity, by drawing their attention to the subject."

On the evening of the 12th instant, General T. T. Eckert, General Superintendent of the Eastern Division, was complimented by a dinner at the Astor House by the Superintendents of his division, as an expression of their kindly feelings toward him on the occasion of his contemplated departure for Europe.

IMPROVEMENT IN THE FORM OF CROSS ARMS.

All the cross arms used by the Western Union Company in future are to be rounded off upon the upper sides, and made slightly sloping toward the ends, so as the more readily to shed rain. The accompanying cut will serve to illustrate the plan

which has been adopted. Not only will this change improve the insulation of the lines, but it will greatly improve their appearance also.

Mr. D. W. Pitfield, lately station agent and manager W. U. Telegraph Company at Moncton, N. B., has been appointed chief operator and train despatcher for the Western and Central Divisions of the Intercolonial Railway. His headquarters are at Moncton, N. B.

Mr. Luther B. Archibald, manager W. U. Telegraph Company at Truro, Nova Scotia, has resigned, and takes the position of chief operator and train despatcher Eastern Division Intercolonial Railroad. Headquarters at Truro, Nova Scotia.

The Boston *Globe* is responsible for the following : Mr. E. D. L. Sweet, executive manager of the Atlantic and Pacific Company, says :—"The object of all conferences and consultations between the officers of the independent companies has been, and will be in future, as to how the telegraph business, as entrusted to them, can be most economically and *inefficiently* handled."

We don't believe Mr. Sweet intended to say inefficiently.

BORN.

Prichard—At Ironton, O., Feb. 1, 1873, to W. W. Prichard, Manager W. U. Tel. Office, of a son.

MARRIED.

Case—Morgan.—At Lafayette, N. Y., Feb. 5, 1873, in the M. E. Church, by Rev. A. R. Palmer, Homer Case, Manager W. U. Tel. Office, to Emma J. Morgan, all of Lafayette.

Kuenely—Kearins.—At Colfax, Cal., Jan. 20, 1873, Jacob Kuenzly, Manager W. U. Tel. Office, Colfax, Cal., to Miss Maria Kearins, of Providence, R. I.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, FEBRUARY 15, 1873.

ANOTHER REDUCTION IN CABLE RATES.

At a meeting of the Board of Directors of the Anglo-American and the French Atlantic Telegraph Companies, held at London, on Friday, 7th instant, and at a meeting of the Directors of the New York, Newfoundland and London Telegraph Company, in this city, on the day following, it was unanimously resolved to reduce the tariff on messages between New York and Great Britain, from one dollar to seventy-five cents per word, and between New York and France to seven dollars and fifty cents for ten words.

This reduction goes into effect on and after May 1st next.

In our issue of January 16, 1873, we had occasion, in answering a question from a correspondent, to point out the proper course to have been taken in the reception, at Ludlow, of a message directed to Boston, which message was an answer to one dated at Fitchburg. It appears that we have not been fully understood as to the course Ludlow should have pursued in the matter; and we learn further, from other correspondents, that it is an every-day occurrence, throughout the country, for messages to be received and forwarded in a similar manner; the Company thus taking the risk of collection. We think that our correspondents err in this showing, but if the statement is correct, it is time that a better understanding should be arrived at.

In this case, and in all similar cases, the proper treatment of the business would be for Ludlow to have exacted prepayment, or the equivalent, for the message offered as an answer, it being clear that, in the event of the Boston office being unable to find the party addressed, the tolls could not be collected there. The person had left Fitchburg, as was evident from the original message, therefore, Fitchburg could not collect.

The message from Ludlow to Boston was not an answer within the meaning of the rule, and but little reflection is required to arrive at that conclusion.

A SUPPLEMENTARY tariff sheet, which will contain all changes in rates which have taken place since the present tariff book was issued, is in preparation, and probably will be sent to offices some time in March.

PURCHASE OF THE CUBA CABLE LINES.

A meeting of the Directors of the Western Union Telegraph Company was held, February 8th, at which the action of the President in the purchase of stock of the International Ocean Cable Company was confirmed. This Company is known more particularly as the Cuba Cable Company, the termini of which are Havana and Key West, from which latter point it has land lines extending into the State of Florida, where it has connections with the lines of the Western Union. It will be remembered that a meeting was held on the 2d of June, 1872, at which the President of the Western Union was authorized to purchase sufficient stock in the Cable Company to secure control, and from time to time such stock was purchased as could be obtained, though not sufficient to attain the object aimed at. At a more recent date some strong parties, representing English capitalists, appeared in the market for the purpose of buying up the line, though, before action was taken by either of the parties, the Western Union people were fortunate enough to obtain 9,251 shares, thereby securing control of the company. The negotiation was completed on Monday last. According to the terms of sale, payment was to be made at once in cash, whereupon President Orton, after consultation with some of the Executive Committee, authorized on that date the sale of the 15,000 shares of Western Union stock owned by the Company. It should be understood that the first proposition was to pay for the stock of the International Ocean Telegraph Company in the stock of the Western Union, but the parties representing the former Company were unwilling to accept the stock at its then market quotation. This block of 15,000 shares was held as a part of the assets of the Western Union Company, purchased with the surplus funds of the Company with a view of using it in the extension of their lines whenever they should see fit. It will be seen by the resolutions below, that the action of the President in directing its sale on Monday met with but one dissenting vote:

Whereas, at a meeting held June 2, 1871, the President was authorized to purchase stock of the International Ocean Telegraph Company to such an extent as he deemed advisable for the interests of this Company; and

Whereas, the President, in pursuance of negotiations commenced under such authority, has agreed to purchase 4,612 shares of the preferred stock of the International Ocean Telegraph Company, and 4,639 shares of the common stock of said Company; and

Whereas, for the purpose of completing such purchase of stock and making payment therefor, the President, by and with the advice and consent of Messrs. H. F. Clark and Augustus Schell, directed the sale of 15,000 shares of the capital stock of this Company held by the Treasurer as a portion of its cash assets; therefore,

Resolved, That the action of the President in the purchase of said International Ocean Telegraph Company's stock be and the same is hereby approved, ratified, and confirmed.

Resolved, That the action of the President in directing the sale of 15,000 shares of the Company's stock, for the purpose aforesaid, be and the same is likewise approved, ratified, and confirmed.

The first part of the foregoing resolutions was adopted unanimously, and the second with but one dissenting vote.

THE Automatic Telegraph Company have an office in the Capitol at Washington; the transmitting apparatus is a Morse key, the receiving apparatus is a Morse relay and sounder, and as the operator has had some years experience upon the Western Union lines, we see no reason why he should not be able to send communications when the line is in working order.

SENATOR RAMSEY'S REPORT ON THE HUBBARD JOB.

We have been furnished with a copy of Mr. Ramsey's report in favor of the Hubbard scheme, by which Congress is asked to incorporate a Telegraph Company, and confer upon it the right to build and operate telegraph lines in all the States and Territories, and also to provide for a partnership arrangement with the Post-Office Department, by which the Company will be provided with office-room, stationery, light and fuel, and to some extent with clerks, operators, and superintendents, at the cost of that department.

Mr. Ramsey alludes, on the first page of his report, to the disastrous consequences attending the assumption of the telegraph by the Government of Great Britain, and accounts for them by the increase of business, which, consequent upon the reduction of rates, was so great that neither wires, instruments nor operators could be had sufficient to perform the business with despatch and correctness.

This explanation is undoubtedly true to some extent, and should serve as a warning to our Government not to rush heedlessly into the same error by inaugurating a system which shall reduce the rates before providing the proper facilities for satisfactorily performing the increased traffic which would ensue.

The increase in the traffic should not, however, have caused such disastrous consequences in England, because the increase in the number of messages there was not greater than here during the same time. The difficulty is due to the fact, that the Government officials did not comprehend the nature of the business they had undertaken, and properly provide in advance for both the natural increase of the business and that which should have been anticipated from the reduction in rates.

That there has been no such enormous increase in the business consequent upon the governmental absorption of the telegraphs as is claimed, is easily demonstrated. Mr. Ramsey says: Under the old system about 6,000,000 telegrams a year were transmitted; now 15,000,000.

Mr. Gardiner G. Hubbard, in his "Letter to the Postmaster-General on the European and American systems of telegraph, with remedy for the present high rates," printed for private circulation in 1868, states on page 29 that, during the year 1866, 6,127,000 messages were transmitted in England.

Sir Frank Ives Scudamore, the Director-General of the Post-Office Telegraphs in Great Britain, in his report to the Postmaster-General, dated May 31, 1872, says, that the actual total number of messages transmitted during the year ending March 31st, 1872, was 12,473,797.

Therefore the entire increase in the number of messages sent in England during a period of six years, two of which the lines have been operated by the Post-Office, has been only one hundred per cent. In 1868 the Western Union Telegraph Company

Digitized by Google

sent, exclusive of Press reports, 5,733,394 messages, and in 1872, 10,932,138, being an increase in five years of about 92 per cent.

This, it will be observed, is the increase of one company only, and if we were to add the business of the Atlantic and Pacific, the Pacific and Atlantic, the Franklin, the Great Western, and the numerous other companies who are competing with the Western Union for the telegraph traffic of the country, the total increase would be found to considerably exceed that of the English governmental lines.

As to the financial condition of the British system it is difficult to arrive at any definite results. The latest report which we have been able to obtain, gives the gross receipts for the fourteen months ending March 31, 1871, at £798,580, and the total expenditures at £1,397,389. A part of this is properly chargable to capital account. Just how much it is difficult to determine. The expenditures in the report are divided as follows: Working expenses, £470,495; Capital expenditure, £926,894.

Under the head of Capital expenditure are £346,-794, for poles, arms, wire insulators, instruments, batteries and tools, none of which items are to be found under the head of working expenses. And yet, how could a telegraph of the magnitude of the British system be worked fourteen months without requiring heavy necessary outlay for these articles, irrespective of construction ?

Under the head of Capital account, £377,449 are also placed, for engineering, salaries and travelling expenses, alteration of buildings, preliminary instruction, bonuses to learners, office fittings, examining accounts of telegraphic companies, law expenses, &c., none of which items appear under the head of working expenses, although just such expenses must continue to be made every year as long as the telegraph is maintained.

If a large annual expenditure is required, however, for extending the telegraphic facilities to meet the wants of the service, it makes little difference, in reality, whether such expenditure be classified under the head of working expenses or capital account.

The assertion in Mr. Ramsey's report, that the rates were reduced in Switzerland in 1866, one-half, and that the number of messages doubled the next year, is only true as to inland messages ; no reduction having been made in the rates for international and transit messages, upon which double tolls are charged for less than half the service.

The official Swiss report gives the total number of messages in 1867 at 708,020, and in 1868, at 1,153,-092, showing an increase of 63 per cent. only. It is also worthy of notice, that there was an increase of 15 per cent. in international and 10 per cent. in transit messages, notwithstanding there was no reduction in the rates in either of the latter classes of messages. The incorrectness of Mr. Ramsey's assertion is shown by his own table ; unless it is admitted, that the expense of conducting the business is from two to three times as much as the rates charged. For example, it is stated, on page 11, that the telegrams in Switzerland in 1867, at the rate of one franc, amounted to 397,289, and the expenses, $130,817, which would make the expense per telegram 33 cents ; and in 1868, 789,186 telegrams at the rate of half a franc, the expenses amounting to $169,496, which would make an average expense of 21 cents per message, or twice the alleged rate.

In stating the amount expended in Switzerland in 1868, Mr. Ramsey entirely omits to mention the sum of 136,116 francs and 15 centimes, expended for construction. Perhaps this omission was not intentional, and may be owing to the fact that the Swiss report omits it from its customary place, an admission of which is made in page 23 of the official report for 1868, as follows :

"Under the head of construction and repairs of "lines, there is a decrease of 64,914 francs from the "amount expended in 1867, and of 23,873 francs and "36 centimes from the amount estimated in the bud-"get. We should observe, however, that in the sum "of 105,126 francs and 64 centimes expended under "this head are not included the expenditures of new "construction. These expenditures, amounting to "the sum of 136,116 francs and fifteen centimes, "were defrayed out of the credit of 500,000 francs "allowed to the administration in accordance with "the federal decree of 17 July, 1867, and only the "interest on the amount received in advance appears "in the above item."

Three kinds of messages are charged for in the European telegraph system, called respectively, Internal, International and Transit. The Internal messages are sent, received and delivered in the same country ; the International messages are sent from one country into another. The Transit messages are neither sent nor received to or from the country in which they are reckoned, but are merely shot through such country on their way from one neighbouring State to another. Previous to 1868 the Swiss Telegraph Administration charged a uniform rate of one franc for a message of 20 words, including address and signature, upon all classes of messages. On the 1st of January, 1868, the rates for Internal messages were reduced to half a franc, while those of International and Transit messages were kept at the old rate of a franc. The result of this operation was as follows: 798,186 Internal messages were transmitted for $87,800.46 and 282.627 International and 72,279 Transit messages were sent for $83,048, making the total receipts $180,848.46. The expenditures for the year being, as above stated, $211,821.29.

Now, while it is true, that the average tolls collected upon the Internal messages were but eleven cents, and that the number of said messages sent during the year was doubled, it must not be forgotten, that the average tolls upon the International and transit messages was 23 cents, and that it was the extra charge upon this class of business which prevented a still greater deficiency upon the whole business for the year.

As so much importance has been attached to the pretended great success of the Swiss system, we deem it worth while to present all the facts relating to the operation of the telegraph in Switzerland from its commencement in 1852 to the close of 1871. These facts are taken from the official reports.

The total expenditures for telegraph service in Switzerland from 1852 to 1871, inclusive, were..... $2,425,896 65
The receipts for Telegrams..... 2,268,202 32

Loss..... $ 157,694 33

During the past twenty years 7,779,603 Internal telegrams were transmitted, the receipts for which amounted to $1,217,625 88 or 15 6-10 cents each ; and 2,895,245 International, and 860,879 Transit messages, the receipts for which were $1,050,576 44, or 28 cents each.

During the above mentioned period, $37,0078 49 were received by the Swiss Telegraph administration, which the official reports state were mainly composed of contributions from the Communes.

An examination of the statistics of the Swiss telegraphs shows that the increase in the number of messages sent is accompanied by an approximately proportional increase in the expenses. Comparisons show that, when the business was small and the wires but partially occupied, a considerable increase in the number of messages was effected without material additions to the lines ; the first outlay having been more than sufficient for the traffic ; but as soon as the traffic increased sufficiently to fully occupy the wires, additional construction became necessary. In 1861, an increase over 1856 of 46 per cent. in the number of messages, was accompanied by an increase in line of 24 per cent., wire 34 per cent., offices 50 per cent., receipts 40 per cent., and of salaries 54 per cent. In 1866, an increase over 1861 of 102 per cent. in the number of messages was accompanied by an increase of 56 per cent. in wire, 81 per cent. in offices, 74 per cent. in salaries, 53 per cent. in the expenditures for lines, and 50 per cent. in other expenses. In 1868, an increase over 1866 of 72 per cent. in messages was accompanied by an increase in the number of miles of line of 20 per cent., number of miles of wire of 56 per cent., in offices of 38 per cent., in salaries of 39 per cent., and in other expenses of 44 per cent. The total receipts were increased by 24 per cent., while the total expenses were increased 54 per cent.

During the year 1867, in anticipation of the large increase of business by the reduction of the tolls, great additions were made to the lines and wires. At the beginning of 1867 there were 4,098 miles of wire in operation in Switzerland, and on the 1st of January, 1869, there were 6,438, being an increase of 57 per cent., while the total increase in the number of messages transmitted was but 63 per cent.; and yet it is officially stated in the report of the working of the Swiss lines, that there was a time during the Summer of 1868 when the number of messages was found to exceed the means of transmission.

The experience in Switzerland is not exceptional, but is substantially the same in all other countries. In 1865, Belgium had 5,400 miles of wire, and transmitted 674,027 messages. In 1868, 8,730 miles of wire, an increase of 61 per cent., and transmitted

Digitized by Google

1,053,230 messages, an increase of 56 per cent. In 1866, France had 68,687 miles of wire, and transmitted 2,507,472 messages. In 1868, 89,086 miles of wire, an increase of 29 per cent., and transmitted 3,209,965 messages, being an increase of 28 per cent. In 1865, Italy had 22,800 miles of wire, and transmitted 1,490,175 messages. In 1870, 30,906 miles of wire, and transmitted 1,813,320 messages, showing an increase of 35 per cent. in wire, and 21 per cent. in messages. In 1865, Norway had 2,666 miles of wire, and transmitted 197,312 messages. In 1870, 5,606 miles of wire, an increase of 110 per cent., and transmitted 364,009 messages, an increase of 84 per cent. In 1865, Holland had 3,408 miles of wire, and transmitted 558,501 messages. In 1870, 6,297 miles of wire, an increase of 84 per cent., and transmitted 1,356,812 messages, an increase of 142 per cent. In 1865, Sweden had 6,578 miles of wire, and transmitted 287,929 messages. In 1870, 10,089 miles of wire, an increase of 53 per cent., and transmitted 494,111 messages, an increase of 71 per cent.

In 1866, England had 80,466 miles of wire, and sent 6,127,000 messages. In 1870, 130,000 miles of wire—an increase of 61 per cent., and transmitted 10,932,138 messages—an increase of 92 per cent.

In 1868, the Western Union Telegraph Company had 97,594 miles of wire, and transmitted 6,373,095 messages. In 1872, 137,190 miles of wire, an increase of 40 per cent., and transmitted 10,932,138 messages, an increase of 69 per cent.

The exceptionally favorable results in the operation of the Western Union lines is attributable principally to two causes, the first of which is the great improvement in the condition of the wires, $3,875,210 having been expended since 1868 in reconstructing and repairing them. The second cause for the greater proportional increase in the nnmber of messages transmitted, is to be found in the inauguration, in 1869, of the transmission of messages at night at half rates, by which the wires to a considerable extent have been utilized during the night, when they were formerly but little used. This system of transmitting messages during the night at one-half the day rates is peculiar to this country, and is not in operation in any other country in the world. Among the chief causes which led to the inauguration of the half-rate system, was the constant demands which were made on all sides for additional wires to meet the increasing traffic of the Company, while at the same time those already in use were comparatively idle for the greater portion of the night and the earlier hours of the day. It was apparent that the half-rate plan, if it should meet with success, must necessarily result in either one of two things: the creation and development of an entirely new traffic, or the taking away of a portion of the full-rate business, which was transacted during the day. If it created a new business, which the full rates failed to reach, it would be performing a good service; while, on the other hand, if it secured a portion of the full-rate messages, it would relieve the wires during the busy hours of the day, and make room for the transmission of new full-rate despatches, and thus prevent or postpone the necessity of putting up additional wires for an increased service.

The immediate effect upon the revenue of a reduction in the rates is well illustrated by the experience of the Western Union Company.

On the first of October, 1869, a new air line tariff was adopted, which greatly reduced the rates. During the first month after the reduction took place, there was a decrease in the gross receipts as compared with the same month of the preceding year of $41,385.07, accompanied by an increase in the current expenses of $26,929.26, making a difference in the net profits of $68,314.33. The second month after the reduction in the rates showed, as compared with the same month of the preceding year, a decrease of $7,241.28, accompanied by an increase in the current expenses of $19,001.24, making a reduction in the net profits of $26,242.52. The gross receipts for the third month after the reduction as compared with the previous year, showed a falling off of $37,566.56, accompanied by an increase in the current expenses of $27,239.29, making a decrease of $64,805.80 in the net profits.

On the first of January, 1870, the new half rate tariff for night messages went into operation. The gross receipts for this month were $62,113.21 less, and the expenses $58,452.38 more than for the corresponding month of the previous year, making a decline in the net profits of $120,565.59.

The gross receipts of the fifth month after the reduction were $53,832.48 less; the current expenses $25,924.48 more, and the net earnings $79,756.96 less than for the corresponding month of the previous year.

The gross receipts of the sixth month after the reduction, was $6,686.86 less; the current expenses $11,829.95 more, and the net earnings $18,516.79 less, than for the corresponding month of the preceding year.

The gross receipts of the seventh month after the reduction, were $24,448.54 less; the expenses $16,642.58 more, and the net earnings $41,091.12 less than for the corresponding month of the preceding year.

Thus from October 1st, 1869, when the reduced tariff went into operation, to May 1st, 1870, the gross receipts were $233.273 less, and the expenditures $186.019 more than for the same months of the preceding year, making a reduction in the net earnings of $419,293.

The net earnings of the Western Union Telegraph Company for the year ending June 30th, 1869, were $2,748,801.45. For 1870, $2,227,965.54. For 1871, $2,532,661.66; and for 1872, $2,790,232.61. It thus appears that it took three years for the net revenues of the Company to recover from the reduction in the rates inaugurated in 1869, during which time the Company erected 32,606 miles of wire, opened 1,630 new offices, and increased its annual transmission of messages over 50 per cent. The erection of this large amount of wire, rendered necessary to perform the increased traffic, is not included in the expenses, but was paid for out of the net profits of the Company and the Company has not made any dividend whatever during the past three years.

The following table will serve to illustrate to some extent the great reduction made by the Western Union Telegraph Company during the past five years:

TARIFF FROM WASHINGTON, D C.

The average reduction for the transmission of day messages to the above offices, with whom Washington transacts 84 per cent. of its business, is 44 per cent., and the average reduction for the transmission of night messages is 73 per cent. On the 1st of Feb-

* The rates in this column are for full paid day messages. Messages are received for transmission during the night at one-half these rates.

Digitized by Google

ruary, 1873, all rates, which previously exceeded $2.50, were reduced to that amount.

Upwards of 50 per cent. of the business of the Washington office is transacted with Baltimore, Boston, Cincinnati, Chicago, Louisville, New York, Philadelphia and Pittsburgh, where the average reduction in the rates is over 53 per cent. for the transmission of day messages and 84 per cent. for the transmission of night messages.

Although the receipts of the Post-office Telegraphs in England have not as yet equaled the expenditure, there is no reason why they should not be ultimately self-sustaining, but this does not tend to prove that the union of the Telegraph and Postal Systems in the country would be a wise or profitable measure.

The British Post-office has long enjoyed an enviable reputation. It promptly and satisfactorily carries and delivers letters, at one penny each, through the United Kingdom, and makes a net profit of over five million dollars per annum; while our Post-office charges three cents for carrying a letter, without delivery, except in the larger cities, and manages the business at an annual loss of over five million dollars.

During the past five years the deficiency in the United States Post-office has amounted to $25,114,054, while, during the same period, the net revenue of the British Post-office has amounted to $34,190,717 in gold.

Mr. Ramsey states, in his report, that the total stock and cash dividends of the Western Union Company, since its organization in 1858, is $47,478,736, but he fails to make the still more important statement, that the total cash dividends of the Company, during this term, have only been $8,751,503, the remainder having been expended by the Company in providing additional facilities required by the increased traffic arising from the enormous reduction in the rates, and improving the financial condition of the Company, in anticipation of future remuneration.

The claim that the Western Union Telegraph Company is now, or may hereafter become, a dangerous monopoly, is entitled to no consideration whatever, since, in the first place, the telegraph business is everywhere in this country open to free competition, no one company having any advantage over another, except what it legitimately acquires by the greater skill with which it performs the service; and in the second place, the Act of 1866, which constitutes a compact between the Government and the Western Union Telegraph Company, provides that the United States may at any time after the expiration of five years from the date of the passage of the act, purchase all the telegraph lines, property and effects of the Company at an appraised value, to be ascertained by five competent disinterested persons, two of whom shall be appointed by the Postmaster-General of the United States, two by the Company, and one by the four so previously selected.

The success of the Hubbard scheme would inevitably depreciate the value of the property of this Company, which the Government can at any time take at an appraisal, not of its cost, but of its value. Congress cannot consistently and in good faith confer such a franchise upon Mr. Hubbard without first releasing this company from the obligations of the above act, and providing a just measure of compensation for the depreciation of its property which would result from the granting of such extraordinary privileges to a competitor.

Mr. F. W. Jones has been appointed Sunday manager of the W. U. Chicago office.

EARLY EXPERIMENTS OF MORSE.

A friend of the Journal writing at Boyd, Ky., communicates an interesting extract from an ancient periodical, regarding the early experiments of Prof. Morse in perfecting the electro-magnetic telegraph. He says:

In looking over an old "Peoples' Magazine," printed in Cincinnati in 1838, I found the following notice taken from the "Morristown Jerseyman," which may prove interesting to operators, and teach them not to despise the day of small things. Think of it, ye modern Gods, who work from the Atlantic to the Pacific, of transmitting a spark a "distance of two miles instantaneously":

"Prof. Morse's Electro-Magnetick Telegraph.—It is with some degree of pride that it falls to our lot first to announce the complete success of this wonderful piece of mechanism, and no place could have been found more suitable to pursue the course of experiments necessary to perfecting the detail of machinery than the Speedwell Works. Replete, as they are, with every convenience, Professor Morse quietly pursued the great object, and has finally succeeded. Others may have suggested the possibility of conveying intelligence by electricity, but this is the first instance of its actual transmission and permanent record. The telegraph consists of four parts. 1st. The *battery*. A Cruikshank galvanick trough of sixty pair of plates, seven by eight and a half inches each. 2d. The *portrule*. An instrument which regulates the motion of the rule. The rule answers to the *stick* of the printers, and in it the type representing the numbers to be transmitted are passed beneath the lever which closes and breaks the circuit. 3d. The *register*. An instrument which receives and records the numbers sent by the portrule from any distant station. 4th. A *dictionary*. Containing a complete vocabulary of all the words in the English language regularly numbered. The communication which we saw made through a distance of two miles was the following sentence: '*Railroad cars just arrived; 345 passengers.*' These words were put into numbers from the dictionary; the numbers were set up in the telegraphick type in about the same time ordinarily occupied in setting up the same in a printing office,

"They were then all passed complete by the portrule in about half a minute, each stroke of the lever of the portrule at one extremity working on the register at the other, a distance of two miles, instantaneously. We watched the spark at one end and the work of the pencil at the other, and they were as simultaneous as if the lever itself had struck the mark. The marks or numbers are easily legible, and by means of the dictionary were resolved again into words.

"The superiority of this telegraph over all hitherto invented is, that day or night, in clear or in foggy weather, intelligence can be sent instantaneously.

"The advantages to the government and the country of such a means of communication are incalculable."

UNDERGROUND TELEGRAPH WIRES.

A recent heavy rain, followed by a severe frost in this city, played great havoc with the telegraph wires. The weight of ice was so great as to cause innumerable breaks, so that the elaborate fire alarm system became useless, and for a time it appeared as if communication with other cities was to be seriously interrupted. This has caused a re-agitation of the subject of underground wires, which, it is justly believed, would prove of great advantage as compared with those now in use. Not only would the unsightly telegraph poles be removed from our streets, but such casualties as the above, due to the weather, would be permanently averted.

Professor Silliman, in a recent letter, points out some of the difficulties incident to the underground plan. He says that gutta-percha covering will not answer for insulation where it is exposed to the action of moist earth and vegetable processes. An element also, that is to be carefully considered in carrying out a general system for underground telegraphs in cities, is the facility that must be given for relaying in case of accident or of excavations in the streets for constructive purposes. If, however, says the Professor, the wire is once properly laid underground, in insulatory material, proof against natural agencies of destruction, the "electrical leakage" is very small, so much smaller than is possible with wires in the air as to be a great saving to the telegraph company. —*Scientific American.*

CUTTING WOOD BY ELECTRIC HEAT.

The following item is going round the press:

"A curious invention has just been patented for cutting wood without a saw. A galvanic current, in sufficient quantity, when passed over fine platinum-wire, raises its temperature to a white heat. The inventor discovered that wood, a comparatively dry substance, even when green, could be cut in the same way. By arranging the wire with handles, or other means, so as to guide it readily, trees, logs or planks may be cut as desired. There is here, therefore, a simple and easily applied force, which may be employed to fell trees, divide them into logs, and perform all the operations of the saw and ax. The surface is slightly charred, but the black layer is very thin. The battery employed need only be of the simplest character."

We remark to this, that the heat produced by a voltaic battery has several years ago been used for heating a platinum-wire, and applying this in place of a knife in surgery. The inventor probably saw a surgeon use such a wire to amputate a tumor, and then the idea flashed upon his mind to patent the cutting of trees in this way, without stopping to think of the great expense of a sufficient battery, which is of no consequence where surgical operations are to be performed, and the saving of human life is involved, but is of great importance in cutting lumber. The statement that "the battery employed needs only to be of the simplest character" is an illusion; it may be simple, but it must consume considerable zinc and acid. If the electric current, and the consequent heat, could be obtained in a cheaper way, this method might compete with the saw and ax, which are now and will long remain the cheapest means. Theoretically, however, the use of a steam saw is a roundabout method; by means of the combustion of coal heat is produced, by means of steam this heat is by more or less complex machinery changed into the motion of the saw, and this motion separates the wood fibre by mechanical force, while the application of a heated platinum wire makes the heat itself directly perform the work of separating the fibres.

Experience has proved that electric light and heat can be cheaper produced by the rotation of a magneto-electric machine, ran by a steam-engine, than by a battery, and for this reason some light-houses are illuminated in this way; this is, therefore, an economical improvement on the patent mentioned above; but it is evident that even this improvement can be no true economy. To cause a steam engine to run a magneto-electric machine to heat a wire, and cut with this, in place of letting the steam engine run simply a saw, must cost more.

There is still another way of producing an electric current direct by heat of combustion, namely, with a thermo-electric battery, which does not involve the intervention of a moving engine. Improvements in this direction are confidently expected by all who have watched the tendency of the progress in electric science. Some time ago some kind of thermo-electric stoves were used for electroplating, but they recently have been rejected to make place for the latest improved magneto-electric machines, driven by steam power.—*Manufacturer and Builder.*

The Boston *Globe* says: "And now there is an epidemic of railroad accidents in all directions, postal telegraphy is the next great step to be achieved by Congress.

The *Globe* doesn't explain what connection exists between epidemic accidents and postal telegraphy, but doubtless they are to be regarded as public misfortunes of about the same gravity.

L. G. TILLOTSON & CO.,

Sole Agents for the Leclanche Battery Co.

Address of

LECLANCHE BATTERY COMPANY,

No. 40 West Eighteenth Street.

F. L. POPE & CO.

Manufacturers and Dealers in

Telegraph Instruments and Supplies

OF EVERY DESCRIPTION,

194 Fulton Street, New York.

New and Superior patterns of

STANDARD TELEGRAPH INSTRUMENTS,

Their RELAYS, SOUNDERS, and KEYS which have been specially designed by Mr. F. L. Pope, are elegantly designed, thoroughly well finished and scientifically adapted to the service required and are recommended as SUPERIOR TO ANY HITHERTO OFFERED.

In addition to ALL DESCRIPTION OF TELEGRAPH MATERIALS AND THESE SUPPLIES are furnished, such as

INSULATORS, BATTERIES,
INSULATED WIRES,
CHEMICALS., ETC, ETC.

MAGNETIC AND DIAL INSTRUMENTS.

We have for sale also THE NONPAREIL TELEGRAPH INSTRUMENT for amateurs, learners and short lines.

A COMBINATION SET, comprising Sounder and Key on a handsome rosewood base.

Bradley's Box Relays and Sounders,
Bradley's Apparatus for Electrical Measurement.
Bradley's Naked Wire Relices and Magnet Spools to order, any desired size and resistance, at manufacturers' lowest price.

Descriptive Circular and Price Lists forwarded upon application to

F. L. POPE & CO.,
P. O. Box 6010 ***194 Fulton St., N. Y.***

WANTED,

GOOD LINEMEN,

IMMEDIATELY.

Address W. H. SAWYER, Gen'l Sup't.,
Am. Dist. Telegraph Co.,
Room 12. 62 Broadway, N. Y

TELEGRAPHERS' EMPLOYMENT BUREAU,

TOLEDO, OHIO.

—o—

A Telegraphers' Employment Bureau has been established in this city, under the direction of several well known Telegraph Superintendents, having for its object the reception of applications for positions as operators, or operators and clerks or agents combined.

Applicants must state:

1st—Age. How long in the service. Reason for changing position. Present Salary. Sound or paper reader. Able bodied or otherwise.

2d—Applicants must send recommendations from present employer, or if not at work, from former employer as to moral character and capabilities. Recommendations to state if applicant is capable of filling positions other than operator, such as ticket agent, freight clerk, or agent.

This list will be published monthly and forwarded to the Superintendents of Telegraph Lines and a copy sent to each applicant whose name is printed thereon. All names to be published two (2) months. All applications to be accompanied by a fee of two (2) dollars.

Address,

Telegraphers' Employment Bureau

TOLEDO, O.

THE

ELECTRIC RAILROAD SIGNAL CO.

SPECIAL NOTICE.

OFFICERS OF RAILROAD COMPANIES, and others interested, are notified that this Company is the sole owner of the ORIGINAL PATENT for operating

ELECTRIC SIGNALS

by including a section of a railroad track in the electric circuit, which was issued to F. L. POPE, July 16, 1872. Railroad Companies are **CAUTIONED** against negotiating with unauthorized parties for the use of this Invention, as this Company will take legal measures to protect themselves against all **INFRINGEMENTS.**

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 7. NEW YORK, MARCH 1, 1873. WHOLE NO. 128.

ON A MODIFIED FORM OF "WHEATSTONE'S BRIDGE," AND METHODS OF MEASURING SMALL RESISTANCES.

BY G. C. FOSTER, F. R. S.

The object of this paper is to describe simple methods for the following purposes connected with the measurement of electrical resistances, namely :—

I. The measurement of small resistances, by ascertaining what length of a graduated standard wire has an equal resistance.

II. The electrical 'calibration' of wires, or the division of them into lengths of equal resistance.

III. The elimination of errors due to the resistance of connections from determinations of specific resistance.

It will be seen from what follows, that the arrangement of apparatus employed for these purposes might be varied in many ways, but it will probably conduce to clearness if I confine my description to the arrangement that I have actually used. In all the experiments, the principal piece of apparatus, besides a battery and a galvanometer, was a Differential Resistance Measurer,—or, as it is commonly called, a "Wheatstone's Bridge,"—of the form usually made by Messrs. Elliott Bros., for purposes of demonstration and research ; and, as I shall have to make frequent reference to this instrument, it may be well to give a brief description of it before speaking of the special purposes to which it has been applied.

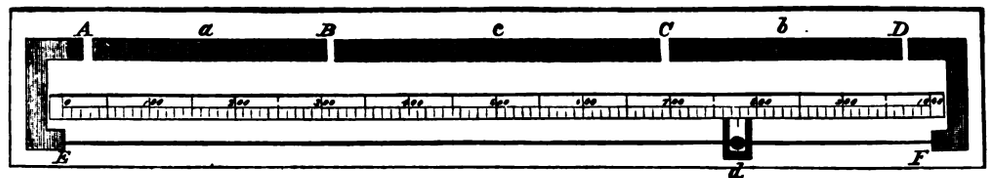

Fig. 1.

Fig. 1 shews the arrangement of its essential parts on a scale of about ½. A piece of german-silver wire, E F, from 1.5 mm. to 2 mm. in diameter and 1 metre long, is stretched upon an oblong board forming the base of the instrument, parallel to a metre-scale divided throughout its whole length into millimetres, and is so placed that its two ends are approximately opposite to the divisions 0 and 1,000 respectively of the scale. The ends of the wire are soldered to a broad copper band, which passes round each end of the graduated scale and runs parallel to it on the opposite side from the wire. This band is interrupted by four gaps, A B C and D, at each side of each of which is a binding screw for connecting the conductors, whose resistance is to be measured. In the ordinary use of the apparatus, the wires from the battery are attached to the screws *a* and *b*, fixed upon the copper strips, A B and C D respectively, and the galvanometer wires are connected, one to the screw *c* on the strip, B C, and the other to the screw *d* upon a moveable block, which slides along the graduated scale and allows contact to be made at any part of the german-silver wire, while an index-mark shows the distance of the point of contact from each end of the scale. The conductors to be compared are inserted at the two middle gaps, B and C, and if they are of small resistance, the end gaps, A and D are usually closed by thick copper latches, or, if the resistances at B and C are considerable, conductors, whose resistances are known in terms of that of the wire, E F, are inserted at A and B ; it is easy to see that the effect of these, which may be regarded as ungraduated prolongations of the german-silver wire, is to increase the delicacy but to limit the range of the instrument. When the moveable contact *d* has been so placed that, on completing the battery-circuit, the galvanometer shows no deflection, it follows from the general principle on which the measurement is founded that—

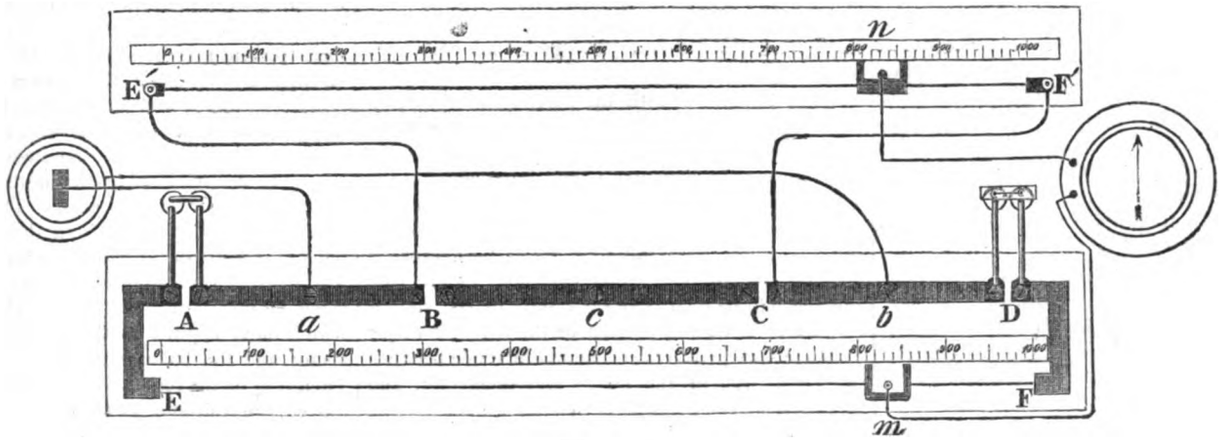

Fig. 2.

resistance *a* to *c* : resistance *c* to *b* = resistance *a* to *d* : resistance *d* to *b*. In most cases we may substitute for this, as a fair approximation,—

resistance at B : resistance at C = resistance E to *d* + resistance at A : resistance *d* to F + resistance at D, or

$$\text{—scale reading} + \left\{\begin{matrix}\text{length of wire equal}\\ \text{in resistance to A}\end{matrix}\right\} : 1{,}000$$

$$\text{—scale reading} + \left\{\begin{matrix}\text{length of wire equal}\\ \text{in resistance to D}\end{matrix}\right\};$$

but in adopting this last value as representing the ratio of the resistances at B and C, we are exposed to sources of error which need not be pointed out to any one accustomed to electrical measurements, and which become of greater importance in proportion as the resistances to be compared are smaller. These errors are almost entirely avoided in the process now to be described.

The resistance of any wire, whose resistance is less than that of the whole length of graduated german-silver wire, E F, may be found in terms of the latter as follows:—Insert the wire to be measured at the gap A, close the gap D by a conductor of insensible resistance, and insert at B and C any two convenient conductors, the ratio of whose resistances (which it is not necessary to know) does not differ from unity more than does that of the resistance to be measured and the resistance of the whole wire E F; then shift the moveable contact *d* until the galvanometer ceases to be deflected, and take the reading of the scale. Next put the wire to be measured at D and close the gap A by a conductor without sensible resistance; shift *d* until the galvanometer is again balanced, and take a second reading of the scale : *the difference of the two scale-readings gives the length of the wire* E F, *whose resistance is equal to that of the wire to be measured.*

This result is almost self-evident, but it may be proved, if needful, thus :—Let L denote the total resistance of the wire E F, A and D, the resistances inserted at the two end gaps, *e* and *f*, the resistances of the copper bands between *a* and E, and between *b* and F respectively, and let B and C stand for the total resistances between *a* and *c*, and between *c* and *b* respectively ; also let *m* be the scale-reading when the resistances A and D are in their first positions, and *m'* the reading when they have been interchanged ; lastly, let *k* be the resistance of unit length (1 millim.) of the wire E F. Then the two experiments give—

$$\frac{B}{C} = \frac{A + e + mk}{L - mk + D + f}$$

and

$$\frac{B}{C} = \frac{D + e + m'k}{L - m'k + A + f}$$

whence, by equating the two values of $\frac{B}{C}$ and adding unity to each side of the equation, we get :—

Digitized by Google

$$\frac{A + D + L + e + f}{L - mk + D + f} = \frac{A + D + L + e + f}{L - m'k + A + f},$$

or

$$A - D = (m' - m)k$$

In the measurement described above, we assumed the condition $D = 0$; if m_0 and m'_0 be the scale-readings corresponding to this condition, we have—

$$A = (m'_0 - m_0)\,k.$$

But, since in practice the resistance D can never be reduced absolutely to nothing, it is important, when great accuracy is required, that its value should be known: a method is given further on by which any resistance great enough to affect sensibly the reading of the instrument can be measured.

In order that measurements made in the manner that has been described may have a definite meaning, it is of course necessary that the value of the coefficient k, or the resistance of unit length of the wire E F should be known with reference to some recognized standard; and when, as in the instrument I have chiefly used, the resistance of the whole wire E F is a comparatively small fraction (about $\frac{1}{2}$) of a unit, some special method is needed for measuring k.

I have employed two methods for this purpose, the one which is, on the whole, the most convenient being the following: A wire, whose resistance, R, is only a little less than that of the whole wire, E F, is measured in terms of the latter by the process given above: let p be the number of millimetres between the two readings of the positions of the sliding contact, then

$$k\,p = R \ldots\ldots (1)$$

Next, a standard (unit) coil of resistance, S, is combined in multiple arc with the wire already measured, and the measurement is repeated; this gives, if q be the number of millimetres between the two readings in this case:

$$k\,q = \frac{R\,S}{R+S} \ldots\ldots (2)$$

Whence we get, as the value of the coefficient required,

$$k = S\frac{p-q}{p\,q}.$$

Another method is to insert a standard coil at one of the gap ends (say at A), and at the other (D) a wire whose resistance, R, falls short of that of the standard by not quite the whole resistance of E F, and to shift the moveable contact until the galvanometer is balanced; then to interchange the standard and the resistance, R, and shift the contact again till the balance is restored: let d be the difference (in millimetres) between the two readings of the scale in this experiment. Next, take a second wire whose resistance, R_2, falls short of that of R_1 by nearly the whole resistance of E F, and proceed with this and the first wire in the same way as with the first wire and the standard, and let d_1 be the difference between the two readings of the scale in this case. Proceed in this manner with wires of smaller and smaller resistance until one is arrived at of smaller resistance than the wire E F. Let the resistance of this wire be R_n: by inserting it at one of the end gaps and an insensible resistance at the other, and afterwards interchanging, we find, by taking the difference, d_n, of the scale-readings in the two positions required to balance the galvanometer, the number of millimetres of the graduated wire whose resistance is equal to R_n. By a set of such experiments we obtain:

$$\begin{aligned} d\,k &= S - R_1, \\ d_1 k &= R_1 - R_2, \\ &\vdots \quad\quad \vdots \\ d_{n-1} k &= R_{n-1} - R_n, \\ d_n\,k &= R_n; \end{aligned}$$

or

$$k = S\frac{1}{d + d_1 + \ldots + d_{n-1} + d_n}.$$

It has been tacitly assumed in the foregoing that the coefficient k, or the resistance of 1mm. of the graduated wire E F, is constant from end to end. This, of course, is never strictly the case, and hence it is desirable to measure not only the mean value of this coefficient for the whole wire, but also its value for the different parts, or else to assure ourselves that the variations of value are too small to be of importance. This examination of the wire is very readily made by the arrangement represented in Fig. 2, which shews a second graduated wire E′ F′ connected with a "Bridge" of the form already described. So far as the same reference-letters occur in this figure and in Fig. 1, they mark identical parts: the battery is connected (through a make-and-break key not shewn in the diagram) with the binding-screws a and b, and the terminals of the galvanometer are connected with *two* moveable contact-makers, one of them m on the principal wire E F, and the other n on the wire E′ F′—for convenience of reference this will be afterwards called the "compensating wire" or "compensator"—the ends of which are connected with the outer binding-screws of the gaps B and C. The end gaps A and B are closed, the one by a short and very thick piece of copper wire of almost insensible resistance, and the other by a short piece of german-silver wire of resistance equal to that of whatever length of the graduated wire it is desired to test at once. This piece of wire serves the purpose of a gauge with which each part of the wire E F is compared in succession: in most of my experiments its resistance was equal to that of about 70 mm. of the wire to be tested. The gauge being (say) at the right-hand gap D (as in the diagram) the sliding contact m is placed at or very near to the right-hand end of E F, and the slider n is moved on the compensating wire so as to destroy the deflection of the galvanometer. The gauge and the thick copper connector are next interchanged, and the balance is restored by moving the slider m: as already pointed out the length of E F over which the slider is moved, is that of which the resistance is equal to the difference between the resistances of the gauge and the thick connector. The gauge and connector are now put back into their first positions, and the slider n is shifted until the galvanometer is again balanced; then they are interchanged once more and the balance obtained by shifting the slider upon E F. This process of successively interchanging the gauge and connector, and adjusting the galvanometer to zero, by moving alternately the sliders m and n, is continued until the former has been brought step by step to the further extremity of the wire E F. It will be seen that each shift of the sliding contact m is over a portion of the wire E F whose resistance is equal to the constant difference between the resistances of the gauge and connector, and therefore that, by the process that has been described, the graduated wire is divided into parts of equal resistance, in a manner exactly comparable to that in which a thermometer-tube is "callibrated," or divided into portions of equal capacity, by marking on it the lengths successively occupied by a small quantity of mercury which is pushed along it.

The shift of the slider n also takes place over portions of the wire E′ F′ which have all an equal resistance, but this bears the same ratio to the resistance represented by the shifts of the slider m that the resistance of the branch a B E′ F′ C b bears to the resistance of the branch a A E F D b. To prove this, let the sliders be so placed that the galvanometer is in equilibrium when the gauge is at the gap D, and the gap A is closed by the thick connector: let the resistance of the gauge be denoted by G, that of the connector by C, the resistances of the wires E F and E′ F′ by L and L′ respectively, those of the permanent connections between a and E and between a and E′ by e and e', the permanent resistances between b and F and between b and F′ by f and f', and lastly the resistances of E m and E′ n by r and r'. We then have the equation—

$$\frac{C + e + r}{G + f + L - r} = \frac{e' + r'}{f' + L' - r'} \quad \ldots\ldots (1)$$

Then, by interchanging the gauge and connector, and balancing the galvanometer again by moving the slider n nearer to F′, while the slider m remains where it was, we get the equation—

$$\frac{G + e + r}{C + f + L - r} = \frac{e' + r'_1}{f' + L' - r'_1} \quad \ldots\ldots (2)$$

where r'_1 is the resistance between E′ and the new position of n, and therefore $r'_1 - r'$ is the resistance of that portion of the compensating wire over which the slider has been moved. By adding unity to each side of each of the equations (1) and (2), inverting the two new expressions thus obtained, and subtracting one from the other, we get—

$$\frac{r' - r'}{e' + f' + L'} = \frac{G - C}{G + C + e + f + L}$$

or

$$r_1' - r' = (G - C)\,\frac{e' + f' + L'}{G + C + e + f + L}; \quad \ldots (3)$$

which shews that, with the same apparatus, at each shift of the moveable contact along the compensating wire, it passes over a constant resistance of the magnitude stated above.

The value of the multiplier of G — C in equation (3) is easily found experimentally; for, since the resistance passed over at each shift of the slider on the principal wire E F, is equal to the difference G — C, denoting this resistance by $r_1 - r$, we obtain—

$$\frac{e' + f' + L'}{G + C + e + f + L} = \frac{r'_1 - r'}{r_1 - r} = M.$$

By help of this value, which for shortness may be denoted by M, exceedingly small resistances, such as that of the short copper connector mentioned above, are readily measured when they are connected so as to form part of the principal circuit. For this purpose, it is sometimes needful (in order that every measurement may come within the range of the instrument), to transfer the battery-wires from the binding-screws a and b to E′ and F′; when that is done, the factor M must be determined in this state of the apparatus, since the resistances e' and f' now belong to the principal branch of the circuit, instead of to the compensator branch. The galvanometer wire is now disconnected from the slider m and applied to one end of the connector (or other conductor whose resistance is to be measured) and the balance is got by means of the slider n; the galvanometer wire is next applied to the other end of the connector, and the balance is again got by the slider. Then if Q be the resistance over which the slider is moved, the resistance of the connector is given by—

$$C = \frac{Q}{M}$$

As an example of the resistances which are easily measurable in this manner, it may be mentioned that in two experiments the resistance of a thick and short piece of copper wire was found to be equal to that of 0·6 millimetre of the german-silver wire E F, or to be about 0·00008 of a B. A.-unit.

When the graduated wire of the bridge has been divided as above described into sections of equal resistance, it is of course easy to make a table showing what fraction the resistance of any given part of it is of the total resistance. The manner of doing this is too obvious to need further description. For the

Digitized by Google

sake of comparison, a table was made by the above process for a bridge-wire which had become very irregular through rough usage, and a similar table was made for the same wire from the results obtained in comparing together by means of it, in the usual way, a set of coils of known resistances. The numbers obtained by the two processes were almost identical; but I consider, nevertheless, that the method of the compensating wire and gauge possesses some advantages, since it does not depend upon the accuracy with which a set of resistance-coils have been previously adjusted, and the numerical calculations required are so simple that there is little danger of arithmetical error.

A method for the purpose of avoiding errors due to the resistance of connections in determinations of specific resistance, has been described by Sir William Thomson (*Proc. Roc. Soc.*, [1861] vol. xi., p. 313), but probably a simpler and equally accurate process is to connect the wire to be used for the determination, in the place of the german-silver wire E F of a bridge of the form shewn in figure 1, and to proceed precisely in the manner already indicated, for the measurement of the resistance of the unit length of the bridge-wire. The result is in this case wholly independent of any resistance outside the extreme positions of the sliding contact-maker, and since this is only used for finding a point which gives *no current* through the galvanometer, the result is also unaffected by any moderate variation of resistance at the movable contact itself. I do not think there could be any great difficulty in arranging the apparatus so as to admit of the wire between E and F being immersed in a bath of liquid, so that its temperature might be known with greater accuracy than is possible when it is exposed to the air, but I have made no attempts in this direction.

It will be seen that the accuracy of the methods of measurement described in this paper, depends essentially on the possibility of connecting the conductors inserted at the two gaps A and D with the rest of the apparatus in such a way, that they can be taken out and put back again time after time, without causing any perceptible change in the resistance of the connections. In this respect, I have found the use of well-amalgamated copper rods, resting by their flat ends on an amalgamated plate of copper, forming the bottom of a mercury-cup of the form devised (I believe) by the late Dr. Matthiessen, and described by him and Mr. Hockin (*Rep. Brit. Assoc.*, 1864, p. 354), quite satisfactory.

OBSERVATIONS DURING THE RECENT ELECTRIC STORM.

The Chicago *Inter-Ocean* contains the following account of the electrical phenomenon which accompanied the great storm of January 7th and 8th, communicated by Mr. C. H. Summers, electrician of the Western Union Telegraph Company.

"The disturbances were first noticed on the wires in Central Iowa. The lines leading west were rendered useless for the transmission of messages, owing to an incessant discharge of electricity, increasing in intensity until it would leap from one strap of the switch board to another, across the intervening space, and then, in a luminous stream, the ground plate of the lightning arrester. Another singular fact observed was that, on some routes where a number of wires occupied the same poles, one wire alone was highly charged, or so affected that to work it was an impossibility, while all the others were entirely free from any external influence. In some cases the wire occupying the top of the pole would apparently receive the whole charge; in others, the bottom wire would be affected, and in a few cases the charge was equally distributed among all the wires. In the Chicago office the effect was similar to that observed in Iowa, and every observation confirmed the opinion that the centre line of the storm was due east from Des Moines, Iowa, to Detroit, Mich., narrowing in its limits north and south as it approached the latter place, where it arrived on the evening of the 8th ult., and rapidly subsided. A high wind, varying from twenty-five to twenty-eight miles per hour, accompanied the storm.

At the Eastern slope of the Rocky Mountains a similar phenemenon has been frequently witnessed upon a wire running north and south, but rarely on an east or west wire. Mr. Summers ascribes it to the fact that, under the theory that the earth is charged with electricity negative to the atmosphere, there must be a point where discharge occurs or nutralization takes place. At points where the relative humidity of the air is very great this is doubtless ever silently going on, but during seasons of intense cold, when the air is necessarily dry, the combination is evidently rendered more difficult and the tension thereby greatly augmented. If, under these circumstauces, good conductors, such as telegraph wires, are interposed, they would certainly assist in carrying a good part of the atmospheric charge to a point where the electric tension was far less. What the electrical condition of the telegraphic wires on the same pole was, to render one more susceptible than another to this inductive influence, or why wires running in other directions than east and west should not have been similarly affected, are problems yet unsolved. A recurrent storm, it is hoped, will afford an opportunity for more extended and acute observation."

MANUFACTURE OF SUBMARINE TELEGRAPH CABLES IN SAN FRANCISCO.

The manufacture of wire rope has been carried on for some time in this city, but until recently no attempts have been made to manufacture submarine telegraph cable, and in fact there has been little need for it here until the past few years. We paid a visit this week to Hallidie's Wire Rope and Submarine Telegraph Cable Works, on the corner of Vallejo and Sansome streets, San Francisco, to see a cable that was being made for the Electrical Construction and Maintenance Company. The premises occupy a fifty-yard lot near the water, and in a convenient place for shipping. The main building is two stories in height, the lower story of which is used for the machinery, and the upper for a loft or place for fitting ropes, etc. There are three wire rope-making machines of different sizes in the building, besides the one used for making the cable. While there we saw a three-inch wire rope 300 feet long, made in nine minutes. Of course the bobbins, etc., were previously prepared.

The cable is made on one of Bowden Bros' horizontal cable machines of twelve spindles, constructed at Newcastle-on-Tyne, England. A piece of cable two miles long has just been shipped, and the piece being made will, when finished, be 13,200 feet, or about two and half miles in length. The core consists of seven No. 22 copper wires thoroughly insulated up to 5-16 of an inch in diameter, covered with gutta-percha and Chatterton's compound; over this is a layer of canvass and rope yarn, measuring in all 9-16 of an inch; outside of this core are twelve No. 9 galvanized iron wires, each of which has a tensile strength of 1,500 pounds. When finished the cable is about one inch in diameter, and weighs in round numbers four-fifths of a pound to the foot. The gross weight of the cable and reel upon which it is wound, for the one length of two and a half miles, will be 13,000 pounds. The factory with its present machinery can turn out a mile of cable in a day of ten hours. They recently made 12,000 fathoms in a single night.

In making the cable, the core passes through the hollow shaft on the machine, and, meeting the wires at a central point, is covered by them. The twelve bobbins revolve around a common centre and the rope is drawn on to the reel by gearing attached to the reel. Considerable care is required to keep an exact strain on all the bobbins, for if one wire breaks, the machine has to be stopped in order to join the ends.

This enterprise is of course as yet only in its infancy, but the proprietor hopes to extend his business ultimately to greater proportions. In fact, the main cause of its foundation is that they are in hopes of being able to make the China and other cables for the Pacific. The great danger to be apprehended in the transportation of submarine cable is from the change of temperature in crossing the tropics, as shown by the experience of the Red Sea and Panama cables. The only safe way is to lay it in large tanks filled with water. The reason why the Atlantic cable was so successful was that it was put down in a favorable season with no extreme heat, and is, moreover, in a northern latitude. If a cable to run to China were built in the Eastern States and shipped here, it would have to be carried across the tropics twice, and it would be impracticable to put large lengths on cars and then reship it into vessels. Therefore, it will be much more economical, and at the same time more convenient, to have these cables made here, and this factory will be able to make them. In such a case, of course, appropriate machinery will be supplied for turning out large pieces.

The factory employs at present fourteen men. The engine and boiler are in a shed adjoining the main building. Large scales are placed in a convenient position for weighing the wire, etc., and there is a commodious yard with storehouses for surplus stock, etc. The wire ropes for mining purposes, etc., are not generally made of galvanized wire, but of common wire, which receives a coating of Stockholm tar. The tar in the tanks is heated by steam, to avoid the use of fire on the premises as much as possible. We saw at the factory the old hoisting rope of the Amador mine, which has been lying since the fire at the bottom of the shaft. It is now being repaired and straightened, a thing which seems almost impossible, as it was twisted and unwound in every direction, and was covered with rust. They have made at this factory wire ropes 4,000 feet long. The establishment is very complete, and may be ranked as one of the rising industries of the State.—*Mining and Scientific Press.*

New Electrical Discovery.—Dr. Blake, of the San Francisco Academy of Science, and Judge Hastings, of the California State Geological Survey, announce the discovery of a current of electricity running north and south at a distance of about 150 miles from the Pacific coast, along a belt of metallic deposits, which serves as a conducting chain between the poles.

The dip or inclination of the magnetic needle was discovered in 1576, by Robert Norman, an optician of London. He first constructed the dipping needle.

The Shah of Persia has just conferred upon Mr. Carl Siemens the Order of the Lion and Sun, in consideration of the services he has rendered to electrical science generally, and of his efficient maintenance of the telegraph lines in Persia in particular.

CORRESPONDENCE.

To the Editor of the Journal of the Telegraph.

CIRCLEVILLE, O., Feb. 12, 1873.

Will you please tell us by what rule twenty second (referring to date) is counted two words. I have been beaten in maintaining it in controversy at my office counter. If you can inform me the reason it is so counted, I shall be pleased.

The fact that we do so count it don't make it right. I would like to see this matter discussed a little. Our best scholars maintain it is one word. It looks to me very like a compound word, and to be so counted under Rule 9. The question is open for discussion. Is twenty second, when used to denote a date, one word or two ; if two, by what authority or rule ?

S. WARD, *Manager.*

Answer.—This is a very simple matter. The authority for calling "twenty second" two words, when used to denote a date, or for any other purpose, is, because it is two words. It is not a compound word; it bears the same relation to the days of a month as the date of a year does to an era. You would hardly count "eighteen hundred and seventy-three" as one word; yet, in its relation to the Christian era, it would be as correct to do so as to count twenty second in its relation to the days of a month.

CRAWFORD Co., Pa., Jan. 16, 1873.

To the Editor of the Journal of the Telegraph:

Can you give us, through the JOURNAL, any remedy for *poor* Daniell Porous-Cups. Three-fourths of all the cups we get are, indeed, poor ones ; so thick and hard, apparently, that a very weak current only gets through them ?

I have *one* that has been in use for years, and to-day that one cell produces *more* strength of current than all three others used in the office.

I know it is in the porous-cups, for this one works the same when changed to other jars.

Please tell us if there is not some solution or treatment to make every new porous-cup equal to a FEW that we get? Very truly,

H. C. B.

Answer—Soak the porous-cups in pure soft water.

MARLIN, Fall Co., Texas.

To the Editor of the Journal of the Telegraph:

Will you be kind enough to to give me the information herein required in regard to sending messages, viz. : I sent a message to New Orleans, tolls being $1.25 for full rate ; the party desired an answer, for which I collected $1.25 for an answer of ten words. The answer came with twenty-eight words, and the party refused to pay for the additional eighteen words. Who is to lose the tolls for the amount that should have been paid—$1.24?

Please reply in your next issue, and oblige

R. E. PARNELL, *Manager.*

Answer—The sender of the original message is responsible for the whole tolls of the answer. If you cannot collect the unpaid balance from him, make a statement to that effect, and return it with your monthly account. Of course, any party who should refuse to pay the balance of the tolls, under the circumstances presented by you, would decline to meet any other obligation, and, generally speaking, would be a person of such questionable appearance as would indicate a necessity for persons doing business with him, to exercise more than ordinary care, and it would be well, in such cases, to direct the messenger not to deliver the answer until the tolls were paid.

LEXINGTON, O., Feb. 18th, 1873.

To the Editor of The Journal of the Telegraph:

As you are constantly advising us to ask for information of what we do not exactly understand, and if informing me will not take up too much of your valuable time, I would like to be informed as to delivery of messages beyond the ordinary office limits, which is one-half mile per Rule No. 58. Part of Rule No. 10 reads, "managers may, &c;" and again part of Rule No. 58 reads, "In no case must a greater charge be made for such service than the amount disbursed." I have had several complain of being overcharged for such service. Now, if I receive a message for delivering and the amount received for transmitting the same does not exceed 55 cents, and the message is guaranteed ; what am I to do in this case? Surely I could find no person to deliver it for the above amount, as the conveyance might cost twice the amount received for transmitting the same. Does not part of Rules No. 10 and No. 58 conflict? BURKE.

Answer.—The rules do not conflict. The amount disbursed means the actual expense incurred in the delivery of a message; It has nothing to do with the tariff charges for transmitting over the wires.

VICTORIA, TEXAS, Jan'y 7th, 1873.

To the Editor of The Journal of the Telegraph:

According to Rule Twelve (12) "Transient persons sending messages which require answers must deposit in advance an amount sufficient to pay for a reply of ten words." Now, if it is not too much trouble, please inform me through the JOURNAL, how long should managers hold the amount so deposited? By so doing you will greatly oblige. A BEGINNER.

Answer.—Where parties have deposited money for an answer and none is received within a reasonable time, send a despatch to the office to which the orginal message was addressed, stating that the party who has deposited the money for an answer demands the amount returned, and that, unless the answer is received within a specified time, it will be returned, and that your office will not be responsible for the tolls upon the answer after such time.

URSA, Ill., Jan. 22, 1873.

To the Editor of the Journal of the Telegraph:

What is the price and from where would I order the "Standard Register," illustrated in No. 14, Vol. 5, of the JOURNAL? F. C. W.

Answer.—This instrument is manufactured by the Western Union Telegraph Company, for use in the Western Union offices, and can be ordered through the supply department ; it is not for sale.

To the Editor of the Journal of the Telegraph:

I am anxious to be informed, through the columns of the JOURNAL, upon the manner and principle a number of locals can be arranged so as to work independent of each other from one battery of two poles only. This, I believe, is now being the case in large telegraph offices, but I have not yet seen them at work. I have often heard of it, but have never found any one to readily explain it. By giving this your attention, you will oblige

TELEGRAPHIC INQUIRER.

Answer—Nothing is gained by working more than one wire from one local battery, but, on the contrary, there are many objections to the plan, and it never should be resorted to. The method of doing it, however, is to connect the zincs of several cups together for one pole, and the coppers of several cups together for the other pole, thus making a battery of large surface.

YORK, Pa., Feb. 7, 1873.

To the Editor of the Journal of the Telegraph:

For the benefit of all interested, please announce through the columns of the JOURNAL "What constitutes an answer to a message?"

GEO. W. SHOCH, *Manager.*

Answer—An answer is a reply, a rejoinder, or response.

To the Editor of the Journal of the Telegraph:

In JOURNAL of January 31, I see you render decision to "Dominick," that Rule No. 13, properly construed, means that one-half the "*usual*" rate charged for notification of the delivery of a message, is one-half the "*usual*" rate for ten words. Now, I hope I may be pardoned for differing with you as to the literal meaning of the Rule, whatever may have been its intended meaning, and my argument for this difference of opinion is this : if, as you say, it was intended that "one-half the '*usual*' rate" should be interpreted, one-half the rate for ten words, why was not ten words mentioned ?

In Rule No. 12 it says, "Transient persons sending messages which require answers must deposit in advance an amount sufficient to pay for a reply of ten words." Now in *this* Rule, ten words was meant and specified on the heading of blank No. 2, which is a contract between the public and our company, we are instructed, that "one-half the '*regular*' rate is charged, in addition, for repeating" back messages sent ; does this mean one-half the rate for ten words, or does it mean as is customary to be charged, one-half the rate for whatever number of words there may be in the message under immediate consideration, whether said message contains ten or one hundred words? What now, if you please, is the difference in the definitions of the words "*usual*" and "*regular*" when applied as quoted?

To state the case we will say, that the "*regular*" rate to Philadelphia for ten words is 30c., one-half for repeating back 15c., total 45c. The "*usual*" rate to Philadelphia for ten words is 30c., is it not ? one-half the usual rate for notification of delivery 15c., total 45c.; so far, then, "*regular*" and "*usual*" mean the same thing. The regular rate to Philadelphia for one hundred words is $2.10, one-half for repeating back, $1.05, total $3.15. What is the "*usual*" rate for one hundred words to Philadelphia ? is it any less than $2.10, and is half that "*usual*" rate 15c. Do not the words "usual" in Rule 13, and regular in the form of contract mean one and the same thing ? or does "*usual*" mean ten, and "*regular*" an unlimited number of words? As you say, it is of the utmost importance that the public should be made to clearly understand this matter, and in order that we who deal directly with the public, may express ourselves understandingly, will you please give us the course of reasoning by which you arrive at your definition of the word "*usual.*"

"ENQUIRER."

Answer.—There seems to be no difficulty in understanding Rule 13. It is the information which is furnished by the manager of the office to which the message is transmitted, for which half the usual rate is charged; and when such information is conveyed in ten words or less, only one-half of the usual rate for a ten-word message should be collected. If such information should contain more than ten words, then, of course, one-half of the usual rate upon such excess would also have to be collected.

W. W. S.—Address R. R. Haines, Superintendent Western Union Telegraph Company, San Diego, Cal.

FOREIGN TELEGRAPHIC ITEMS

THE EASTERN TELEGRAPH COMPANY.

At the half yearly meeting of the Eastern Telegraph Company, held in London on Friday, Jan. 24th, the report of the directors stated that the different sections of the cables continued in good working order. To carry out the objects sanctioned by the meeting of the company on the 6th of December, 1872, 30,000 of the unissued shares had been fully subscribed for by the shareholders. The manufacture of the Falmouth and Lisbon duplicate cable, by the Telegraph Construction and Maintenance Company, was being rapidly proceeded with, and it was anticipated that the line would be laid and in working order by July next. The gross receipts of the company for the six months ending 30th September, 1872 (less the loss on exchange and rent, and subsidies for land lines), amounted to £175,840, and the expenses, including income tax, to £42,939—leaving a balance of $132,901. The directors had already paid two interim dividends of 1½ per cent. each on account of profits, which absorbed £101,901, leaving £90,991 to be carried forward. The capital account showed a total expenditure of $3,442,461.

The Chairman, in moving the adoption of the report, said that they were making steady progress in the right direction. They thought they would be able to give a dividend of 8 per cent., but the net receipts were only equal to 7½ per cent. for the past half year. He had no doubt that it would be made up in the next six months. The gross receipts, for the six months prior to the amalgamation, amounted to £149,050, and, for the first six months after it, to £177,870—showing an increase of £28,870, or 19 per cent. They had reduced the tariff on messages to India to 10s. per word, but the traffic had not increased so much as they expected. Companies had been started with an ingenious system of packing, by which they managed to condense a number of messages into one. Telegraphy must go forward, and he had no doubt that the result of those operations would be to increase the business of the company. They had proposed to the Indian Government the "one word tariff," which worked so well on the Atlantic lines, but they did not see their way in the matter. The Egyptian tariff had been reduced from 30s. to 20s. for ten words, and if those reductions did not increase business in that proportion the dividend would not increase. The reductions in the tariff had not yet increased the traffic sufficiently to repay them. The cost of everything was more than formerly, and unless the traffic increased in proportion the dividend would not increase.

The Board of the Anglo-American Telegraph Company have resolved to recommend the declaration of a dividend of 4 per cent., and a bonus of 2 per cent., at the annual meeting of the 14th of Feb., making, with the three interim dividends of 2 per cent. each already paid, 12 per cent. per annum. This amount added to the Renewal Fund is £100,000, leaving a balance of £16,000 to be carried forward.

The directors of the French Atlantic Telegraph Company have declared an *interim* dividend of two per cent. for the quarter ended December 31.

A Conference has been held at Simla on the subject of amalgamating the Indian Telegraph and Postal Departments. We understand that Mr. Monteith has already submitted to Government a report, in which, while admitting the utility of the measure, so far as expenditure is concerned, he has observed that the success of the scheme in England furnishes no guarantee of its success in India, the circumstances of the countries being quite dissimilar.

The *Madrid Gazette* has published the royal decree granting to M. Lassarte the right to lay a submarine telegraph cable between Cadiz and Cuba. Another decree grants to the company which has the concession for laying a cable between Barcelona and Italy the right to erect a telegraph line between Madrid and Barcelona, to be exclusively reserved for the telegrams transmitted by that cable. The *Imparcial* announces that several English firms have made very advantageous proposals to the Spanish Government for the purchase of the Spanish telegraph lines, and for the working and maintenance of them.

There seems to be some contention as to the rights of establishing cable communication between the River Plate and Rio de Janeiro. Mr. Basil Holmes, Secretary to the Montevidean and Brazilian Telegraph Company, writes to say, with reference to a statement in the *London Times*, that a contract has been signed by Messrs. Siemens Brothers to lay a submarine cable between Rio Janeiro and Montevideo; his company now holds the exclusive concession for a telegraph cable from Montevideo to Brazil, and that the cable will be laid early this year. The final paragraph in the letter, however, seems to show that this concession is only from the Government of Uruguay, whereas a joint concession from Brazil and Uruguay will be necessary for the work, and such a concession is fully believed to be in possession of the Platino Brazilian Telegraph Company, with whom Messrs. Siemens are stated to have made a contract.

The cable across the Pentland Firth having been successfully laid, telegraphic communication is reopened between Great Britain and the Orkney and Shetland Islands.

The traffic receipts of the Great Northern Telegraph Company for the month of December amounted on the European lines, to 88,785f. (£3,551), and for December, 1871, to 79,483f. (£3,179), The receipts on the China and Japan lines amounted to 102,810f. (£4,112), and for the month of December, 1871, to 59,038f. (£2,361)—showing an increase of 43,772f. (£1,751).

The traffic receipts of the Eastern Telegraph Company for January amounted to £33,287, against £37,953 in the same month last year.

Another decree has been published by the Spanish Government, authorizing the Direct Spanish Telegraph Company to construct a line between the terminus of the cable at Irun and Madrid, to be reserved expressly for the use of the cable.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended the 11th January, was 275,341—an increase on the corresponding week of last year of 35,917.

The number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended the 18th January, 1873, was 283,679—an increase over the corresponding week of the previous year of 45,456.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended January 25th, 1873, was 289,173—an increase over the corresponding week of last year of 52,432.

The total number of messages forwarded from postal telegraph stations in the United Kingdom, for the week ending February 1, 1873, was 290,161—an increase on the corresponding week of last year of 43,829.

THE PROPOSED AMALGAMATION OF THE ATLANTIC CABLE COMPANIES.

There seems to be a revival of the agitation of the early part of last year in favor of amalgamation of the Atlantic Companies, which then resulted in only a very partial success. We cannot regard otherwise than with blank amazement the conduct of the directors in resisting for a moment such a desirable consummation. Can it be that they fear a reduction of the Boards and loss of fees? In no other way is it comprehensible. If so, we would recommend the shareholders to provide a handsome retiring allowance for any director whose continued services may not be considered necessary. We wish to point out what is lost by delay in completing the amalgamation. The Eastern Telegraph Company quietly completed its amalgamation of the Falmouth, Marseilles, Anglo-Mediterranean and British Indian cables a year ago. The £10 shares of the amalgamated company have reached £11—making £220 for the £100 stock of the Anglo-Mediterranean. The greater part of the receipts of this company depend on the single cable of the British Indian. The net revenue, without providing for reserve, is only a trifle over 8 per cent., yet the £10 shares are eagerly bought for investment at £11, or thereabouts. The revenues of the Anglo-American and French companies depend upon three parallel cables, and they amount for the past year to 17 and 18 per cent. on the respective capitals. The Anglo-American has a reserve of about 12 per cent. in hand, which could be divided before amalgamation, and, after deducting this, the price of its stock is only £125. If the public held it in the same estimation as Eastern stock, it would be over £200. In the same way of estimation French Cable shares would be £40, whereas they are only £25 *ex reserve!* We believe we are correct in saying that an amalgamation, issuing an amount of stock to yield 8 per cent. or so, is practically resolved upon, being delayed only till the French Company's second cable is laid. But wherefore delay for such a ridiculous reason? The risk of laying is only a matter of insurance, and seeing that the revenues are practically secure with three cables, the Anglo-American Company would be foolish to refuse the advantage it will get in the terms of amalgamation if it shares the risk of laying. We are glad to learn that the Great Western Telegraph Company is arranged with, and is to carry its cable elsewhere. The prospects of any single cable, against the united force of the Anglo and French would be miserable indeed.—*The Railway News.*

The report of the British-Australian Telegraph Company furnishes a balance sheet only to the 30th June, 1872, but states that the next accounts to be presented will show the results of the working of the cable from October 21, the date of the opening of through communication to Australia, to the 31st of December; that the gross receipts for the period during which the whole line was in operation in the year 1872, appear, from telegrams received, to amount to £11,658; that the question of amalgamation of the Trans-India companies has occupied the consideration of the Board; and that the terms upon which the directors will recommend this measure to the shareholders will be notified as soon as they are decided upon.

The German government has caused a telegraph station to be erected on the peninsula of Hela, which will enable vessels, in case of accident, to obtain assistance from Dantzig with the least possible delay.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
March 1, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Evansville, Ala., re-opened.
Yountville, Cal., closed.
Chillicothe, Ill., closed.
Literberry, Ill., closed.
Business for Biddeford, Me., should be checked to Saco, Me., at Saco rate.
Clear Fork, Mo., closed.
Lawrence, N. J., ck. Princeton Junction, N. J.
Newtown, N. J., ck. Hightstown, N. J.
Buiness for Old Bridge, N. J., will hereafter be checked to South Amboy, N. J., instead of Bordentown, N. J.
Black Lick, O., closed.
Corvallis, Or., closed.
Montrose. Pa., is now a W. U. Office, square 75.
Sandy Creek, Pa , closed.
Bloody Run, Pa., changed to Everett, Bedford Co.

NEW OFFICES.

557 Beaver Creek, Col.
288 Foresters, Ind.
376 Delhi, Iowa.
* Centre Waterboro, Me. 25 2 14 Portland, Me.
* East Lebanon, Me. 25 2 14 Portland, Me.
* South Waterboro, Me. 25 2 14 Portland, Me.
269 Berlin, Ottawa Co., Mich.
240 Fowler, Mich.
200 Romeo, Mich.
351 Taylor's Miss.
474 Saltillo, Neb.
* East Rochester, N. H., 25 2 14 Portland, Me.
47 Plainsboro, N. J., ck. Princeton Junc.
202 Big Walnut, Ohio.
201 Nankin, Ohio.
202 Summit, Licking Co., Ohio.
Rock Point, Or.
112 Everett, Bedford Co., Pa.
510 Sherman, Texas.
New Aukum, W. T.

OFFICES HAVING "SPECIAL SHEET A," will hereafter check Towsontown, Md., 20 cents more than Special rate to Baltimore, Md.

ATLANTIC CABLE BUSINESS.

The cable between Hong Kong and Shanghai is again in working order, and messages may be sent direct to Hong Kong, Shanghai and Nagasaki by the Russian, Falmouth or Teheren routes, or via Turkey.

The following changes in cable rates will take effect on and after March 1st, 1873:

From	To Great Britain and Ireland	To France.	
	For each Word.	For 10 Words.	For each Word over Ten
Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dacotah, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California, Arizona, Oregon and Washington Terr..	$1 25	$12 50	$1 25
British Columbia.....	1 35	13 50	1 35

WILLIAM ORTON, President.

EXECUTIVE ORDER No. 144.

On and after the first day of March so much of Executive Order No. 139 as relates to the booking, checking and reporting of Signal Service messages as D. H. is hereby revoked, and the provisions of Order No. 125 will hereafter apply to such business, except that bills will not be presented for payment by managers of offices.

The messages will be treated as if prepaid, credit will be taken for amount thereof by special entry in monthly report No. 4, and the originals, with statement of account, forwarded as vouchers.

WILLIAM ORTON, President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, Feb. 20th, 1873.

Towanda, Pa., in D. H. Bates' district, has been closed as a money order office.

G. H. MUMFORD, *Vice-Pres't.*

EXECUTIVE OFFICE,
NEW YORK, Feb. 24th, 1873.

From and after March 10th, *Sherman, Texas*, will be added to the list of money order offices in D. P. Shepherd's district.

G. H. MUMFORD, *Vice-Pres't.*

EXECUTIVE OFFICE,
NEW YORK, Feb. 28th, 1873.

On and after March 15th money order offices will be established at the following-named points in J. F. Wallick's district:

Anderson, Ind.	Greencastle, Ind.
Crawfordsville, Ind.	Kokomo, Ind.

G. H. MUMFORD, *Vice-Pres't.*

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS 37 & 38 TO FEBRUARY 24th.

The acknowledgment of receipt of any assessment is to be understood as an acknowledgment for all previous assessments.

J. D. Easterlin, Charleston, S. C., and W. W. Kelchner, Springfield, Ill., have been appointed agents of the Association.

THE TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

ORGANIZED IN 1867.

The heirs of deceased members receive one dollar from each of the surviving members of the Ascociation.

All engaged in the Telegraphic service are eligible to membership, if in good health and of good character and habits. Initiation fee $1.50.

Blank forms of Application and Restoration may be had of the Secretary, or of any of the following Agents:—

Augusta, Ga.,.....J. M. Crowley.
Baltimore, Md.,.....Archd. Wilson.
Buffalo, N. Y.,.....J. W. Tillinghast.
Cincinnati, O.,.....F. A. Armstrong.
Chicago, Ill.,.....W. C. Long.
Cleveland, O.,.....H. L. Melton.

(From the New York Ledger.)

JOSEPH PRIESTLEY.

BY JAMES PARTON.

Time brings its revenges. I read in a recent number of the London *Athenæum*, a quiet advertisement informing the public that "it is proposed to honor the memory of Dr. Priestley, and to commemorate his discoveries and his services to the scientific world by the erection of a statue in Birmingham, where he lived so many years."

The advertisement goes on to say that, as no other public memorial of Dr. Priestley exists, it is believed that a large number of persons interested in science will be glad to contribute something to perpetuate the memory "of the father of pneumatic chemistry, the discoverer of oxygen, and one of the most illustrious men of science whom the last century produced." Then follows a list of sixty-six subscriptions, varying in amount from fifty pounds to ten shillings. Among the names we recognize those of Professor Huxley, Mr. Martineau, Dr. Russell, Sir Rowland Hill, and several other members of the Royal Society.

A statute to Priestley in Birmingham! Does the reader happen to remember how Dr. Priestley left Birmingham seventy-nine years ago? July the 14th, 1791, some of the liberal people of that city proposed to celebrate by a public dinner the anniversary of the destruction of the Bastile, which had taken place only two years before. But two years in Revolutionary times is equal to a century. When the Bastile was destroyed in 1789, the event was hailed with joy throughout the world; but during the two days following, the revolutionists of Paris committed excesses which repelled and disheartened all but the staunchest friends of liberty---all but such as Priestley, who was recognized in Birmingham as a chief and representative of the liberal party. Priestley had published a reply to the "Reflections" of Edmund Burke. He had been named a citizen of the French Republic. He had defended the revolution in the local press.

The aristocratic fraction of Birmingham, whose instinct was then, and is now, to advance their cause by violence, determined to prevent the celebration. It is easy to stir up a riot in times of popular excitement, but it is not so easy to limit or check its ravages. After breaking up the banquet, and destroying the tavern in which it was given, the mob rushed to the house of Priestley, who had not attended the dinner, broke it open, and compelled the family to seek safety in flight. The rioters took out his books in armfulls—those precious books, the solace of his life, which he had been fifty years in gathering, for he was a hoarder of books from his infancy. His library was scattered over the road for half a mile, and his torn manuscripts covered the floors of his house. His apparatus was broken to pieces; and when the destruction of the interior was complete, the house was set on fire. The fire, however, was extinguished before further harm was done.

This disaster, strange to relate, made the philosopher's fortune; for although the jury, after a trial lasting nine years, awarded him but twenty-five hundred pounds damages, of his claim of more than four thousand, the liberal portion of the public subscribed handsomely to make good his loss. His own brother-in-law, as Lord Brougham tells us, gave him ten thousand pounds, besides settling upon him an annuity of two hundred pounds for life. As he already had a pension of one hundred and fifty pounds a year from Lord Shelburne, whose librarian he had formerly been, he was now in very liberal circumstances for a philosopher. In Pennsylvania, where he spent the residue of his life, such an income, at that period, was even superabundant.

There is an error in the advertisement quoted above. It is not true that no "public memorial" of Dr. Priestley has been erected. Every soda fountain is his monument; and we all know how numerous and how splendid they are. Every fountain, too, whence flow the home-made waters of Vichy and Kissingen, is a monument of Priestley, for it was he who discovered the essential portions of the process by which all such waters are made. The misfortune is, however, that, of the millions of human beings who quaff the cool and sparkling soda, not one in a thousand would know what name to pronounce, if he was called upon to drink to the memory of the inventor. And really his invention of soda water is a reason why Americans should join in the scheme to honor his memory. He not only did all he could to assist the birth of the nation, but he invented the national beverage.

Yet he always protested that he was very little of a chemist; and often said that his making chemical experiments at all was a kind of accident. A Yorkshire man by birth, the son of a cloth finisher, he was one of those boys who take to learning as a duck takes to the water. He was an eager, precipitant student from his childhood up. Not content with the Latin and Greek of his school, he must needs learn Hebrew in the vacations, and push on into other ancient languages of the East, Chaldaic, Syrian, Arabic, not neglecting such trifles as French, Italian, and German. This way of passing youth never fails to do lasting injury. He had an aversion to the sports of the playground, and to all the lighter literature. Need I say, then, that before he was eighteen years of age his health had completely broken down, and he was obliged to lay aside his books for months?

Beginning life as a Calvinist minister, he gradually adopted a milder theology—became, in fact, a Unitarian, and abandoned the pulpit for a time. Then he set up a school. He spent many years in teaching and writing school books, his first publication being an English grammar for children. At one school, where he taught for a while, a course of lectures was given on chemistry, a science of which he knew nothing, not even its object or nature. Attending these lectures, his curiosity was awakened and he began to experiment.

It was Dr. Franklin's influence, however, that weaned him from other subjects, and caused him to devote his main strength to science. In 1761, when Dr. Franklin was in London, Priestley who was in the habit of visiting the city once a year, sought the acquaintance of Franklin, and became intimate with him. Franklin related to him the history of those delightful six winters, during which he and his Philadelphia friends were experimenting in electricity. The young schoolmaster, who had already had some success in bookmaking, now offered to write a history of electricity, if Franklin would put him in the way of getting the material. Twelve months after Franklin had the pleasure of receiving from his industrious friend a copy of the work, one of those square massive quartos in which the science of that age was usually given to the world. In this work was printed, for the first time, a narrative of Franklin's immortal experiment with a kite, which Priestley received from the experimentor's own lips. It is a curious fact in the history of science, that Dr. Franklin himself never took the trouble to write out an account of this experiment—the most daring, ingenious and celebrated which science records. The work was remarkably successful, passing through three editions in nine years. From this time onward, Priestley was almost wholly a man of science, and no year passed without his adding something to human knowledge. He very greatly increased our knowledge of the air we breathe and its constituent gases.

He would have been even more successful, if he had been more favored by fortune. Being compelled, through his poverty, to spend a large portion of his time and strength in earning his livelihood, he could not follow out his discoveries, nor pursue them with that watchful calm so necessary for avoiding error, and perfecting truth. His zeal, however, made up in some degree for his lack of means, and the list of his discoveries will always invest his name with distinction.

Later in life, he accepted an offer to enter the service of the Earl of Shelburne, as librarian. He had better retained his poverty and independence. He groaned under servitude, and would have thrown up his employment sooner than he did, but for the advice of Dr. Franklin. Franklin told him to arrange all the reasons for keeping his situation in one column, and all the reasons for leaving it in another, then strike a balance, and so reach a wise conclusion. Priestley supported his servitude a while longer, but he was glad enough to retire, in 1778, upon a pension of one hundred and fifty pounds a year.

During the whole period of Franklin's residence in England, Priestley aided him by his pen and influence by opening the eyes of the public to the folly of the Ministry in estranging the American colonies. The last day of Franklin's stay in London, Priestley spent with him from morning to night, without interruption, looking over American newspapers just arrived. Franklin was completely overcome with the prospect of a civil war, and the dismemberment of the Empire.

"A great part of the day," says Dr. Priestley, "he was looking over some American newspapers, directing me what to extract from them for the English ones; and in reading them, he was frequently not able to proceed for the tears literally running down his cheeks."

The two friends never met again; for it was not until 1794, when Franklin had been dead four years, that the English philosopher landed in New York. He had a distinguished public reception in the city, and proceeding to Philadelphia, he was invited to become Professor of Chemistry in the University of Pennsylvania. He declined on the ground that he did not know enough of the subject. He refused also an offer, most munificent for that day, of a thousand dollars, for a course of scientific lectures in Philadelphia. His labors in America were chiefly theological, and he resided usually on his son's farm in Northumberland county, Pennsylvania. He died in 1804, aged seventy one. He was an immense personage in his day. The public were constantly reminded of his existence by some publication bearing his name. According to Allibone, he gave the public one hundred and forty one separate works.

A NEW WAY TO KINDLE A FIRE.

On the 26th of December a fire occurred in Goodyear's India Rubber Works, Naugatuck, Conn., which originated in an unheard of manner. In the proofs of loss the claimants make the following remarkable statement: The superintendent, who was in the room where the fire originated, and at the time, states that while one of the workmen was handing rubber goods the air seemed to be charged with electricity, it being in the midst of a violent snow storm, the mercury meanwhile being at or near zero; then there seemed to come from his hand a flame, which instantly communicated with the goods and dry pine of the building, the fire not being under their control for a moment. Others in the neighborhood received severe shocks of electricity on that day in their houses.—*Washington Star.*

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, MARCH 1, 1873.

DEPARTURE OF THE WESTERN UNION COMMISSION FOR EUROPE.

Mr. George B. Prescott, Electrician of the Western Union Telegraph Company, and Gen. Thomas T. Eckert, General Superintendent of the Eastern Division, sailed for Europe, on the steamship *Java*, of the Cunard line, on Wednesday, the 19th ult., upon their mission to examine the latest improvements in the telegraphic service there. It is not believed that the service in Great Britain, or, indeed, in any part of Europe, is, in any degree, superior to our own, but it is probable that there are a number of labor-saving devices in operation there which might be advantageously employed in this country. Should such prove to be the case, these devices will at once be introduced upon the lines of the Western Union Company.

The Commission will give especial attention to the employment of pneumatic tubes, which are being used in the principal places in Europe, in connection with the telegraphs, for the transmission of messages between the offices in the large cities, and also thoroughly examine the system of subterranean lines.

It is to be expected that much benefit will accrue to the service from the mission of Messrs. Prescott and Eckert. The practical knowledge of the telegraphic business possessed by these gentlemen will enable them to investigate into and decide upon the adaptability to our necessities of any improvements which may be found to exist.

MANAGERS of offices who may have accounts in error with Augusta, Maine, office, prior to November 1st, 1872, are notified that all communications upon such business should be addressed to J. S. Bedlow, Superintendent, Portland, Maine.

The usual course will be pursued with errors which have occurred subsequent to that date.

Executive Order No. 144, concerning the treatment of signal service business, appears on page 102.

THE supplementary tariff sheet which accompanies this issue of the JOURNAL, contains all changes of every nature which have been made since the issue of the present book of rates. Managers will carefully note all instructions therein contained.

THE DUPLEX TELEGRAPH.

One of the most important inventions for facilitating and cheapening the transmission of messages, which has been made since the first telegraphic apparatus was put into successful operation by Morse, has been acquired by the Western Union Telegraph Company during the past year. It is styled the "Duplex Telegraph," and is the invention of Mr. J. B. Stearns of Boston. By means of this apparatus, messages can be transmitted in opposite directions upon a single wire, at the same time. The first trial of this apparatus upon the Company's lines was made between New York and Albany in August, 1871. A second set was put on between New York and Boston on the 9th of October following. During the great pressure of business occasioned by the Chicago fire, these instruments rendered most important service under circumstances when it was impossible to provide for the sudden and unexpected demand for increased facilities by the erection of additional wires. They have since been introduced, and are now working successfully, upon circuits between New York and Buffalo, New York and Chicago, New York and Albany, New York and Cincinnati, New York and Syracuse, New York and Pittsburgh, New York and Baltimore, New York and Washington, New York and Philadelphia, New York and Long Branch, New York and Saratoga, New York and Boston (two circuits), New York and Plaister Cove, New York and Chattanooga, Boston and Portland, Sacramento and San Francisco, Buffalo and Chicago, Cincinnati and Chicago, Cincinnati and St. Louis, Cincinnati and Washington, Cleveland and Indianapolis, Pittsburgh and Chicago, St. Louis and Chicago, Philadelphia and Pittsburgh, and Philadelphia and Harrisburgh. But for the impossibility of getting the instruments manufactured, they would have been introduced upon many other circuits.

When it is considered that by this apparatus, in addition to doubling the capacity of the wire, there is saved the interest on the investment for the cost of an additional wire; the cost of maintenance, and the liability of wires to interfere with each other when a large number are crowded upon one line of poles, some idea can be formed of the value of this wonderful discovery.

The chief use of the "Duplex Telegraph" is upon circuits between cities which exchange more messages with each other than can be transmitted over a single wire. The number of such circuits is now somewhat limited, but they are rapidly increasing.

The number of messages transmitted by the lines of the Western Union Telegraph Company has doubled within six years, and it is believed that the increase during the same period in the future will be larger. The greatest increase of traffic will doubtless continue to be between the large cities and on routes some of which are already overcrowded with wires.

A peculiarity of the Duplex is that it can be substituted for the apparatus now in use, and worked in the ordinary way, at a comparatively small additional expense. It is thus always ready for an emergency; and by an exchange of signals calling for an additional operator at each end, and an adjustment which can be made in a minute, one wire is practically converted into two, not by doubling its capacity to send messages one way, but by enabling it to transmit at the ordinary speed both ways. The same operating table may be occupied for the transmission of messages upon two wires by the Morse system, or upon one by the Duplex. It has performed excellent service during the past Summer, between New York and Saratoga, and New York and Long Branch. Between these places there is a very heavy business during three months of the year, a moderate business during another three months, while for the remaining six months there is scarcely occupation for one wire. To provide the wires required for the maximum business during the shorter period, involves a large investment which yields no return for about three-fourths of the time. The adaptation of the Duplex to this part of the business is complete.

It is but justice to one of the ablest Electricians in this, or any other country, and one of the most faithful and capable of the Western Union Company's employés, that we should say here, that great as is the credit justly due the inventor of this apparatus, its present perfect adaptation to the use for which it is designed is largely due to the scientific and practical knowledge, the cheerful and earnest labors of Mr. George B. Prescott, the Company's Electrician.

The State Senate of Pennsylvania has passed a resolution of instructions to the Senators representing their State in Congress to vote against the Postal Telegraph Bill.

SINCE Mr. Creswell got the postal telegraphic bee in his bonnet, he has been as uneasy as the old woman of Mother Goose, who "would never be quiet." His latest move is to get Senator Stewart to bring in a resolution directing the postal committee to find out what it really costs to build and run telegraphs, and whether the existing companies have any rights that a progressive Postmaster-General is bound to respect.

A SHORT telegraph line, owned and operated by the Adirondack Railroad Company, extends north from Saratoga, N. Y., about 60 miles. Mr. Charles H. Ballard, of Saratoga Springs, N. Y., is superintendent. The stations on the line are South Corinth, Jessup's Landing, Hadley, Stony Creek, Thurman, River Side, The Glens, Schroon Lake, Pottersville and Chesterton.

IT is understood that on the closing up of the accounts of the New York, Newfoundland and London Telegraph Company, consequent on its recent transfer to an English company—the first step toward its complete amalgamation—a dividend at the rate of 12 per cent. for the remainder of the year 1872 has been declared.

Journal of the Telegraph---Supplement.

SUPPLEMENT No. 2 OF THE TARIFF BOOK.

This Supplement contains a full list of the names of new offices, ("additions") offices closed, and the general information given in the Supplement dated September 16, 1872, and the TARIFF BUREAU CIRCULARS issued since that date.

Offices whose Tariff Books have been corrected by the circulars, will have no other use for the Supplement than as a list for reference. Other offices whose books have not been corrected, and those offices opened since October 1, 1872, should carefully correct their books by this Supplement, and then keep it in their Tariff Book for convenient reference.

General Notice.—All Western Union rates which previous to February 1, 1873, were higher than $2.50 for ten words, have been reduced to that amount.

Offices in the Eastern, Central and Southern Divisions, whose rate to points West of Utah is $2.50, will charge at rate of $2.75 and 18 on messages RECEIVED COLLECT FROM such points, but on all other business the rate must not exceed $2.50 for ten words.

The asterisk (*) is used to denote other line offices.

INSTRUCTIONS.

PAGE VI.—Half-rate messages may be taken for, and received from offices in squares 509, 510, 511, and 587.

ALABAMA.

NOTE.—No business for other Line Offices in Alabama, Georgia, or Mississippi, will hereafter be sent via Chattanooga, Tenn.

THE WESTERN UNION COMPANY AND THE *ALTA CALIFORNIA.*

In the matter between the Western Union Telegraph Company and the *Alta California*, a newspaper published at San Francisco, which was recently deprived of the privilege of receiving dispatches free of cost over the Company's lines, General Superintendent Gamble publishes the following card :

TO THE PUBLIC.

OFFICE OF THE PACIFIC DIVISION W. U. T. Co.,
SAN FRANCISCO, January 21, 1873.

The *Alta California* of to-day publishes a long article in which it attempts to convey the false impression that the action of the telegraph company in terminating the *Alta's* Pacific Coast dispatches was prompted by the stand which the *Alta* has recently taken upon the postal telegraph question. The correspondence which they publish clearly shows the actual necessity for stopping their dispatches, as they acknowledge that they did not even make a partial payment until after receiving formal notice of intended stoppage of dispatches. Had the *Alta* published all the correspondence which passed during the year 1872, upon the subject of the non-payment of their bills, the fact would have been shown that their Pacific Coast dispatches were suspended from October 26th until October 31st, to enforce a settlement of their bills for the months of March, April, May, June, July, August and September ; and they were resumed only upon the assurance of the publishers of the *Alta* that the telegraph company should suffer no further annoyance in that respect.

It is a significant fact that the *Alta* did not favor the Postal Telegraph until after the above-mentioned transaction. Instead of meeting their obligations promptly, as they had promised, the publishers of the *Alta* paid us nothing on account of October, November and December bills until payment was again enforced in the usual manner. Having become wearied of the great difficulty and annoyance of collecting money from the *Alta*, the Company decided to dispense with their patronage, and notified them accordingly.

That the charge of malicious intent to injure the *Alta*, because of its position on the Postal Telegraph question is a mere subterfuge and entirely without foundation in fact, is further shown by the fact that only a few days prior to the stoppage of the *Alta's* dispatches we effected an arrangement—at commuted rates—to transmit Pacific Coast dispatches to the *San Francisco Chronicle*, a paper which was at the time and still is a strong advocate of Postal Telegraphy. If it were the policy of the Company to punish newspapers for advocating such propositions, it would have positively declined negotiations with the *Chronicle.*

The general press of the United States is divided upon the subject of Postal Telegraphy, and the Telegraph Company has not assumed to question the right of its newspaper patrons to advocate the scheme—they have only demurred in cases where wanton and malicious attacks were made on the credit of the Company because they insisted upon the payment of just dues for services rendered.

JAMES GAMBLE,
General Superintendent.

DOMINION TELEGRAPH COMPANY.

THE fourth annual meeting of the Dominion Telegraph Company was held at noon on the 12th of February, in the Company's offices, corner of Church and Wellington streets, Toronto.

Hon. John McMurrich took the chair, and opened the proceedings by stating the object of the meeting. He said he was pleased to see so many present, and that they could meet in their own premises on this occasion. The Directors had nothing very great to submit to them, but what would be submitted would be on the whole gratifying, They had now got over the centre, and the prospects of the Company were brighter than they had ever been before.

From the report submitted by the Directors, we gather that up to the close of the year 1870, the Company had erected 629 miles of poles, strung 1,116 miles of wire, and put 33 offices in operation in the Province of Ontario.

In the last Annual Report it was shown that the pole mileage had been increased to 1,176 miles, the wire mileage to 2,265, and the number of offices increased to 83 during the year 1871. The Company had also, within the same year, acquired by purchase, the Peoples' Line, thus extending their operations to the sister Province of Quebec, and adding to their working lines 334 miles of poles, 668 miles of wire, and 23 offices.

During the past season they have added to the pole mileage 667½ miles of poles, have strung 1,099 additional miles of wire, and opened 58 new offices.

In this is included 153 miles of poles and a double wire line from Ogdensburg to Oswego, built under a renewable lease of 99 years, from the Atlantic and Pacific Telegraph Company of the State of New York.

Authority was voted by the meeting to issue new stock to the amount of $100,000 for further extensions, and to cover a deficiency incurred in past operations.

Hon. John McMurrich was re-elected President ; John I. McKenzie, Esq., of Hamilton, Vice-President ; and James Michie, Esq., Treasurer.

THE GREAT WESTERN TELEGRAPH COMPANY.

THE Stockholders of the Great Western Telegraph Company met at Chicago, Ill., on the 29th of January, for the election of a new Board of Directors. About 300 subscribers were present.

The reasons for the meeting were briefly stated by Mr. J. Stark.

The President's report was called for and read by Mr. Gage. In reference to the charge of a fraudulent design to exclude the stockholders from participation in the management of the affairs of the company, the report stated that "The first By-law, adopted March, 1868, read as follows : 'The first annual meeting of the stockholders of the Great Western Telegraph Company shall be held within ninety days after the first division of two thousand miles of the Company's lines of poles shall have been equipped with wire, and on the second Tuesday in January each year thereafter, at two o'clock, at such place as the directors of the company may direct.' I would beg leave to state, that, at the time this By-law was adopted, it was not the intention to cut off a participation by the stockholders in the business affairs of the company. I am confident such a purpose never entered into the minds of the directors. It was decided that if some plan was not adopted to prevent the friends and advocates of powerful rivals from subscribing for a controlling interest, the plans and purposes of the Great Western Telegraph Company would be defeated at the outset of the enterprise. The United States, American, Illinois, and Mississippi, Pacific, and a large number of other telegraph companies, have, one after another, been absorbed, and it was thought practicable and easy to arrange the By-laws so as to prevent any interference by designing men, to pervert the establishment of our telegraph scheme. If, after the company had grown to a self-supporting and profitable position, the stockholders themselves chose to sell out their lines, they could do so. But the first directors intended to prevent such a calamity, and desired to hand over to the stockholders a range of lines worth controlling as soon as they could be built and put in operation."

The report of the Treasurer was called for, but he did not respond, and Mr. Gage said the Treasurer was absent ; and if he was there and reported, it would be a statement of so much money received, so much paid out, and nothing in the treasury.

Much dissatisfaction was manifested at this, and, after a long discussion, the following resolution was offered and adopted :

Resolved, That the Treasurer of this Company be requested to furnish to the directors of this Company a detailed financial statement of the condition of this Company, giving the amount and names of all persons who have paid money, and also the names of all persons to whom he has paid money, with the amounts paid each ; also, that he report the amounts of debt due from this Company, to whom due, and also the amounts of all judgments rendered against the Company, with the names of the plaintiff or plaintiffs.

At a meeting of the directors, held February 7, the following officers of the company were elected :

President—JOSHUA STARK.
Secretary and General Agent—O. D. BOND.
Treasurer—M. TABOR.
General Superintendent—A. H. BLISS.

THE SOUTHERN AND ATLANTIC TELEGRAPH COMPANY.

A circular recently issued to the stockholders of the Southern and Atlantic Telegraph Company by the President, Mr. James R. Crenshaw, approved by the Executive Committee, states that the company have now completed and in operation 1,603 miles of line, with 3,002 miles of wire, and have offices at twenty-three cities and towns, and have issued 17,356 shares of capital stock, or $433,900. When the extensions recommended are completed, and which can certainly be done by placing at par as many shares of the capital stock as will make a total issue of 24,000 shares, or $600,000, the gross receipts cannot prove less than $200,000 per year, of which, it is stated, one half would be net profit. and may double that.

THE ATLANTIC AND PACIFIC TELEGRAPH COMPANY.

At a meeting of the Trustees of the Atlantic and Pacific Telegraph Company, held at the executive office of the company in this city, on Friday, February 7th, the following officers were elected for the ensuing year: President, John Duff: Vice-President, William H. Guion; Treasurer, G. S. Bowdin ; Secretary, Alfred Nelson; Executive Manager, E. D. L. Sweet.

It appears from the report of the Executive Manager, Mr. E. D. L. Sweet, made to the stockholders at the annual meeting, held January 29th, that greater progress was made by the company in 1872 than in any previous year since its organization. During the year more than two thousand miles of line were added to those previously occupied by the company.

The company claims to be entirely free from debt of every description, and its affairs are represented to be in a healthy condition, and the business since April, 1872, has shown a considerable profit or surplus monthly. This surplus has been expended, under the direction of the trustees, in paying for the new lines, and in extensive improvements over the entire routes of the company.

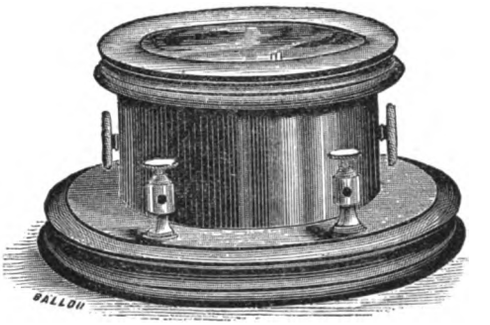
A NEW DESTINATION FOR THE PROJECTED GREAT WESTERN CABLE.



It is stated by the *Railway News*, of London, in its January 18th issue, that the opposition cable company, the Great Western, which was to have laid a competing cable during the Summer, has been bought off. The cable is already well advanced in manufacture. The *News* says:

"A short time since it was proposed, by an entirely independent company, to lay a cable between these countries and the United States, in competition with those of the Anglo-American and French companies. At the time the prospectus was published, we pointed out how little necessity there was for such an undertaking, especially as the French company was about to lay down a second cable, in accordance with the terms of its agreement with the New York, Newfoundland and London Tel. Co. We consider that four cables would, for some years to come, be amply sufficient to conduct the telegraphic business between Europe and North America; that the laying of the fifth would lead, for a time, to ruinous competition and eventuate in an amalgamation—in other words, there would be a greater amount of capital to participate in the net earnings, and a corresponding reduction of dividend. We now learn that the Great Western Telegraph Company themselves have come over to our views, for they have now determined to alter the destination of their cable, which is nearly finished, and employ it as a means of connecting us with Brazil and the Plate District, thereby rendering good service to the cause of progress in South America. The old companies are thus left in uncontrolled possession of the traffic to which their enterprise fairly entitles them—the Anglo-American Company and the French Atlantic collecting the business on this side of the ocean, to be distributed on the other side by the New York, Newfoundland and London Company, and receiving in their turn, all the messages collected on the American continent by that company, to be forwarded all over Europe and Asia—nay, even to the Antipodes.

M. A. BUELL,

Manufacturer and Dealer in

TELEGRAPH SUPPLIES.

THE LITTLE MONITOR RELAY

Is a substantially made and good working Instrument, incased in a polished Rubber Cylinder with Plate Glass Cover, has back and front Adjustment.

EVERY INSTRUMENT WARRANTED.

Price, $10.00.

Also, LITTLE MONITOR SOUNDER, to match,
Price, $6.00.

And Small Size W. U. KEY,
Price, $4.00.

All kinds of Learner's Instruments, with Instructions, constantly on hand. Send for Circular.

M. A. BUELL,
26 WARING BLOCK,
CLEVELAND, O.

THE

LECLANCHÉ BATTERY CO.

Is now prepared to supply promptly the increasing demand for

This Celebrated Battery,

(SECURED BY LETTERS PATENT IN THIS COUNTRY)

and which is extensively used throughout Europe for

TELEGRAPHY,
RAILROAD SIGNALS,
HOTEL ANNUNCIATORS,
BELLS, ETC.

Among the numerous advantages of this Battery may be mentioned—

ENTIRE ABSENCE OF ACIDS,
ITS GREAT CLEANLINESS,
WONDERFUL DURABILITY,
GREAT ECONOMY IN RUNNING EXPENSES.

This Battery will last, without any Attention, from six months to a year.

A number of cups have been in use by the Western Union Telegraph Company, *on a closed circuit*, since Nov. 26, 1872, nothing but water having been added since they were first set up.

For further particulars apply to

THE LECLANCHÉ BATTERY CO.,

No. 40 West 18th St., N. Y.,

OR

L. G. TILLOTSON & CO.,

SOLE AGENTS,

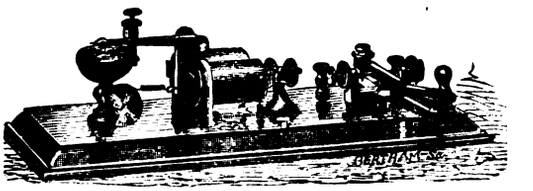
No. 8 Dey Street, New York.

WATTS & COMPANY,

Baltimore,

MANUFACTURERS OF

Electrical and Telegraph Instruments



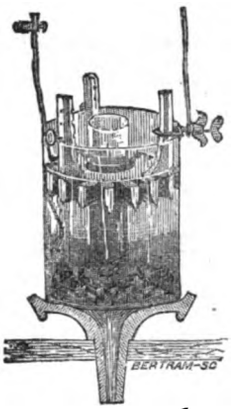
AND

MATERIAL OF EVERY DESCRIPTION,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc.

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER.



ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

SOLE MANUFACTURERS OF THE

NEW PATENT BALTIMORE BATTERY,

MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7½ inches,
Specially adapted to Railroad Signals, Printing Instruments, etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country, having proven the cheapest, and least trouble to maintain, of any in the market.

Patented Dec. 31, 1872.

ALSO, SOLE MANUFACTURERS OF THE

Patent Circuit Closer Key,
O'Sullivan Self-closing Key,
Scott's Patent Hotel Annunciator,

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE

PATENT BATTERY INSULATOR

shown, holding a cup of the Baltimore Battery in the above cut which most effectually insulates the Battery as the drip passes off *through a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. PRESCOTT, says of it:—"I think your Battery Insulator is very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.
Repairers' Tools constantly on hand.
Importers and Dealers in best English and American Galvanized Wire.

MANIFOLD PAPER, for Train Orders, etc. Also, AGATE PENS.

In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices.

Manufacturers and Dealers in

Telegraph Instruments and Supplies

OF EVERY DESCRIPTION,

194 Fulton Street, New York.

New and Superior patterns of

STANDARD TELEGRAPH INSTRUMENTS,

Their RELAYS, SOUNDERS, and KEYS which have been specially designed by Mr. F. L. Pope, are elegantly designed, thoroughly well finished and scientifically adapted to the service required and are recommended as SUPERIOR TO ANY HITHERTO OFFERED.

In addition to these ALL DESCRIPTION OF TELEGRAPH MATERIALS AND SUPPLIES are furnished, such as

INSULATORS, BATTERIES,
INSULATED WIRES,
CHEMICALS., ETC, ETC.

MAGNETIC AND DIAL INSTRUMENTS.

We have for sale also THE NONPAREIL TELEGRAPH INSTRUMENT for amateurs, learners and short lines.

A COMBINATION SET, comprising Sounder and Key on a handsome rosewood base.

Bradley's Box Relays and Sounders,
Bradley's Apparatus for Electrical Measurement.
Bradley's Naked Wire Helices and Magnet Spools to order, any desired size and resistance, at manufacturers' lowest price.

TELEGRAPHERS' EMPLOYMENT BUREAU,

TOLEDO, OHIO.

A Telegraphers' Employment Bureau has been established in this city, under the direction of several well known Telegraph Superintendents, having for its object the reception of applications for positions as operators, or operators and clerks or agents combined.

Applicants must state:

1st—Age. How long in the service. Reason for changing position. Present Salary. Sound or paper reader. Able bodied or otherwise.

2d—Applicants must send recommendations from present employer, or if not at work, from former employer as to moral character and capabilities. Recommendations to state if applicant is capable of filling positions other than operator, such as ticket agent, freight clerk, or agent.

This list will be published monthly and forwarded to the Superintendents of Telegraph Lines and a copy sent to each applicant whose name is printed thereon. All names to be published two (2) months. All applications to be accompanied by a fee of two (2) dollars.

Address,

Telegraphers' Employment Bureau
TOLEDO, O.

THE

ELECTRIC RAILROAD SIGNAL CO.

SPECIAL NOTICE.

OFFICERS OF RAILROAD COMPANIES, and others interested, are notified that this Company is the sole owner of the ORIGINAL PATENT for operating

ELECTRIC SIGNALS

by including a section of a railroad track in the electric circuit which was issued to F. L. POPE, July 16, 1872. Railroad Companies are **CAUTIONED** against negotiating with unauthorized parties for the use of this Invention, as this Company will take legal measures to protect themselves against all **INFRINGEMENTS.**

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 8. NEW YORK, MARCH 15, 1873. WHOLE NO. 129.

MEASUREMENT OF ELECTRICAL FORCES.

Coulomb, who was the first to make electricity an accurate science, employed in his researches an instrument which is often called after his name, and which is still extensively employed. It depends on the principle that the torsion of a wire is simply proportional to the twisting couple. We shall first describe it, and then point out some of its applications:

It consists of a cylindrical glass case A A (Fig. 1), from the upper end B of which rises another glass cylinder D D of much smaller diameter. This small cylinder is fitted at the top with a brass cap *a*, carrying an index C. Outside of this, and capable of turning round it, is another cap *b*, the top of which is divided into 360 equal parts. In the centre of the cap *b* is an opening through which passes a small metal cylinder *d*, capable of turning in the opening with moderate friction, and having at its lower end a notch or slit. When the cap *b* is turned, the cylinder *d* turns with it; but the latter can also be turned separately, so as not to change the reading. These parts compose the *torsion-head*. A very fine metallic wire is held by the notch, and supports a small piece of metal, through which passes a light needle of shellac *f*, carrying at one end a small gilt ball *g*. A circular scale runs round the outside of the large cylinder in the plane of the needle. Finally, opposite the zero of this scale, there is a fixed ball *g'* of some conducting material, supported by a rod *f*, of shellac, which passes through a hole in the cover of the cylindrical case.

To illustrate the mode of employing this apparatus for electrical measurements, we shall explain the course followed by Coulomb in investigating the law according to which electrical repulsions and attractions vary with the distance. The index is set to the zero of the scale. The inner cylinder *d* is then turned, until the movable ball just touches the fixed ball without any torsion of the wire. The fixed ball is then taken out, placed in communication with an electrified body, and replaced in the apparatus. The electricity with which it is charged is communicated to the movable ball, and causes the repulsion of this latter through a number of degrees indicated by the scale which surrounds the case. In this position the force of repulsion is in equilibrium with the force of torsion tending to bring back the ball to its original position. The graduated cap *b* is then turned so as to oppose the repulsion. The movable ball is thus brought nearer to the fixed ball, and at the same time the amount of torsion in the wire is increased. By repeating this process, we obtain a number of different positions in which repulsion is balanced by torsion. But we know, from the laws of elasticity, that the force (strictly the couple) of torsion is proportional to the angle of torsion. Hence we have only to compare the total amounts of torsion with the distances of the two balls. By such comparisons Coulomb found that the force of electrical repulsion varies *inversely as the square of the distance.*

The following are the actual numbers obtained in one of the experiments. The original deviation of the movable ball being 36°, it was found that, in order to reduce this distance to 18°, it was necessary to turn the head through 126°, and, for a farther reduction of the deviation to 8°.5, an additional rotation through 441° was required. It will thus be perceived that at the distances of 36°, 18°, and 8°.5,

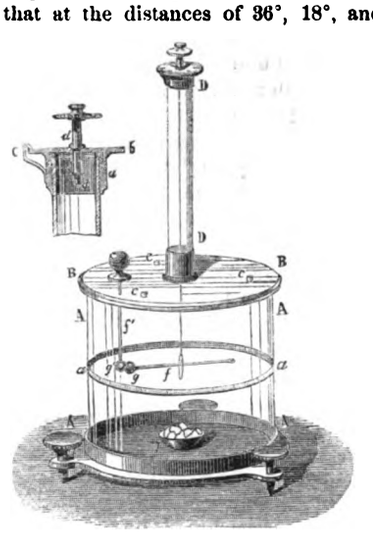

Fig. 1.

which may be practically considered as in the ratio of 1, ¼, and ¼, the forces of repulsion were equilibrated by torsions of 36°, 126°+18°=144°, and 441+126+8.5=575°.5 respectively. Now 144 is 36×4, and 575.5 may be considered as 576, or 36×16. Hence we perceive that, as the distance is divided by 2, or by 4, the force of repulsion is multiplied by 4 or by 16, which precisely agrees with the law enunciated above.

We must, however, observe that in this mode of reducing the observations, two inaccurate assumptions are made. First, the distance between the balls is regarded as being equal to the arc which lies between them, whereas it is really the chord of that

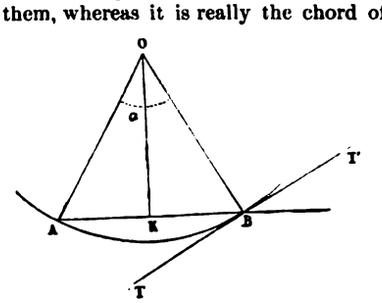

Fig. 2.

arc. Secondly, the force of repulsion is regarded as acting always at the same arm, whereas its arm, being the perpendicular from the centre on the chord, diminishes as the distance increases. The following investigation is more rigorous:

Let A O B (Fig. 2), the angular distance of the balls, be denoted by a, and let l be the length of the radius O A. Then the chord A B is $2l \sin \frac{1}{2} a$, and the arm O K is $l \cos \frac{1}{2} a$. Let f denote the force of repulsion at unit distance, and n the couple of torsion for 1°. Then the force of repulsion in the given position is $\frac{f}{4l^2 \sin^2 \frac{1}{2} a}$ if the law of inverse squares be true, and the moment of this about the centre is $\frac{f \cos \frac{1}{2} a}{4l \sin^2 \frac{1}{2} a}$, which must be equal to n A, if A be the number of degrees of torsion. Hence we have

$$\frac{f}{4nl} = \text{A} \sin \tfrac{1}{2} a \tan \tfrac{1}{2} a,$$

and as the first member of this equation is constant, the second member must be constant also for different values of A and a, if the law of inverse squares be true. The degree of constancy is shown by the following table:—

	a	A	A sin ½ a tan ½ a
1st experiment, . .	36	36	3·614
2d experiment, . .	18	144	3·568
3d experiment, . .	8·5	575·5	3·169
Supposed case . .	9	576	3·557

The difference between the first and second numbers of the last column is insignificant. That between the second and third is more considerable, but in reality only corresponds to an error of half a degree in the measurement of the arc.

We have already seen that the mutual induction of two conductors tends to diminish their mutual repulsion, and that this inductive action becomes more important as the distance is diminished. Hence the repulsion at distance 9 should be less than a quarter of that at distance 18. The apparent error thus confirms the law.

Many persons have adduced, as tending to overthrow Coulomb's law of inverse squares, experimental results which really confirm it. Except when the dimensions of the charged bodies are very small in comparison with the distance, the observed attraction or repulsion is the resultant of an infinite number of forces acting along lines drawn from the different points of the one body to the different points of the other. The law of inverse squares applies directly to these several components, and not to the resultant which they yield. The latter can only be computed by elaborate mathematical processes.

It is incorrectly assumed in the text that the law ought to apply directly to two spheres, when by their distance we understand the distance between their nearest points. It is not obvious that the distance of the nearest points should give a better result than the distance between the centres.

The law of attractions may be investigated by a similar method. The index is set to zero, and the central piece is turned so as to place the movable ball at a known distance from the fixed ball. The two balls are then charged with electricity of different kinds. The movable ball is accordingly attracted towards the other, and settles in a position in which attraction is balanced by torsion. By altering the amount of torsion, different positions of the ball can be obtained. On comparing the distances with the corresponding torsions, it is found that the same law

Digitized by Google

holds as in the case of repulsion. The experiment, however, is difficult, and is only possible when the balls are very feebly electrified. To prevent the contact of the two balls, Coulomb fixed a silk thread in the instrument, so as to stop the course of the movable ball.

We may assume as evident, that when an electrified ball is placed in contact with a precisely equal and similar ball, the charge will be divided equally between them, so that the first will retain only half the charge which it had before contact.

Suppose that an observation on repulsion had just been made with the torsion-balance, and that we touch the fixed ball with another exactly equal insulated ball, which we then remove, it will be found that the amount of torsion requisite for keeping the movable ball in its observed position is just half what it was before. The same result will be obtained by touching the movable ball with a ball of its own size. We conclude that, if the charge of either body be altered, the attractive or repulsive force between the bodies at given distance will be altered in the same ratio. The law is not rigorously true for bodies of finite size, unless the distribution of the electricity on the two bodies remains unchanged. When the two bodies are very small in all their dimensions in comparison with the distance between them, their mutual force is represented by the expression

$$\frac{qq'}{D^2},$$

q and q' denoting their charges, and D the distance. If this expression has the positive sign, the force is repulsive, if negative, attractive.

GIRDLING THE EARTH WITH WIRE.

With the exception of direct lines from the western coast of America to Asia, the girdle which good-humored Puck was to put about the earth seems to have been completed—the forty minutes the little sprite claimed to accomplish his work has been quite verified by the events and the labor of the present age. The wires of the telegraph are annihilating distance, aiding the laws, and bringing the nations of the earth into a companionship which compels a better understanding. When we can read in the morning papers the Australian news of yesterday, coming by way of London, leaving there at 3 A.M. of to-day, the triumph of science and the testimony of success to energy and perseverence is complete. North, East, South, and West—all are within a few hours' reach with the touch of the instruments, and the steady tapping of the telegraphic signal breathes the wishes of the world and the news of national or financial import with unerring promptness. The slender girdle which the wires spread makes all mankind close neighbors, and the bond of union which civilization is each day riveting should make us truer friends, and nobler toward each other.—*New York Commercial Advertiser.*

SIGNAL SERVICE BY PROFESSOR TYNDALL.

A press dispatch, dated at Washington, says:

At the request of the Chief Signal Officer of the Army, Professor Tyndall, now in Europe, has consented to superintend the device and construction of an electrical instrument to be used at the signal stations of the army, for making regular, simultaneous observations of the electrical condition of the atmosphere. It is hoped from the immense rapidity with which electric changes manifest themselves, a system of electric observations of approaching storms, far in advance of any hitherto had, may be established.

ON THE ELECTRICAL PROPERTIES OF CLOUDS AND THE PHENOMENA OF THUNDER STORMS.

By Professor Osborne Reynolds, M. A.

The object of this paper is to point out the three following propositions respecting the behaviour of clouds under conditions of electrical induction, and to suggest an explanation of thunder storms based on these propositions, and on the assumption that the *sun is in the condition of a body charged with negative electricity.*

1. A cloud floating in *dry* air, forms an insulated electrical conductor.

2. When such a cloud is *first* formed, it will not be charged with electricity, but will be ready to receive a charge from any excited body to which it is near enough.

3. When a cloud charged with electricity is *diminished* by evaporation, the tension of its charge will increase until it finds relief.

I do not imagine that the truth of these propositions will be questioned, but rather that they will be treated as self-evident. However, as a matter of interest, I have made some experiments to prove their truth, in which I have been more or less successful.

Experiment 1, was to show that a cloud in dry air acts the part of an insulated conductor. The steam from a vessel of hot water was allowed to rise past a conductor, the apparatus being in front of a large fire, so that the air was very dry. When the conductor was charged, the column of vapor was deflected from the vertical to the conductor, both for a positive and negative charge.

Experiment 2, was made with the same object as experiment 1. A gold leaf electrometer was charged so that the leaves stood open, and then a cloud made to pass by the insulated leaves. As the cloud passed they were both attracted. This experiment was attended with considerable difficulty, as the moisture from the steam seemed to get on the glass shade over the gold leaves, and so form a charged conductor between the leaves and cloud. The cloud was first formed by a jet of steam from a pipe, then by the vapor from a vessel of boiling water, and lastly, by a smoke ring, or rather a steam ring. By this latter method, an *insulated* cloud was formed, which, as it passed, was attracted by the charged leaf.

Of the two latter propositions, I have not been able to obtain any experimental proof. I made an attempt, but failed through the bursting of a vessel in which the cloud was to be formed. I hope, however, shortly to be able to renew the attempt, and in the meantime, I will take it for granted, that these propositions are true. Faraday maintained that evaporation was not attended by electrical separation, unless the vapor was driven against some solid, when the friction of the particles of water give rise to electricity. So that unless there were some free electricity in the steam or vapor before it was condensed, none could be produced by the condensation, and hence the cloud when formed would be uncharged.

In the same way with regard to evaporation, unless, as is very improbable, the steam into which the water is turned, retains the electricity which was previously in the condensed vapor; the electricity from that part of the cloud which evaporates must be left to increase the tension of the remainder. So that, as a charged cloud is diminished by evaporation, the tension of the charge will increase, although the charge remains the same.

I will now point out what I think to be the bearing which these propositions have on the explanation of thunder storms. In doing this, I am met with a great difficulty, namely: ignorance of what actually goes on in a thunder storm. We seem to have no knowledge of any laws relating to these every-day phenomena; in fact we are where Franklin left us—we know that lightning is electricity, and that is all.

It is not, I think, decided whether the storm is incidental on the electrical disturbance or *vice versa*, *i. e.*, whether the electricity causes the clouds and storm, or is a mere attendant on them. Nor can I ascertain that there is any certain information as to whether, when the discharge is between the earth and the clouds, the clouds are positive and the earth negative, or *vice versa*. Such information as I can get, appears to point out the following law: that in the case of a fresh-formed storm, the cloud is negative and the earth positive; whereas, in other cases, the cloud is positive and the earth negative.

Again, thunder storms move without wind, or independently of wind; but I am not aware that any law connecting this motion with the time of day, etc., has ever been observed, though it seems natural, that however complicated by wind and other circumstance, some such law must exist. In this state of ignorance of what the phenomena of thunder really are, it is no good attempting to explain them. What I shall do, therefore, is to show how the inductive action of the *Sun* would necessarily cause certain clouds to be thunder clouds in a manner closely resembling, and for all we know, identical with, actual thunder storms.

In doing this, I assume that the thunder is only an attendant on the storm, and not the cause of it; and that many of the phenomena, such as forked and sheet lightning, are the results of different states of dampness of the air, and different densities in the clouds, and really indicate nothing as to the cause of electricity. In the same way, the periodicity of the storms, is referred to the periodical recurrence of certain states of dryness of the atmosphere. Thus, the fact that there is no thunder in winter, is assumed to be owing to the dampness of the air, which allows the electricity to pass from and to the clouds quietly. What I wish to do, is to explain the cause of a cloud being at certain times, in a different state of electric excitation to the earth and other clouds, and of this difference being sometimes on the positive side and sometimes on the negative, that is to say, why a cloud should sometimes appear to us on the earth to be positively charged, sometimes negatively, and at others not to be charged at all.

The assumed condition of the sun and earth may be represented by two conductors S and E, acting on one another by induction, the sun being negative and the earth positive. The distance between these bodies is so great that the inductive action would not be confined to those parts which are opposed, but would in a greater or less degree extend all over their surfaces, though it would still be greater on that side of E, which is opposite to S, than on the other side.

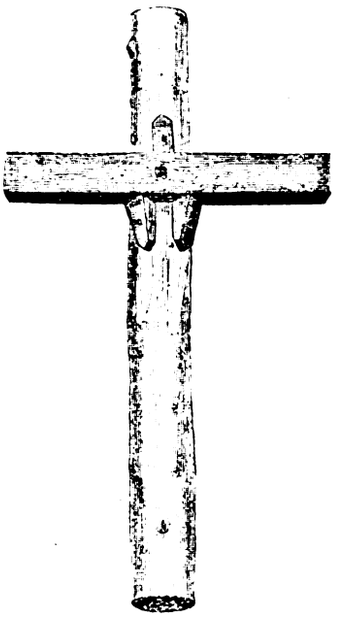
The conductor E must be surrounded by an imperfectly insulating medium to represent damp air. The formation of a cloud may then be represented by the introduction of a conductor C near to the surface of E. Such a conductor at first having no charge, would attract the positive electricity in E, and appear by reference to E to be negatively charged. If it was near enough to E, a spark would at once pass, which would represent a flash of forked lightning. If it were not near enough for this, it would obtain a charge through the imperfect insulation of the medium. Such a charge might pass quietly, or by the electric brush. When the cloud had obtained a charge, it would not exert any influence on the earth, unless it altered its position. But if the heat of the sun caused part of the cloud to

Digitized by Google

evaporate, the remainder would be surcharged and appear positive. Or if C approached E, then C would be overcharged, and a part of its electricity would return, and on its return it might cause positive lightning. Thus, suppose that after a cloud had obtained its charge, part of it came down suddenly in the form of rain. As the rain came lower its electric tension would increase, until it got near enough the ground to relieve itself with a flash of lightning, almost immediately after which the first rain would reach the ground. It has often been noticed that something like this often takes place; it often begins to pour immediately after a flash of lightning, so much so that it seems that the electricity had been holding the rain up, and it was only after the discharge that it could fall. This, however, cannot be the case, for the rain often follows so quickly after the flash, that there would not have been time for it to fall from the cloud unless it had started before the discharge took place. If, on the other hand, C receded from E, it would again be in a position to accept more electricity, or would again become negative. In this way, a cloud in forming, or when first formed, would appear negatively charged; soon after it would become neutral, and then if it moved to and from the earth, it would appear positively or negatively charged.

If the air was very dry, as it is in the summer, any exchange of electricity between the earth and the cloud would cause forked lightning, in the winter it would take place quietly, by the conduction of the moist atmosphere.

In this way, then, there would sometimes be positive, sometimes negative lightning; sometimes the discharge would be a forked flash or spark, sometimes a brush or sheet lightning. And if clouds are formed in several layers, as would be represented by another conductor, D, outside C, then, in addition to the phenomena already mentioned, similar phenomena would take place between C and D; and if, in addition to this, we were to assume that there are other clouds in the neighborhood, the phenomena might be complicated to any extent.



And if, further, the motion of the sun is taken into account; as the conductor S moves round E the charges in D and E would vary, accordingly as they were more or less between S and E and directly under the induction of S; *i.e.*, the charge in a cloud would appear to change owing to the motion of the sun; thus, a cloud would appear to change owing to the motion of the sun; thus, a cloud that appeared neutral at mid-day would, if it did not receive or give off any electricity, become changed positively in the evening.

With regard to the independent motion of the clouds, there are several causes which would effect it. For instance, a cloud, whether it appeared on the earth to be negatively or positively charged, would always tend to follow the sun, though it is possible this tendency might be very slight. Again, one cloud would attract or repel another, according as they were charged with the opposite or the same electricities; and in the same way a cloud would be attracted or repelled by a hill, according to the nature of their respective charges.

Such, then, would be some of the more apparent phenomena under the assumed conditions. So far as I can see, they agree well with the general appearance of what actually takes place, but, as I have previously said, the laws relating to thunder storms are not sufficiently known to warrant me in doing more than suggesting this as a probable explanation.

In these remarks I have said nothing whatever about what is called atmospheric electricity, or the apparent increase of positive tenison as we proceed away from the surface of the earth. I do not think that this has much to do with thunder storms. If the law is established, it seems to me that it will require some explanation, besides merely that of the solar induction acting through the earth's atmosphere on to the surface of the earth. It would rather imply that the sun acts on some electricity in the higher regions of the earth's atmosphere, and that electricity in these regions acts again on the surface of the earth; but, however this may be, the effect of the assumptions described in this paper would be much the same.

HOW TO ATTACH CROSS-ARMS TO STANDING POLES.

The above cut illustrates a new device for fastening cross-arms to poles, without notching them. The plan consists in flattening or blazing the side of the pole with a hatchet or draw-knife, bolting on the cross-arm, and then nailing two short oak brackets below the cross-arm, flaring outward, and one above directly over the bolt.

This plan makes a stronger support than any notch or gain, retains full strength of pole, costs less than notching, and its only apparent objection seems to be in the question of looks; but as we usually learn to like the looks of a thing which serves a good purpose we may come in time to regard this, if not actually handsome, not altogether ugly. The nail holes are bored on a slant, so as to draw the blocks so firmly against the cross-arm that it cannot wiggle.

The idea was suggested by the recent order concerning the use of cross-arms in place of brackets. That order, by the way, did not correctly convey the meaning intended, which was the following: Wherever there are two wires on brackets, or bracket and pin, and a third is to be added, a cross-arm must be used, and one of the two transferred to it. In cases where there are three wires on brackets, it is ordered that two of them shall be transferred to a cross-arm as fast as the work can be done without neglecting regular construction. The change should be made first upon the most important lines and those most likely to have other wires added.

This plan is to be adopted for all work where the standing poles are too small to bear cutting, and is authorized in other cases, as may be deemed desirable, by the Superintendents.

AN ELECTRICAL TOWER.

Mr. William H. Ward, of Auburn, N. Y., has suggested an electrical tower for accumulating natural electricity for telegraphic purposes. The structure, which is to be placed on high mountain peaks or other elevated stations, is to be made in three sections. The lower portion is a mere shell, containing a door; above this, and insulated from it by a diaphragm, is the middle part, in which are openings or windows having slats pivoted in them, so that, by means of raising or lowering rods suitably connected to such shutters, the openings may be shut or opened. A projecting roof extends over the windows, serving to protect them from the weather, and also for receiving the aerial electricity which may be drawn from it by wires for land line purposes. Above this roof is another insulating diaphragm: The highest portion of the tower is surmounted by a bent ventilating tube and vane, so arranged and connected with the rods acting upon the shutters, that the revolution of the vane by the wind will open the windward and close the leeward slats; the wind, therefore, assists in driving an aerial current of electricity into the insulated middle portion of the tower, which current passes upwardly through the upper portion of the tower and out through the ventilator, thus forming a draft by means of which the electrical current is forced out at the vane. Insulated wires, leading from the top portion of the tower, allow a supply of electricity to be drawn therefrom.

By the use of the aerial electricity which surrounds the earth in the upper strata of the atmosphere, the inventor considers that artificial batteries may be entirely dispensed with, and a circuit formed merely by connecting the aerial current with the earth current. For instance, to bring Buenos Ayres, in South America, in direct connection with New York, the following plan would be pursued: One electrical tower is erected on Pike's Peak, or any other suitable high mountain in North America, and another similar tower on some suitable peak of the Andes, in South America. The former would, by means of land lines, be connected directly with Denver, which place is again connected with all the prominent cities of the States. In a similar manner the southern tower is connected by land lines with prominent cities *via* Quito. New York telegraphs to the tower on Pike's Peak, and the operator, having connected the land lines with the aerial current, the signals are transmitted through the aerial current to the town in South America, and thence—the land lines being suitably connected—to Quito and Buenos Ayres.—*Scientific American.*

A SUGGESTION TO TELEGRAPH CONSTRUCTORS.

A writer in the *Western Rural* says: "Take boiled linseed oil and stir in pulverized charcoal to the consistency of paint. Put a coat of this over the timber, and there is not a man who will live long enough to see it rotten. I discovered many years ago that wood could be made to last longer than iron in the ground, but thought the process so simple and inexpensive that it was not worth while making any stir about it. I have taken out basswood posts, after having been set seven years, that were as sound as when first put into the ground. Time and weather seemed to have no effect on them. The posts can be prepared for less than two cents apiece." They should be well seasoned before the oil and charcoal are applied.

CORRESPONDENCE.

PROPOSITION TO CHANGE THE ALPHABET.

To the Editor of the Journal of the Telegraph :

I think statistics will sustain my statement, that three-fourths of our "bulls" arise from our spaced letters. The fact has been known to some extent for years, but efforts to change it, being spasmodic and not general, have uniformly resulted in failure.

Now that nearly all lines in the country are in the hands of one corporation, it will be easy to make the change.

The European Morse Alphabet, although in the aggregate longer than ours, is written as rapidly, as there are no spaced letters to be drawn out longer. As it is a combination of dots and short dashes, it can be read much faster than ours.

My idea of changing would be this: Notify all offices by circular, that after the first day of January, 1874, the European Alphabet—or some modification cutting out our present spaced letters and *l*, would be used only on the Company's lines—that all operators not using it at that date would be assessed ten per cent. on their salaries, until they were competent to use it. Long before that time, it would be in common use.

It is really a trifling matter to adopt the new one; all operators could learn it in a few days, and write it in two weeks. It only requires that the order be given and enforced. The opposition companies should be invited to join in the movement, and then operators would learn at once, for obvious reasons.

I have not conversed very generally with telegraphers about this, but those to whom I have explained it endorse it heartily. H.

APPRECIATION.

PORT HASTINGS, C. B., Feb. 12, 1873.

To the Editor of the Journal of the Telegraph :

As one who has served a long time in the telegraph ranks, and who has from the start labored, not merely to keep pace with, but to be in advance of, the requirements of the service, I trust it will not be out of place for me to express my gratification at the constant improvement in your paper, and to bid you "God Speed" in your good work. Such sources of information were not open to us in the early days of my telegraphic life. I well remember how much they were needed, and heartily congratulate my younger brethren on their superior advantages. The knowledge *we* have had to *work* for, is ready-made to their hands.

I have always had access to the JOURNAL, but as it is now, I must have a copy of *my own*.

JAS. C. UPHAM.

ALPENA, Mich, Feb. 26th, 1873.

To the Editor of the Journal of the Telegraph :

An attorney leaves a message for transmission signed by another party, for whom he is doing business, and directs answer to be delivered to him, or at his office. Should it be so delivered; or to party addressed?

Answer.—Rule 52 reads: "All messages must be promptly delivered to the parties addressed, or, in their absence, to their agents, clerks, or some member of their family, and a receipt taken for the same."

It does not appear that this attorney is an "agent" within the meaning of the rule, therefore the message in answer should not be delivered to him, unless directions in writing are given to that effect, by the party signing the original message

UPON THE IMPERFECTIONS OF OUR ALPHABET.—A CHANGE RECOMMENDED.

To the Editor of the Journal of the Telegraph :

There are perhaps a great number of our telegraphic brethren who will honestly differ with the writer in their opinion of the subject which is here put before them.

It is assumed, at the outset, that the spaced letters of the Morse Alphabet constitute in it a great point of weakness, and upon this ground we have seen in the past, several propositions for the substitution either of another alphabet, or of other combinations for the spaced letters. The Bain alphabet was once considerably in favor; and an alphabet arranged by H. M. Schieffelin, Esq., was for a time in partial use between Boston and New York, upon the lines of which he was President.

The proposition, now again agitated, is a change of alphabet; and it is well to consider what should be adopted.

In Europe and the East, the general system of rules and regulations is determined by a Congress. It will suggest itself to every one that a great and desirable good would come out of such a gathering, and that is *uniformity as to the methods of dealing with the business.* As a matter of course a uniform alphabet has been adopted.

The Telegraphic field is greatly enlarging. but American operators are confined, by their alphabet, to American soil. The time is near when Americans will be desirous of taking hold of Cable Circuits, or of lines in other countries. The alphabet now used in Europe is used in every quarter of the globe with the exception of America. On the Atlantic cables; in Great Britain and Ireland; throughout the European continent, and through Asia and Africa, and also on the cable routes to the East, from Falmouth *via* Lisbon and Gibraltar, through the Mediterranean and the Red Sea to India, China and Japan; on the lines to and in Java and Australia; on the West India and South American cables. In fact everywhere but in America, there is a uniform alphabet.

It would be wise for American authorities, and advantageous to employees, to secure the adoption of an alphabet uniform with other nations. The American Morse Alphabet is defective, as before indicated. Besides, its range does not cover the accented letters of the French and German languages, which in International business are often employed.

Whether to amend our present alphabet and send representatives abroad to interview the *Crowned heads* on the topic of its adoption in their realms, or whether we shall gracefully fall in and adopt their alphabet; or still again, whether we shall convoke a Congress of all nations, on a motion to make something entirely new, is the question now before us.

As our alphabet, in its present shape cannot be adopted, it follows that *we* must change. Since we are looking to the good of the *whole* and trying to take an enlarged view of the matter, it seems best to make as little disturbance as possible.

The European alphabet is altogether the most extensively used. It is adapted to both land and sea lines. It can be used on the Morse, on the Mirror, on double and single needles or bells. It is arranged scientifically, and meets what is needed in a uniform alphabet. Shall we not put aside our prejudices and with one voice show our willingness to adopt it?

H. H. W.

BINGHAMTON, N. Y., March 8, 1873.

To the Editor of the Journal of the Telegraph :

Are Telegraph Companies compelled by law to deliver messages to any point within city limits (without regard to distance) free of charge?

S. H. G.

Answer.—No.

To the Editor of the Journal of the Telegraph :

A man came into our office, wrote a message which contained a falsehood, and paid for its transmission. Being acquainted with the man, and knowing that the sending of such a message would injure him, as every lie will sooner or later, I went to him and persuaded him to let me tear it up, which was done, before it was transmitted. My manager now makes me pay for it, on the ground that the Company loses by my interfering with the sending of the message.

What is your opinion of the case? Cannot the Company well afford to do without such business?

OPERATOR.

Answer.—You were wrong in interfering. The Company cannot assume to judge as to the proper reading or the morality of messages offered for transmission. It can only be required that messages shall be couched in language free from profane or indecent expressions.

To the Editor of the Journal of the Telegraph :

If message comes collect half-rate, and in meantime, party comes in and asks if anything for him; should I deliver message and charge full rate?

Answer.—Yes, if it is requested. You should not offer to do so, however.

MIAMI, Mo., Feb. 27, 1873.

To the Editor of the Journal of the Telegraph :

I received the following message for transmission: "Ship to-night on No. twelve, three cars hogs, one of cattle."

Receiving operator refused to take the message, and insisted that I must spell "No." in full (Number). Was he right in refusing to receive the message as it was written? W. H. S.

Answer.—The receiving operator should have taken the message as it was sent to him. The refusal to receive it, unless it be made to conform to his ideas of what was proper, cannot be justified. The matter should be referred to your Superintendent, in order that he may put in force measures to prevent a recurrence of such evident stupidity. Rule 24 provides that "messages must be sent as they are written." Rule 20 contains a clause to the effect that "no office shall refuse to receive and forward or deliver any message from any other office unless it should endanger life or property."

To the Editor of the Journal of the Telegraph :

Suppose that the body of a paid message, in passing over this line, should be given to an editor by an operator in a repeating office, and published in a newspaper on account of the bad spelling and ludicrous character of the message. Would it not be a violation of Rule 102 of the Book of Regulations?

Is there any rule that allows a repeating office to publish private dispatches, if they happen to be *funny?* ***

Answer.—Such a proceeding is a violation of the rules. There is no rule which allows the publication, by any office, of the contents of any message, whether funny or otherwise.

JACK.—Any superintendent can inform you of the range of salaries in his district for good operators. First-class operators are always in demand.

F. P. D.—The reduction of rates to $2.50, applies only to offices upon the Western Union lines. Tariffs for "other lines" remain unchanged.

W. X. C.—An operator capable of receiving between twenty-five and thirty words per minute, by sound, may be deemed to possess fair ability, and could probably fill, with acceptance, a position in any office in New Jersey.

FOREIGN TELEGRAPHIC ITEMS

THE BRAZILIAN CABLE.

An important undertaking, entitled the Brazilian Submarine Telegraph Company (Limited), has been introduced under influential auspices, to establish under exclusive concessions for twenty years from the Emperor of Brazil and the King of Portugal, telegraphic communication with Brazil and the adjacent republics of South America. The capital is £1,300,000, in shares of £10 each. The concessions now held by the contractors will be vested in the undertaking. At Lisbon a junction will be formed with the system of the Eastern Telegraph Company, which is about to lay a duplicate cable from Lisbon to Falmouth, thereby ensuring a rapid transmission of this company's messages to and from England. The Brazilian concession includes the right to lay cables along the coast of Brazil, subject to a previous concession also held by the contractors. This company have entered into negotiations with the Great Western Telegraph Company (Limited), for that company to lay lines, under the powers referred to, along the whole coast from Para to Rio Grande do Sol, a distance of about 4,000 miles. That company has already over 2,000 miles of cable manufactured, and the shareholders have authorized their directors to negotiate for undertaking that line. The Brazilian Submarine Telegraph Company is prepared to enter into a working agreement with the Great Western Company, including an exchange of gross revenue to the extent of one-third, subject to such a complete coast system being established, failing which, the Brazilian Government will construct an efficient system of land lines Buenos Ayres is already connected by cable with Monte Video, and the Monte Videan Government has granted concessions for cable connection with Brazil, so that the important international traffic of the River Plate is also expected to accrue to this concern from the time of opening the line. A land line from the Argentine Confederation to Chili is, moreover, in working order, and will be another feeder. The cables will be laid in three sections—the first from Lisbon to Maderia, 633 miles in length, in July next; the second from Maderia to St. Vincent, 1,260 miles, in September, and the third from St. Vincent to Pernambuco, 1,953 miles, in May, 1874. The cables will be of the best construction, with improvements on the types of the Atlantic cables, and the contractors propose employing the Great Eastern in laying the deep-sea portion of the line. The contract price for making and laying the cable is £1,280,000, of which £880,000 is payable in cash, and £400,000 in fully paid-up shares.

RIVER PLATE AND BRAZIL TELEGRAPH.

This enterprise is the fitting complement of the Brazilian cable project, which was brought before the public last week, and was received with such marked favor, it being intended to continue that line of communication from Rio de Janeiro, the terminus of the cable, to the cities of Monte Video and Buenos Ayres, and the Argentine and Uruguayan States. The company for this purpose was formed some time since in Rio de Janeiro, under influential auspices, and one half of the capital of £400,000 at once subscribed there, the remaining £200,000 was being now offered for public subscription. The company has secured the exclusive privilege from the Imperial Government of Brazil, for a period of forty years, of laying a sub-marine cable between the points named; while concessions have also been granted to the same effect by the Government of the Republic of Uruguay for a similar period, and by the Argentine Republic in perpetuity, with further authorization of the construction and working of a system of land-lines throughout that Republic, which will afford communication with Valparaiso and the important districts in Chili. The lines in Uruguay and Brazil, under the concession, revert to the Government at the end of the term of years, and their cost will thus be provided for by a reserve fund of 10 per cent. An agreement has been entered into upon equitable rating terms, for the amalgamation of the Montevidian and Brazilian cable with the company's system, which will thus consist of 1,400 miles of sub-marine cable, and 710 miles of land-lines. Contracts have been made for the construction of the cable, under the superintendence of Sir William Thomson and Professor Jenkin, with Messrs Siemens Brothers, who have engaged to lay the same by the 15th August next. The land lines are now under construction. The report estimates the net earnings of the system of lines at upwards of 23 per cent. on the outlay. There can be no doubt that the line forming the sole cable communication between Rio de Janeiro, Buenos Ayres, and Monte Video, and connecting the latter towns and the important towns on the Western coast of South America with Europe, by means of the Brazilian cable, is admirably situated for a large and increasing business.

THE report of Hooper's Telegraph Company (Limited), to be submitted to the meeting on the 20th instant, shows a profit for the year of £69,177, leaving, after deducting the proportion due to Mr. Hooper, £41,950, for apportionments; of this 7s. per share was distributed in July last, and a further dividend of 13s. 6d. in cash is shortly to be paid, and a bonus is to be appropriated of 542 fully paid-up shares of £20 each, of the Great Western Telegraph Company (Limited). The dividends and shares to be placed in trust represents a total distribution for the year of rather over 17 per cent., free of income tax.

A PROSPECTUS of the Direct Spanish Telegraph Company (Limited), has been issued, with a capital of £130,000, in 13,000 shares of £10 each, to acquire and work a submarine cable already laid between Spain and Great Britain. This cable, having been tested, was opened for traffic on the 31st of December last, and has since been working uninterruptedly; the price required for the cable, its land connection at Bilbao and the Lizard, instruments, and all appliances for working, is £112,000. All concessions and grants, private or official, will also be transferred to the Company without further payment.

THE Atlantic Telegraph Company are about to permit the astronomers of various countries to transmit their observations through their cable free of charge, the transmission by post having long been regarded as injurious (through the length of time which elapsed) to the interest of science.

THE proposal for a working agreement between the China Submarine and the Great Northern Telegraph Companies has been carried out. By its provision, the tariff, for messages of 20 words to and from China and Japan, is fixed at £6. When interruptions arise the company, upon whose line they occur will cease to participate in the receipts until such time as communication is restored. The agreement is to remain in force for three years, and will come into operation immediately upon the Russian Government intimating its consent to the tariff being fixed at £6. Every exertion would be made to guard against any interruptions in the service, and thus to afford that thoroughly reliable communication which is so important to the interests of the mercantile community of China; and, if it should be found necessary, as a means towards carrying out this end, a duplicate cable would be laid between Hong Kong and Shanghai. It was urged that steps should be taken to insure the speedy completion of the extension which will connect the coast ports, Amoy, Foochow, &c., with the main line.

THE London *Times* says that the recent transmission of the Queen's speech throughout England evidenced some very rapid telegraphing. The document contained 858 words, and reached York, a distance of about 200 miles, in six minutes and a half. Wheatstone's automatic instruments were used. The above is at the speed of 132 words per minute.

MIDDLESBOROUGH EXCHANGE, with its numerous iron offices, is being run into from every direction with private telegraph wires. Messrs. Sanderson & Proctor, of Huddersfield, are erecting one line of these for the Lackenby Iron Company, and another for the North Yorkshire Iron Company, to communicate between works and head offices. The same firm is also introducing into the offices of Bolckow, Vaughan & Co., and others, a system of electric signals. By this means electric bells may be made to sound in all the workshops simultaneously, for leaving off and resuming work. If all adopted this plan it would be a great improvement on the buzzers, which make about the most discordant noise it is possible to make with sound.

A CIRCULAR issued recently by the West India & Panama Telegraph Company (limited), indicates that the directors have, for some time past, been striving to effect an arrangement for completing their system of cables, which they hope will soon be sufficiently matured for communication to the shareholders.

THE Brazilian Government are about to take the initiative in an important measure for the protection of cable property, having, under the concession for the Brazilian Submarine Telegraph, engaged to cause the neutrality of the cable to be guaranteed by international agreements.

THE steamer La Plata having successfully relaid the cable between the Orkney Islands and the main land, has proceeded to Shetland to repair the cable there, and upon her return will relay the former cable in the Pentland Firth.

IT is officially announced that the average time taken in transmitting messages from any postal telegraph station in the United Kingdom to Bilbao, in Spain, by the Direct Spanish Telegraph Company's cable, is one hour and twenty-nine minutes, and that the earnings accruing to the company during the last ten days have amounted to £329 3s. 6d.

THE following is a statement showing the total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ending the 8th of February, 1873, and during the corresponding week of 1872:—Total number of messages for the week ending February 8, 1873, 293,990; corresponding week last year, 250,776; increase in the week of 1873 on that of 1872, 43,214.

THE following statement shows the total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended February 15, 1873, and during the corresponding week of 1872:—February 15, 1873, 292,447; February 17, 1872, 240,694, showing an increase in the week of 1873, on that of 1872, of 51,753.

THERE are now 55,015 miles of telegraph wires in Chile.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
March 15, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Hereafter all messages for Union Springs, Ala., must be pre-paid Tariff for other lines, 135 and 8. Half-rate messages will no longer be received from, or taken for, that office.

The "tariff for other Lines" to Fernandina and Gainesville, Fla., will hereafter be 100 and 10 from Lake City, Fla.

Jonesboro, Ga., closed.

Shawhan, Ky., closed.

Lincolnville, Me., re-opened.

Brady, Mich., changed to Vicksburg, Mich.

Chippewa, Mich., changed to Lake, Mich.

Leslie, Mich., closed.

The office at 128 Crawford's Quarry, Mich., is in Presque Isle Co.

Horseheads, N. Y., is now a W. U. office, and should be checked direct, square 83.

The P. O. address of Skaneateles Junction, N. Y., is Hartlot, Onondaga Co.

Houston, O., closed.

Siverleyville, Pa., closed.

Stand-off City, Pa., closed.

Birdsboro, Pa., closed.

The office at Bingen, Pa., will hereafter be checked direct, square 59.

The P. O. address of Bethel, Tenn., is Bethel Springs, McNairy Co.

Stewart's Station, Tenn., closed.

Fortress Monroe, Va., closed. Business will be mailed from Norfolk, Va., check Norfolk.

Business for the Navy Yard, Portsmouth, Va., should be sent and checked to Portsmouth, Va.

Oconomowoc, Wis., is now an other line office, tariff for other lines 35 and 2 from Chicago, Ill.

New York, March 10th, 1873.

TO ALL TRANSFER OFFICES.

Complaint has been made that Section 5 of Instructions to Managers is not fully complied with; that in many instances the address of the payee of money transfers is insufficient or entirely omitted, and that much unnecessary correspondence and consequent delay is thereby entailed.

Managers should give particular attention to this point and see that a proper address, or explanation of its omission as hereinafter directed, accompanies each transfer order.

In cases where the sender is unable to give the precise address of the payee, but expects him to call for the money at the paying office, without notice therefrom, the words "*will call*" should precede the name of the paying office and be counted as part of the message, for example:

Pay JOHN SMITH, will call, NEW YORK.

In cases where the transfer is sent in response to a message from the paying office, no address will be required, but the words "*asking transfer*" should precede the name of the paying office, and be counted as part of the message, for example:

Pay JOHN SMITH, asking transfer, NEW YORK.

GOLD TRANSFERS.

When a transfer is received, *payable in gold*, and the manager of the paying office has no coin on hand, he will purchase the amount required and credit himself with the premium paid for same, in his monthly account current under the heading of "Premium on Gold." When no gold can be obtained, the manager will tender its equivalent in currency to the payee, ascertaining same by reference to his transfer agent, who will advise him of the current rate of the day.

Transfer agents will report in their weekly statements, under the heading of "Premium on Gold" the amount expended or allowed by their offices for premiums on gold transfers.

GEO. H. MUMFORD,
Vice-President.

EXECUTIVE OFFICE,
NEW YORK, March 12th, 1873.

On and after March 24th, money order offices will be established at the following named points:

In D. H. Bates' District.—Catawissa, Pa.; Lewisburg, Pa.; Milton, Pa.; Muncy, Pa.

In R. C. Clowry's District.—Denison, Texas.

G. H. MUMFORD,
Vice-President.

EXECUTIVE ORDER No. 145.

NEW YORK, February 27th, 1873.

The complimentary franks of 1872 are hereby continued in force until the first day of April. After that date they will no longer be received, and no stamps, except those for this year, will be valid.

GEO. H. MUMFORD,
Vice-Pres't.

PROJECT FOR A NEW CABLE BETWEEN ENGLAND AND AMERICA.

The prospectus of the company which has organized to lay a cable from Plymouth, England, to Rye Beach, N. H., has been published in London. All the money necessary for carrying out the project has been secured, and contracts for the construction of the cable have been concluded. The company is forbidden by its articles of agreement from amalgamating with any like enterprise.

THE transfer books of the New York, Newfoundland and London Telegraph Company will be closed in this city on the 31st inst., and removed to London and reopened on April 15.

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

ACKNOWLEDGEMENT OF RECEIPTS FOR ASSESSMENTS 37 & 38 TO MARCH 11th.

The acknowledgement of receipt of any assessment is to be understood as an acknowledgement for all previous assessments.

David Blackham of New York, certificate 1062, died February 28th, of consumption. His death, with that of Robert N. Norton, of Ironton, O., will necessitate another double assessment, which will be made in due time.

The subscription to the JOURNAL OF THE TELEGRAPH is $1.00 per year. It is no longer furnished to members at a reduced rate.

Mr. Perry Hood, Vincennes, Ind., E. Sholes, Dubuque, Iowa, Wm. DeBree, Louisville, Ky., have been appointed agents.

BORN.

GLASS.—At McLeod, Ky., March 4, 1873, to Frank Mt. Hope Glass, agent and operator, McLeod, a daughter.

MARRIED.

BLOXHAM—FIELDS.—On Monday evening, March 3d, 1873, by Rev. M. R. Wilkinson, Richard J. Bloxham, Operator W. U. Telegraph Office, Baltimore, Md., to Miss Eliza J. Fields.

STONE—ROUNDS.—On Wednesday evening, February 5th, by the Rev. J. S. Barger, Mr. Harry N. Stone, Manager of the Great Western Telegraph Office, Bloomington, Ill., and Miss Emily Estelle Rounds, all of Bloomington, Ill.

AN EXTENSIVE TELEGRAPHIC AND ELECTRICAL MANUFACTORY.

Siemens & Halske have extensive works for the manufacture of electrical and telegraphic apparatus in Berlin, St. Petersburgh, London, Vienna, Dresden, and Tiflis. The Berlin establishment alone employs 550 workmen. During the first six months of 1872 the following amount of apparatus was turned out from the Berlin works: 700 electro magnetic dial instruments; 1,750 magneto dials; 12,060 Morse ink writing recorders; 12,497 bell signals for railroads, and 231 Hughes type printers. The firm now consists of the brothers Ernest, William and Charles Siemens. In October last they celebrated their twenty-fifth anniversary, and set apart the sum of £8,000 or nearly $40,000, as a pension fund for their workmen.

Additional Agents wtll be appointed as soon as practicable.

Applications for membership should be endorsed by the Agent through whom they are made.

Members in communicating with the Secretary will always state the Number of their Certificate.

A. S. BROWN, Treas.
D. R. DOWNER, Secy.

* A. Hunter is Agent for all of Canada.

AT the meeting of the Society of Telegraph Engineers, on the 13th ult., Mr. L. Clark read a communication from Mr. Willoughby Smith, the electrician of the Telegraph Construction and Maintenance Company, detailing a discovery he had made of the extreme sensibility of selenium to the influence of light during the passage of an electric current. If the bar of selenium placed in the dark have an electric current passed through it, and it be subjected to the influence of light, either daylight, or that of a lamp or candle, its power of conducting electricity is immediately doubled, and the effect ceases as soon as the light is withdrawn. Its effect is not at all diminished by the intervention of rock salt or colored glasses, and it is in no way due to the effect of heat. Mr. Clark pointed out the value this discovery would have in connection with photometric measurement.

ELECTROTYPING AND LIGHT.—The new magneto-electric machine, devised by Mons. Gramme, consists briefly of a circular electro-magnet, with poles consecutively turned before the magnetic poles of a magnet, and the currents collected in a plane perpendicular to the poles. Without entering into any more extended explanation of the invention than that already published, as above indicated, we have now to note the results obtained in electrotypy, and the production of light through the agency of this machine. M. Gramme states, in *Les Mondes*, that at a rapidity of 275 turns, the instrument caused 8,101 grains of silver to be deposited in one hour, at 300 turns, 9,317 grains, and at 325 turns. 10,295 grains in a similar period. This last speed was too great, producing a heating of the coils which, if it had been continued, would have injured the machine.

A much larger apparatus was used for the production of light. Its height was four feet, and its weight about one ton. The wire rolled on the electro-magnets weighed 667 pounds, and that of the three coils used, 195 pounds. With 300 revolutions per minute, expending about four horse power, M. Gramme obtained a light equal to that of 900 carcel burners—a more immense artificial illumination than has ever heretofore been produced by electro-magnetic agency. The calorific effects, at the same speed of 300 turns, were remarkable. A wire of 28 lines, and one of iron of 52 lines in thickness, both 39 feet in length, were made red hot. The same iron wire, in a length of eight feet, was completely melted.

SYMPATHY BETWEEN TELEGRAPHERS.

To the Editor of the Journal of the Telegraph:

It is a rare qualification to keep silent when one has nothing to say, and not being prepared with any thoughts on telegraphing, I had concluded to trouble you with no more letters; but being a woman, must, after the fashion of my sex, indulge in the luxury of a few words, after having finished, just by way of postscript.

A characteristic, which all who have mingled with operators probably have noticed, is the strong bond of fellowship which unites them. Meeting under whatever circumstances, the hand is extended and warmly grasped, and no other introduction needed, except familiarity with the key; and although a curt demeanor may be sometimes manifested over the wires, there is an undercurrent of kindness which, if rightly appealed to, is seldom found wanting; and a very decided feeling, that quarrel as they may among themselves, "oprs." will stand up for each other against the world. If this sense of fraternity was entire, extending from the highest officer to each little messenger, its strength-giving influence to employees and profit to the company would be incalculable. But is not the feeling "*we*, the operators, and *they*, the company, almost universal"? Whether it is "*we*, the company, and *they*, the operators," my experience is too limited to say.

There is doubtless some excuse, when the idea creeps into the mind of an humble worker for a small salary, that there can be little in common between himself and a corporation owning millions, and, perhaps, the representatives of this powerful organization sometimes forget how much their prosperity and honor depend upon the combined integrity of a whole army of unknown individuals; nor can this want of sympathy, as far as it exists, be easily avoided, there being little opportunity for personal intercourse between officers and employees.

If we all, high and low, honestly did our duty, not from self-love, but for the good of the whole, how much better would body and soul be clothed and nourished, and how much surer attained the heights of preferment and ambition. In this age of the reign of dollars and cents, such a state of things is impossible, but even the contemplation of a higher life strengthens the heart to renewed effort.

It is well to remember, that we are the mediums for one of the noblest uses that science ever whispered into the ear of man. Each little office is a link in the electric chain which winds its sparkling length around the world, bids defiance to time and space, and draws the human family into closer bonds of unity.

Flashing warnings of quick coming danger, bearing messages of hope and comfort, of joy and calamity, birth and death, we are indeed the artery through which beats the great pulse of humanity. God has shorn the lightning of its terror and laid it harmless in our hands; let us receive the trust as coming from Him alone, and try to be faithful.

A.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, MARCH 15, 1873.

IGNORANCE OF THE REGULATIONS.

In many offices there appears to be much ignorance with regard to the manner in which the business of the company should be treated. In utter disregard of the regulations which govern the service, individual ideas of propriety are sought to be impressed in an arbitrary manner, often occasioning unseemly squabbles over the line, frequently causing delay in the transmission of messages, and in other ways proving detrimental to the Company's interest. It matters not who might be in the right in these contentions, the result is invariable—injury in some manner to the Company.

It would be well for managers of offices, if no better plan suggests, to copy out the rules applicable to each department of the service and affix them to the desks or tables of employés so that the proper course to be taken in conducting the business under their immediate charge would be clear and unmistakable. This, or some similar plan, would go far to lessen the evils complained of.

CONTEMPLATED REDUCTION OF RATES.

The Western Union Telegraph Company have under consideration, and the plans nearly matured, for a further reduction of tariffs, which is to be of the most radical and sweeping nature. The change contemplates the use of only ten different rates for the entire country, and will establish a uniform air-line distance rate between all offices in each of the divisions.

With their splendid system of lines, and improved apparatus for the transmission of messages, this Company is fully prepared to handle and expeditiously perform the increased business which it is believed will arise from these concessions. It is only in view of such increase that the contemplated reduction in rates can be justified.

The article upon the Duplex Telegraph, which appeared as an editorial in our last issue, was taken from an unpublished report of President Orton to the stockholders of the Western Union Telegraph Company.

PREPAID ANSWERS.

Among the items of correspondence in the JOURNAL of March 1st, are two enquiries relating to difficulties which had occurred under the operation of Rule 12.

The questions upon which we rendered decision in our replies are new, and relate to matters of much importance to the Company's service. We were correct in the main, as to the proper course to be taken in these individual cases, but we should have gone farther and have so framed our replies as to cause them to be applicable to the whole line.

Rule 12 reads as follows:

"Transient persons sending messages which require answers must deposit in advance an amount sufficient to pay for a reply of ten words. In such cases the signal "33" will be sent with the message, signifying that the answer is prepaid."

With regard to the first case, which represented that an answer of ten words was prepaid, and that the answer when received contained twenty-eight words, eighteen of which the party refused to pay for, the office from which the answer was sent acted wrongly in allowing a greater number of words than ten to be sent upon the check given.

In all cases of this nature the receiver should notify the party offering a message containing a greater number than ten words, as a prepaid answer, that such excess was beyond the limit and must be prepaid, or a sufficient guarantee be given to secure the Company from loss.

The second enquiry refers to the length of time that the amount deposited for a prepaid answer should be retained in the event of an answer not being received within what may be deemed a reasonable time, the proper reply would be as follows: and this will hereafter govern the service.

Answer.—Where parties have deposited money for an answer and none is received within a reasonable time, send a despatch to the office to which the original message was addressed, stating that the party who has deposited the money for an answer demands the amount returned, and that, unless the answer is received within a specified time, it will be returned, and that your office will not be responsible for the tolls upon the answer after such a time. But the money deposited must not be returned until it is certain beyond a doubt that the office from which the answer is due understands that the prepayment is withdrawn.

COUNTING ARBITRARY COMBINATIONS OF LETTERS.

It seems to have been a custom for some time past for receivers, in counting messages, to regard and pass such terms as "smorning," "safternoon" and "sevening," meaning "this morning," "this afternoon," "this evening," as one word. There is no warrant for this custom; on the contrary, it is a violation of the regulations. In Webster's Dictionary, the standard adopted by the Company, these terms are not to be found as words; therefore, they must be treated as a cipher which is composed of an arbitrary combination of letters. Rule 9 provides that

"Cipher messages, composed of simple English words in ordinary use, will be transmitted at usual tariff rates." All other messages in cipher, whether composed wholly or in part of figures, or arbitrary combinations of letters or words of any foreign language, when used as a cipher, will be estimated by counting each letter or figure as a word, and charged for accordingly."

HOW SHALL THE ALPHABET BE CHANGED.

The question of the desirability of changing the characters of the Morse alphabet, so as to avoid the elements of weakness contained in the spaced letters, is again being agitated. Spasmodic attempts to effect this improvement have from time to time, during past years, been made; but owing, probably, to the fact that these endeavors were wholly of an individual nature, nothing was effected. It is to be hoped that the present effort will result in a different manner.

The fact is well known to telegraphers, that by far the greater proportion of the errors which occur in the transmission of messages is attributable to the spaced letters of our alphabet, and, upon consideration, it doubtless will occur to them, as it has to us, that such being the fact, other characters should be substituted for those so objectionable.

If we assume it to be granted that there is good reason for a change, it will be proper to consider what shall be substituted in place of the letters to be discarded. We know of nothing better than those employed in Europe, and in fact in every part of the world but America, and when we accept these substitutions, our alphabet, with one or two exceptions, will be substantially the same as that in use in every other country.

From this point it is but a step for us to adopt the whole European alphabet. By so doing we should fill the only gap now open, and the language of the telegraph would become universal. There is no doubt that eventually the spaced letters will be abolished, and the sooner the better, for the welfare both of the companies and their employes. It is not to be supposed that telegraph companies will much longer continue satisfied to pay for errors which arise from an inherent weakness, and which can so easily be remedied.

We are convinced that the officers of the Western Union Company regard with favor the substitution of the European alphabet for our own, and only hesitate to give the necessary order to effect the change, from a feeling that their operators are not yet ready. Let us prepare, and by adopting this improvement as our own, show our employers that we regard their interests as identical with, and inseparable from those of their employes. Proof will thus be manifest that the wisdom of the telegraphers of America is only equalled by their skill, which, taken as a class, is not even nearly approached by any similar body in the world.

EXECUTIVE ORDER No. 145, in relation to stamps and complimentary franks of 1872, and also an Order of general instructions to Transfer Offices, appears on page 118.

PLAYING WITH THE TELEGRAPH.

Don Piatt, writing to the New York *Herald* about the Inauguration Ball, makes the following hit at the Post-Master General:

"Mr. Creswell, observing the telegraphic arrangements made to regulate the bands and various committees, begged permission to run the same for a little while. Of course this favor was granted him, but he created such confusion that it came near abruptly ending the festivities. He had all the bands going at once, and while one was playing the 'Dead March in Saul,' another was playing the devil with 'Yankee Doodle.' This does not speak much for Government telegraphy."

Is it not rather rough in the "home organ" of Mr. Creswell to speak thus disparagingly of the results of his first attempt to manage the telegraph. But just consider what the result would have been if, instead of handling the bands by telegraph, he had communicated with them by mail.

At last we have an electrical and telegraphic ghost. Its operations, fortunately, are thus far confined to one room, and to the instruments and wire contained therein, but there appears to be no certainty that its manipulations can be limited to that small compass of space. Let us, however, hope that the shade of this departed telegrapher will not seek to enlarge its sphere, but will remain content in the field in which it apparently holds undisputed sway; but we should breathe more freely if it could be removed from temptation. Perhaps those of our modern apparitions, which amuse themselves by throwing rocks, breaking dishes, and other innocent recreations, need a reinforcement; they have been very quiet of late. If, however, it must be telegraphing, will not some one in the confidence of this wraith, acquaint it with the prospectus of Prof. Loomis' aerial telegraph scheme. The opportunity thus afforded, to aid in perfecting a project so well calculated to advance scientific knowledge and human welfare, would command at once the gratitude of any well-disposed ghost, as also that of the endangered telegraph companies; and last, but not least, that of the professor himself, who, without such assistance, may, possibly, fail to find and utilize his electric strata.

The scene is laid at Dubuque, Iowa, and the story is thus told by the New York *Tribune*:—

A young man, intending to go into the business of telegraphing, purchased a pair of repeating instruments, with batteries and other apparatus, which he set up with a connecting wire in his room. To his great astonishment the instruments began to work of their own accord, "with a systematic and rythmic cadence about the clicks of the armature, analagous to those heard in the ordinary telegraph office." The ghost operated very quickly, but being requested to be a little slower in its communications, it kindly complied; and it was found that the clicks spelled "Edward Keats, of Baltimore." For many succeeding days the instruments have continued to work without contact. A printing machine was procured, and the ghost announced in Roman letters that he was "Edward Keats, of Baltimore, an operator on the National line." He has since telegraphed a number of "communications which cannot with propriety be given to the public;" and it turns out that he is assisted by a female shade named "Ettie Baker, late daughter of Judge Baker of Geneva, Ill."

We are living in an extraordinary time. The ghosts that squeaked and gibbered in the Roman streets were nothing to these modern wonders. The fact is, there are more things in heaven and earth than are dreamed of in our philosophy. Bless the memory of Shakespeare, for transmitting to us this easy solution of every possible mystery.

ONE OF THE ATLANTIC CABLES BROKEN.

After nearly two years of uninterrupted operation of both the Atlantic cables of the Anglo-American Telegraph Company, the 1865 cable failed at twenty minutes past twelve o'clock P. M. on Tuesday last. The tests at Heart's Content show that the fault this time is on the other side, probably not far from the Irish coast.

The 1866 cable and the French Atlantic cable are both in excellent condition, and will be able to satisfactorily and promptly transmit all the business offering. Probably the only unfavorable result of the interruption will be the expense to the company of picking up and repairing the cable, and this they can well afford to do, being in a very prosperous condition, The new cable which is to be laid this season by the French Atlantic Company is rapidly approaching completion, and within a few weeks New York will be in direct cable communication with Great Britain.

APACHE TELEGRAPH.

The Apaches have a very simple and yet effective system of telegraphy, which has unquestionably been in vogue from time immemorial. Lookouts are stationed on every prominent peak, within the range of one another's vision, commanding a complete view of the entire country. No human being can enter the region under surveillance unnoticed. Anything happening necessary to communicate to his fellow-watchmen, the lookout at once ignites a pitch-pine brand, which he moves in a manner intelligible to his confederate on the adjacent eminence, each movement having a significance familiar to them. This is repeated with lightning rapidity from mountain top to mountain top, until it reaches the chief in his fastness. Instructions are conveyed to his scouts in a like manner. Mr. Wm. E. Smith, manager of the Western Union Telegraph office in this city, has a magnificent chromo, illustrating this Apache telegraph. The original painting from which it was copied was taken from life, the scene being on the highland on the banks of the Gila River, the waters of which are to be seen meandering in the distance.—*Daily San Diego* (Cal.) *Union*.

THE FOLLY OF BAD PENMANSHIP.

The folly of bad writing is never better exemplified than in a telegraph office. A man rushes in, throws down a message, scrawled and blurred. It is important that that message should be sent instantly; at least ten thousand dollars are depending upon a speedy answer. The operator seizes it, and whisks away to call "Philadelphia." In less than a minute he is sending the message—in three seconds he is "stuck," and he cannot for the life of him make out the next word. Forthwith the messenger boy is sent to the office of the sender (a half-dozen blocks away) to find out what the obscure word is. The sender is not in—his clerk does not know what the word should be, it being a cipher message. Twenty minutes' fruitless search in the Stock Board, Gold Room, and other places where merchants and brokers "most do congregate," brings the messenger back to the telegraph office, just as the sender comes in for his answer, only to be told that his message has not been sent yet. No one is to blame but himself, and his well-known habits indicate that the adoption of the proverb, "the more haste the less speed," will be but transient.

ELECTION OF PRESIDENT AND DIRECTORS OF THE SOUTHERN AND ATLANTIC TELEGRAPH COMPANY.

On Monday, March 10th, the annual meeting of the Southern and Atlantic Telegraph Company was held at the office of the company, No. 51 New street, in this city.

It was announced to the meeting that the full amount of subscriptions to the stock of the company had been obtained, and that the company had no more stock to place. The company will now proceed to complete the extension of its lines to New Orleans.

Mr. James R. Crenshaw was reëlected President, and a Board of thirty Directors for the ensuing year.

A meeting of the new Board of Directors will be held at the above office on Monday, March 24th, to elect other officers, and complete the organization of the company for the ensuing year.

RUMORED PURCHASE OF THE FRANKLIN COMPANY.

For some days past statements have been current in telegraphic circles to the effect that the Franklin Telegraph Company has been purchased by the Atlantic and Pacific Telegraph Company, and will be managed in the same interest. Inquiry as to the truth of the matter elicited the statements that negotiations had been pending between the two companies for considerable time, and that the purchase had been consummated on Saturday by the payment of $37 per share for a controlling number of shares in the Franklin Company. Application was made to the Secretary of the Atlantic and Pacific Company for information on the subject, but he would not impart any, stating that while he knew all that was occurring in relation to the purchase, he did not feel at liberty to tell the news at this time. E. D. L. Sweet, the general manager of the line, was next visited, but he also declined to give any information. Not one of the executive officials of the Franklin Company was to be seen, as they were all in Boston.

William Orton, President of the Western Union Telegraph Company, was visited with more satisfactory results. Mr. Orton said that he, too, had heard the statement that a controlling interest in the stock of the Franklin Company had been purchased on Saturday, at 35, by the Atlantic and Pacific Telegraph Company. Still more recently, however, he had heard that the Franklin Company had been bought by individuals, probably indirectly in the interest of the Atlantic and Pacific, and he had derived the impression that there was an attempt making to put the outside companies, or the lines competing with the Western Union, under one management. The details Mr. Orton could not supply.

Subsequent inquiries confirmed Mr. Orton's belief that a combination was organizing among the lines competing with the Western Union. The lines supposed to be embraced in the new organization are the Atlantic and Pacific, office No. 33 Broadway; the Pacific and Atlantic, office No. 14 Broad street; the Southern and Atlantic Telegraph, office No. 51 New street, and the Franklin Telegraph, No. 11 Broad street.—*N. Y. Tribune*, March 14th.

COMPLETION OF A NEW LINE.

The Western Union Telegraph Company have completed and put into operation an entirely new line, extending from St. Louis, Mo., to Galveston, Texas.

Mr. Sprague Cheeney, of the Kalamazoo, Mich., Western Union Office, has been appointed Train Dispatcher for the Detroit and Milwaukee Railroad.

Mr. Waldo H. Collins has been appointed inspector Gold and Stock Telegraph Company, at office 61 Broadway, New York.

ON THE ALLEGHENY SYSTEM OF ELECTRIC TIME SIGNALS.

BY PROF. S. P. LANGLEY.

The necessity of a uniform standard of time for the railways of the United States is one which is growing into importance with the increasing extent of our railway system; and we are, ere long, in this country, to be called on to settle for ourselves a practical problem which has already been solved in England, and which is beginning to make its demand for solution upon the managers of our railroads.

Since past experience shows that their probable adoption of a new and common standard will introduce it to public notice and discussion, and then to adoption by cities and individuals, it is desirable that this should not be done without the direction which intelligent scientific co-operation will give to a movement originated by the demands of intercontinental traffic As few are aware how generally this co-operation has already been invoked, nor to what extent the public is indebted to observatories for increased security of transit, it has seemed that an account of what has been done in this direction in any one of them would be of interest.

The subject was first specially considered at the Allegheny Observatory some three years since, and a plan was arranged for the managers of the Pennsylvania Railroad in 1869. Previously to this, however, at the request of some jewelers of Pittsburg, the time had been transmitted to their stores, at a distance of some miles from the observatory. The system now described has been in use for nearly three years, in furnishing the Pennsylvania Central Railroad with its official standard of time; and by it the time is now sent daily to Philadelphia on the east, as far as Lake Erie on the north. and to Chicago on the west, regulating the clocks on a number of minor roads over whose wires it goes, as well as on those of the principal Southern lines connecting the Atlantic with the Mississippi. Thus passing, as it does, over several thousand miles daily, it is believed to be at present one of the most extended systems of time distribution in the world.

The observatory is on the summit of the ascent on the northern side of the valley of the Ohio, about two miles in a direct line from the offices of the Western Union Telegraph Company in Pittsburg, and rather more from those of the Pennsylvania Central, and Pittsburg, Fort Wayne, and Chicago roads. It is connected with these points by three independent lines of telegraph. One of these runs to the Western Union offices, and thence to the stores of a considerable number of jewelers in Pittsburg. This is called the "jewelers' line." The second, connecting the observatory through the offices mentioned with Eastern Pennsylvania and New Jersey Railways, and also with Chicago, is known as the "Railroad line." The third, consisting of a double wire or "loop," communicating with the city, is employed occasionally for the observatory's own messages, and when (as, for instance, in longitude determinations) it is wished to send sidereal time, without interrupting the regular transmission of signals from the mean-time clock. In the transit room, in the western wing of the observatory, are kept the sidereal clock by Frodsham, of London, and the principal mean-time clock, by Howard, of Boston.

On the escape-wheel arbor of this, the standard mean-time clock, and turning with it, once a minute, is a wheel cut with sixty sharp radial teeth, of which those corresponding to the 50th, 51st, 52d, 53d, 54th and 59th seconds of the minute have been removed by a file. Near the clock is a "repeater," the circuit through whose coils passes through a local battery, through a second clock in the computing room, and then through the standard clock. Each wire terminates in a delicate spring, close by the wheel just mentioned. While the extremities of these springs, which are shod with gold and platinum, rest in contact, the circuit is unbroken; it is opened by the minutest lifting of one from the other, and this is effected automatically by means of a ruby attached to one of them, and placed within reach of the wheel above mentioned. As each of these teeth passes, the ruby, and with it the spring, is lifted through a minute distance. (Not in practice more than one one-hundreth of an inch, and usually much less.) Once a second, therefore, the circuit is opened during a period of probably less than a twentieth of a second, and as the wheel advances a tooth with each vibration of the pendulum, the armature of the repeater is raised each second of the minute, until the 49th is completed.

Since the teeth corresponding to the next five seconds have been filed away, during those seconds the jewel is not touched nor the circuit opened. The consequent silence of the "repeater's" beats draws attention to the fact that the end of the minute is approaching, its completion being indicated by the short pause caused by the absence of a tooth at the 59th second.

This action is repeated in every minute of the twenty-four hours, without variation. The particular second is thus identified, but one minute is (so far as the action of the standard clock is concerned) not distinguished from another. To do this is the work of the subsidiary clock in the computing room, through which the local wires are led, as has been mentioned. This subsidiary clock (made by Howard, of Boston) may be called, for distinction, the "journeyman," and its principal office is not to give the time, but to interrupt the circuit, which it does on or near the completion of the 58th minute, closing it again about half a minute before the completion of the hour. When the circuit is opened by the journeyman, the repeater is silent for a minute and a half; when it is closed, the standard is again heard ticking on the repeater, and the ensuing short pause evidently precedes the first second of the first minute of the hour. The time is thus wholly derived from the standard clock, and is independent of any other, the journeyman having no power to control or in any way react upon the primary, and being able only to interrupt the message it sends, not to falsify them.

The mechanism for effecting the transmission of the time is essentially that already described, but more is needed to ensure against possible interruption. This may occur from several causes, prominently from oxidation of the platinum or gold contact surfaces; when the current must be interrupted while they are cleaned, if there be no other clock. To meet this contingency a chronometer, of peculiar construction, was made for the observatory by Frodsham. It resembles the ordinary marine chronometer in external appearance, but contains in miniature the apparatus for breaking circuit already described, the wheels being cut so as to give the same signal of the approaching end of the minute as the standard clock. The peculiarity consists less in this, however, than in a device by means of which it can be caused to gain or lose any fractional part of a second, or any number of seconds, without being stopped, and without any disturbance of its normal rate, except while the change is being effected. This chronometer is to replace the prime clock in the circuit, during any temporary stoppage of the latter for repair or adjustment.

The mechanism which has just been described acts in connection with the local circuits of the observatory; one battery being employed for the sidereal clock and chronograph, and another for the mean-time standard. Any interruption of the main external circuits is shown at once, by the action of a galvanometer in each, which makes an audible and visible signal when the circuit is opened. The accessory apparatus, such as batteries, relays, switchboards, and so forth, which are used in every telegraph office, it will be superfluous to describe here in detail, but before following the operation of the electric current, outside the observatory, it will be well to speak of the method which has been adopted as likely to ensure most accuracy in the time-keepers which control it.

The transit instrument in the western wing is of four inches aperture, and with it and the chronograph, observations for time are made on every fair night of the year, except on Sunday, when, if complete determinations have been made on the preceding night, none are taken. The instrument is of sufficient power to follow the principal Nautical Almanic stars in the day, and these are used (or more rarely the sun), when the weather permits, if the usual night observations have been missed. From three to six stars are customarily taken, the azimuthal error of the instrument being found from the observations of each night, after the other corrections are applied, and the results determined from the chronograph and the sidereal clock. The mean error in the resulting determination of the sidereal clock correction, is from three to four hundreths of a second; but it cannot be assumed that that of the mean time standard is known within these limits, except at the time that the observations are freshly made.

It may be desirable to point out where the system pursued here differs from that in which a few signals are sent at stated hours, as at Greenwich. In the case of the time ball, for instance, dropped daily by a clock at Greenwich mean noon, it is customary to compare the mean time clock which drops it, with the sidereal time a few minutes before twelve. If it (the operating clock), be slow, it is caused to gain, and if fast, caused to lose, an amount needed to bring it to coincidence before the automatic action gives the signal

The time of this signal is nominally exact, but in fact involves the variations in rate of the standard clock or clocks, which are treated in the comparison as having their errors absolutely known. It is by no means meant to criticise this procedure, but to point out that, as error must exist where the rates of the clocks are treated as constant in the intervals between observation, no less real accuracy is reached in the method employed here, in which (as the signals are being constantly sent) the signalling clock has no less nominal error at noon (for instance) than at any other hour.

When the sidereal clock has entered its beats upon the chronograph during the time of observation, the record is not interrupted until the mean time standard having been put into the same circuit, both clocks have automatically entered their time on the sheet together, and the break circuit chronometer has done so also. The sheet being removed, and the breaks of the transit observer measured, the comparison of the various clocks with electric attachments are taken by measurement on the same sheet, and the others compared with the sidereal clock by noting coincidence of beats by ear. The resulting errors of all are then determined, reduced to a common epoch and entered in a permanent record kept for the purpose.

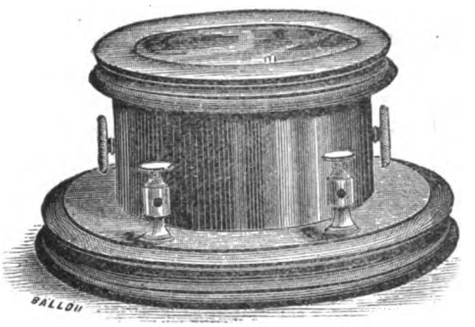
Those who are aware of the number of patented devices for controlling distant clocks by electricity, may perhaps feel surprise that so little mention has here been made of their use.

Some of these are of extreme ingenuity and much promise, and the English patents covering such points are alone to be reckoned by scores. Plans have been submitted to the writer by which the clocks along any number of miles of road could be set right, and brought to uniform time in a few seconds by the operator at the observatory, and these plans appear feasible. The arrangements adopted here, as the reader will observe, do not greatly differ from those employed in telegraphic determinations of longitude, and in fact a prolonged examination of very many ingenious devices for directly controling distant clocks led the writer to set them all aside, and to employ methods not differing in principle from those in use already, for purely scientific ends, in most American observatories.

The necessity of a uniform standard of time over the whole country, which was alluded to in the outset as one of growing importance, has not been further directly touched upon in this article, which is yet, as a whole, devoted to describing the means of meeting it. The evident tendency, in thus sending the time from one standard over so large an extent of territory, is to diminish the number of local times, and so prepare the way for a future system, in which, at least between the Atlantic and the Mississippi, they shall disappear altogether.

What point shall be chosen is of less importance than that some *one* shall be used and universally.

The subject is one which has hitherto attracted little public attention, but it does not seem unsafe to make the assertion, that the causes which have almost insensibly effected such a revolution in England, will in a few years more bring it about here.



WHO INVENTED THE ELECTRICAL BALANCE?

The invention of the electrical balance—the most beautiful and perfect apparatus known for accurate electrical measurements—has been commonly attributed to Professor Chas. Wheatstone, and, in fact, is almost universally known among electricians as the "Wheatstone bridge." In reality the apparatus was not invented by Wheatstone, but by Mr. S. Hunter Christie, of the Royal Military Academy, Woolwich, England. Mr. Christie read a paper upon his invention before the Royal Society in 1833, ten years before Professor Wheatstone brought it for the second time to the notice of the public, in his remarkable paper upon electrical measurement in 1843, in which he stated the source from which the invention was derived, and gave the dates of the papers which Christie had written upon the subject. It was therefore, not the fault of Wheatstone that his name became attached to the arrangement. The value of the bridge was vastly increased by the improvement effected by Mr. Werner Siemens. The first attempt to use the instrument for testing coils of insulated line wire was made by Dr. Siemens in 1847-48. It was soon found that the range of the instrument was insufficient, and it occurred to him to construct the resistance boxes so as to make the two arms of the balance variable, which gave a much larger range of reading, and this arrangement is now in univeral use among electricians. The excellent arrangement of resistance boxes with metallic plugs, for cutting out or short-circuiting the coils, is also due to Dr. Siemens, and has added much to the convenience and reliability of electrical measuring apparatus.

Manufacturer and Dealer in

TELEGRAPH SUPPLIES.

THE LITTLE MONITOR RELAY

Is a substantially made and good working Instrument, incased in a polished Rubber Cylinder with Plate Glass Cover, has back and front Adjustment.

EVERY INSTRUMENT WARRANTED.

Price, $10.00.

Also, LITTLE MONITOR SOUNDER, to match,
Price, $6.00.

And Small Size W. U. KEY,
Price, $4.00.

All kinds of Learner's Instruments, with Instructions, constantly on hand. Send for Circular.

M. A. BUELL,
26 WARING BLOCK,
CLEVELAND, O.

THE
LECLANCHÉ BATTERY CO.

Is now prepared to supply promptly the increasing demand for

This Celebrated Battery,

(SECURED BY LETTERS PATENT IN THIS COUNTRY)

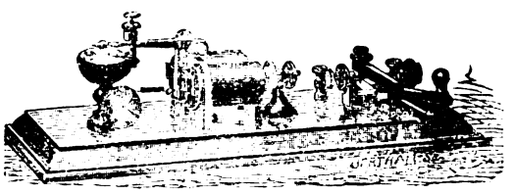
and which is extensively used throughout Europe for

TELEGRAPHY,
RAILROAD SIGNALS,
HOTEL ANNUNCIATORS,
BELLS, ETC.

Among the numerous advantages of this Battery may be mentioned—

ENTIRE ABSENCE OF ACIDS,
ITS GREAT CLEANLINESS,
WONDERFUL DURABILITY,
GREAT ECONOMY IN RUNNING EXPENSES.

This Battery will last, without any Attention, from six months to a year.

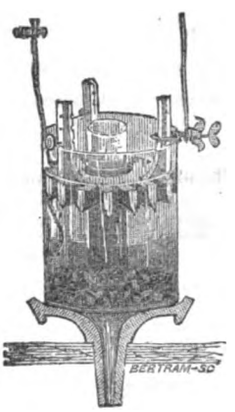


A number of cups have been in use by the Western Union Telegraph Company, *on a closed circuit*, since Nov. 26, 1872, nothing but water having been added since they were first set up.

For further particulars apply to

THE LECLANCHÉ BATTERY CO.,
No. 40 West 18th St., N. Y.,
OR
L. G. TILLOTSON & CO.,
SOLE AGENTS,
No. 8 Dey Street, New York.

WATTS & COMPANY,
Baltimore,
MANUFACTURERS OF
Electrical and Telegraph Instruments
AND
MATERIAL OF EVERY DESCRIPTION,
RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc.
Nickel Plated Goods a Specialty.



A VERY SUPERIOR MAIN LINE SOUNDER.

ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

SOLE MANUFACTURERS OF THE
NEW PATENT BALTIMORE BATTERY,
MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7½ inches,
Specially adapted to Railroad Signals, Printing Instruments, etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country, having proven the cheapest, and least trouble to maintain, of any in the market.

Patented Dec. 31, 1872.

ALSO, SOLE MANUFACTURERS OF THE
Patent Circuit Closer Key,
O'Sullivan Self-closing Key,
Scott's Patent Hotel Annunciator,
by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE
PATENT BATTERY INSULATOR
shown, holding a cup of the Baltimore Battery in the above cut which most effectually insulates the Battery as the drip passes off *through a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. PRESCOTT, says of it:—"I think your Battery Insulator is very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.
Repairers' Tools constantly on hand.
Importers and Dealers in best English and American Galvanized Wire.
MANIFOLD PAPER, for Train Orders, etc. Also, AGATE PENS.
In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices.

WASHINGTON TELEGRAPH AGENCY,

For the transaction of all business pertaining to

Telegraph and Electrical Matters,

and for the sale of

TELEGRAPH SUPPLIES

OF EVERY DESCRIPTION.

Special attention given to the exami t on of

PATENT CASES

and the collection of

GOVERNMENT ACCOUNTS.

TELEGRAPHERS' EMPLOYMENT BUREAU,

TOLEDO, OHIO.

—o—

A Telegraphers' Employment Bureau has been established in this city, under the direction of several well known Telegraph Superintendents, having for its object the reception of applications for positions as operators, or operators and clerks or agents combined.

Applicants must state:

1st—Age. How long in the service. Reason for changing position. Present Salary. Sound or paper reader. Able bodied or otherwise.

2d—Applicants must send recommendations from present employer, or if not at work, from former employer as to moral character and capabilities. Recommendations to state if applicant is capable of filling positions other than operator, such as ticket agent, freight clerk, or agent.

This list will be published monthly and forwarded to the Superintendents of Telegraph Lines and a copy sent to each applicant whose name is printed thereon. All names to be published two (2) months. All applications to be accompanied by a fee of two (2) dollars.

Address,

Telegraphers' Employment Bureau

TOLEDO, O.

THE

ELECTRIC RAILROAD SIGNAL CO.

SPECIAL NOTICE.

OFFICERS OF RAILROAD COMPANIES, and others interested, are notified that this Company is the sole owner of the ORIGINAL PATENT for operating

ELECTRIC SIGNALS

by including a section of a railroad track in the electric circuit which was issued to F. L. POPE, July 16, 1872. Railroad Companies are **CAUTIONED** against negotiating with unauthorized parties for the use of this Invention, as this Company will take legal measures to protect themselves against all **INFRINGEMENTS.**

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 9. NEW YORK, APRIL 1, 1873. WHOLE NO. 130.

EXPERIMENTS SHOWING THAT ELECTRICITY RESIDES UPON THE SURFACE.

Electricity (subject to the exceptions mentioned below) resides exclusively on the external surface of a conductor. This is perhaps implied in the experimental fact frequently observed by Columb, that when a solid and a hollow sphere of equal external diameter are allowed to touch each other, any charge possessed by either is divided equally between them. A direct demonstration is afforded by the following experiment of Biot:

We take an insulated sphere of metal, charge it with electricity, and cover it with two hemispheres furnished with insulating handles, which fit the sphere exactly (Fig 1). If the two hemispheres be quickly removed, and presented to an electric pendulum, they will be found to be electrified, while the sphere itself will show hardly any traces of electricity. We must, however, remark that this experiment is rarely successful, and that generally the sphere remains very sensibly electrified. The reason of this is, that it is very difficult to remove the hemispheres so steadily, as not to permit their edges to touch the sphere after the first separation.

The following is a much surer form of the experiment:

A hollow insulated sphere, with an orifice in the top, is charged with electricity (Fig. 2). A *proof-plane*, consisting of a small disc of gilt paper insulated by a thin handle of shellac, is then applied to the interior surface of the sphere, and, when tested by an electric pendulum or an electroscope, is found to exhibit no trace of electricity. But if, on the contrary, the disc be applied to the external surface of the sphere, it will be found to be electrified, and capable of attracting light bodies. Faraday varied this experiment, by substituting a cylinder of wire gauze for the sphere. This cylinder rested on an insulated disc of metal. The disc was charged with electricity, and it was found that no trace of the electricity could be detected by applying the proof-plane to the interior surface of the cylinder.

The following experiment is also due to Faraday. A metal ring is fixed upon an insulating stand. To this ring is attached a cone-shaped bag of fine linen, which is a conductor of electricity. A silk thread, attached to the apex of the cone, and extending both ways, enables the operator to turn the bag inside out as often as required, without discharging it. When the bag is electrified, the application of the proof-plane always shows that there is electricity on the outer but not on the inner surface. When the bag is turned inside out, the electricity therefore passes from one surface of the linen to the other.

There are two exceptions to the rule that electricity is confined to the external surface of a conductor.

1. It does not hold for electric currents. In connection with galvanic electricity, the resistance which a wire of given length opposes to the passage of electricity through it, depends not upon its circumference but upon its sectional area. A hollow wire will not conduct electricity so well as a solid wire of the same external diameter.

2. Electricity may be induced on the inner surface of a hollow conductor by the presence of an electrified body insulated from the conductor itself. If an insulated body charged with electricity be introduced into the interior of a hollow conductor, so as to be completely surrounded by it, but still insulated from it, it induces upon the inner surface a quantity

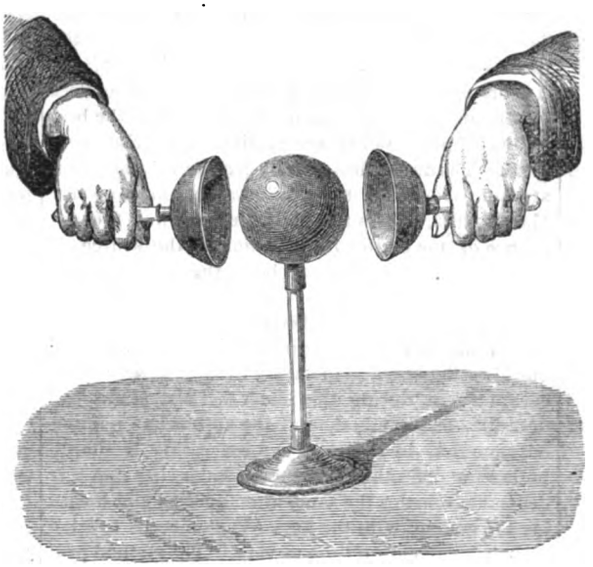

Fig. 1.

equal to its own charge, but of opposite sign. If the conductor is insulated, an equal quantity, but of the same sign as the charge of the inclosed body, is repelled to the outside, and this is true whether the conductor has an independent charge of its own or not. In this case, then, we have electricity residing on both the external and the internal surfaces of a hollow conductor, but it still resides only on the surfaces.

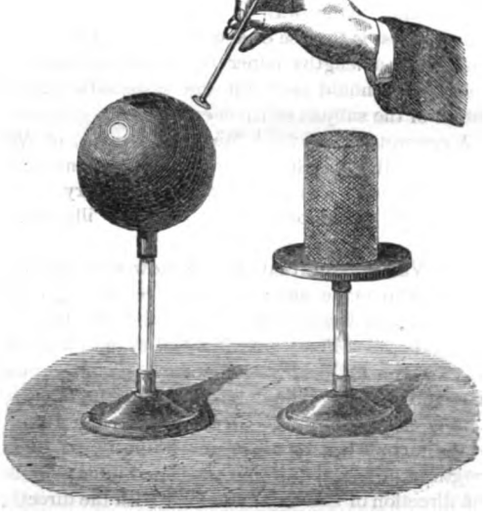

Fig. 2.

If a conducting body, connected with the earth, be introduced into the interior of a hollow charged conductor, so as to be partially surrounded by it, the body thus introduced will acquire an opposite charge by induction, and by the reciprocal action of this charge, electricity will be induced on the inner at the expense of the outer surface of the hollow conductor, just as in the preceding case.

The effect of introducing a charged body within a hollow conductor is well illustrated by the experiments of Faraday with insulated ice pails. These experiments, which are fully described in our article upon Static Induction, published in the JOURNAL of February 1st, 1873, prove that when a hollow conductor is electrified, however strongly, no effect is produced upon pith-balls, gold-leaves, or any other electroscopic apparatus in the interior, whether connected with the hollow conductor, or insulated from it, provided, in the latter case, that they have no communication with bodies external to the hollow conductor. Faraday constructed a cubical box, measuring 12 feet each way, covered externally with copper wire and tin-foil, and insulated from the earth. He charged this box very strongly by outside communication with a powerful electrical machine; but a gold-leaf electrometer within showed no effect. He says, "I went into the cube and lived in it, using lighted candles, electrometers, and all other tests of electrical states. I could not find the least influence upon them, or indication of anything particular given by them, though all the time the outside of the cube was powerfully charged, and large sparks and brushes were darting off from every part of its outer surface."

The fact that electricity resides only on the external surface of a conductor, combined with the fact that there is no electrical force in the space inclosed by this surface, affords a rigorous proof of the law of inverse squares. For if the conductor be a sphere removed from the influence of external bodies, its charge must be distributed uniformly over its surface. Now it admits of proof, and is well known to mathematicians, that a uniformal spherical shell exerts no attraction at any point of the interior space, if the law of attraction be that of inverse squares, and that the external attraction does not vanish for any other law.

When the proof-plane is applied to different parts of the surface of a conductor, the quantities of electricity which it carries off are not usually equal. But the electricity carried off by the proof-plane is simply the electricity which resided on the part of surface covered by it, for the proof-plane, during the

Digitized by Google

time of its contact, is virtually part of the surface of the conductor. We must therefore conclude that equal areas on different parts of the surface of a conductor have not equal amounts of electricity upon them. It is also found that if the charge of the conductor be varied, the electricity resident upon any specified portion of the surface is changed in the same ratio. The ratio of the quantities of electricity on two specified portions of the surface is in fact independent of the charge, and depends only on the form of the conductor. This is expressed by saying that *distribution* is independent of charge, and that the distribution of electricity on the surface of a conductor depends on its form.

EARTH CURRENTS.

An ordinary meeting was held on Wednesday evening, the 12th ult., of the Society of Telegraph Engineers, Latimer Clark, Esq., Vice-President, in the chair.

Three communications from Mr. Stout, of Lerrick, on "Earth Currents," was read by the Secretary. In the first paper the writer stated that he has often had the needle of his instrument vibrated by accidental or earth currents, and sometimes to such an extent that it was impossible to continue working, even with a single needle instrument. These currents seem to be the strongest when there is a considerable aurora, but sometimes there is a brilliant aurora and very little current or none at all. He had observed that upon a shower of snow coming on, the currents commenced, that they increased in intensity until the storm was thickest, that they lessened as the storm subsided, and disappeared when the shower ceased. This was more noticeable when the snow came in large fleecy flakes. Hail did not seem to have any effect on the currents. The two other communications stated the results of observations made on the occurrences of aurora and their relation to earth currents.

Mr. G. K. Winter, F. R. A. S., read a paper on "Earth Currents." The author stated that the electric telegraph had been but a short time in existence when it was found that occasionally very powerful currents from some unknown source showed themselves in the wires. Happily these disturbances were found to be neither of very frequent occurrence nor of long duration. Subsequently, however, as more delicate instruments were used, it was discovered that the wires were scarcely ever free from the currents, and though they were rarely strong enough to interfere seriously with speaking instruments, yet they considerably embarrassed testing operations. The author has, for many years, given these currents a good deal of attention, and, although his experiments are, as yet, very far from being complete, he thinks that some of the results already obtained are of some interest; and, as the methods he has adopted are in some respects novel, a few words on the subject might not be unacceptable. He commenced by assuming that the currents in the wires are due to large streams running through the earth, and that the strength of the current in any one wire is influenced by two circumstances—first, the strength of the earth stream, and, secondly, by the angle it makes with a line joining the two earth-plates. Of course the resistance of the circuit, and the distance between the two earth-plates, have their influence. Their effect may, however, be looked upon as practically a constant factor for any one wire. The variation of the current in any one wire must be attributed to variations in the circumstances above mentioned. The object of his experiments was to determine the two influences separately. By making simultaneous observations on two wires placed at right angles to each other the separation becomes very easy. The experiments were made near Madras. Two wires were erected, each two miles in length, and approximately of the same resistance, one running north and south, and the other east and west. The instrument used for measuring the current was a tangent galvanometer. Right and left deflections were taken, and the mean of the two was calculated. The currents of both wires were observed on the same instrument. The whole of the changes were made by a very simple series of switches. The observations occupied about one minute, and were reduced in a very simple way. The method adopted was simply an application of the principle of the parallelogram of forces. It is scarcely to be expected that the stream is uniform in its strength, direction, and variation in different parts of the world. The apparatus for the measurement of the two elements of the currents need not be of an expensive character. There are doubtless numbers of people in different parts of the world who are qualified to make observations. Of course it was necessary, for proper organization, that the matter should be taken up by some scientific body, and that definite directions for observations should be drawn up. The author believes the absolute magnetism of the earth to be much more constant than is imagined. A more practical bearing of the question is the effect of the derived currents on our tests, and the best means of eliminating errors likely to arise from them. The author has already treated this question at some length in the *Philosophical Magazine* for March, 1872. It is the variation and not the existence of the earth-current which is the source of the chief difficulty, for as both the electromotive force and resistances are unknown we require two observations to enable us to determine either; and it is difficult to make two observations so quickly one after the other as to ensure the constancy of the earth-current during the interval. Mr. Mance has described one method, and the author has pointed out another, in which one observation is simply noting the deflection, and the second seeing that this deflection remains the same after making and breaking the contact with the key. The object is to give the earth-current no time to vary. The method proposed by the author was described in his paper in the *Philosophical Magazine*, and is simply a modification of Mr. Varley's method of measnring a single cell by means of a differential galvanometer. The difficulty arising from the sudden flow through the galvanometer, is common, in a greater or less degree, to both Mance's method and that described by the author. One way in which he proposes to remedy this is the use of a condenser. The author concluded a lengthy paper by recommending that the Society should take up the systematic investigation of the subject of earth-currents.

A communication from Mr. J. M. Graves, of Valentia, detailing a series of minute observations on the same subject, was read by the Secretary. The paper was accompanied by various illustrative tables.

Mr. Varley said that Mr Barlow was the first person who made any systematic record of earth-currents. He began in 1846, with the assistance of one of the Vice-Presidents, Mr. Culley, and used the wires of the Midland Railway for his observations. A record of these would be found in the *Transactions of the Royal Society*. He found that the strength of the current was by no means proportional to the length of line in circuit, but depended upon whether the direction of that line coincided with the direction of the earth-current; that there were periods of maxima and minima; that there were always earth-currents on the line; and that these earth-currents were not disturbed by auroral currents, which were very erratic. In 1847 he (Mr. Varley) observed the first earth-current which it fell to his lot to see. It was on the occasion of a tremendous auroral display, in which the arch was distinctly visible above the horizon for several degrees, and all the lines in Great Britain were stopped for the time being. That was the first time that attention was strongly drawn to the subject, and the question was taken up by the Astronomer Royal, Mr. Airey. Mr. Walker and the Astronomer Royal had now been making observations by means of cross wires for more than twenty years, and had drawn out the true direction of the currents upon the principle of the parallelogram of force which Mr. Winter had described. It was well to observe that if experimenters used an earth-plate of limited size its resistance would vary a good deal, owing to the hygrometric condition of the earth varying, and other causes. If they attempted to get a very large earth-plate by connecting the wire with the gas-pipes, then they would get not only the current due to the wire itself, but also that which was due to the extensive system of pipes with which it was connected. In 1855 he observed, on a line of only two miles length, a current so strong that it stopped the working. The enormous strength of the current on so short a line led to some astonishment; but he thought that there was no doubt that the earth-current was not one that was the potential of the difference between the two lines of wire, but arose from the conductors afforded by the gas pipes. In 1847 he observed an earth-current between Dawlish and Teignmouth, a distance of three miles, and in endeavoring to measure its potential he found that twenty-four cells of a sand battery were insufficient to balance it. From 1852, onwards, he had kept very careful records at telegraph stations of all the earth-currents he could observe, and some very curious results had been obtained. First of all, he found that there were certain localities between which the currents were strongest, the strongest of all being between Ipswich and London. Ipswich might be considered as a sort of funnel-shaped indentation of the coast. Off King's Lynn there was a similar funnel, and this place was not far north of Ipswich, and yet the currents from the former place were very feeble. But farther north, from Newcastle for instance, they got the same earth-currents as were generally got from Ipswich, which was at the southward of King's Lynn. It was frequently found that, while the currents from Newcastle to London, and Ipswich to London, were positive, that from King's Lynn would be faintly negative. On drawing the neutral line, it became evident that that neutral line very nearly followed the line of the coast; and that was most likely due to the circumstance that arable land, as compared with sea water, was a very poor conductor, and consequently the currents observed on this particular land line were those brought by the sea, arrested in a great measure by the non-conducting land. If observations were made simply on such currents, it would not be right to infer that the general current of the year was all the strength indicated upon the line. It would be very much feebler, the concentration being due to the great currents of the whole earth being arrested by the less conducting land. This was borne out very strongly by the fact that the currents observed from Amsterdam to London, which were almost in the same line as Ipswich and London, but 130 miles farther apart, were but little stronger than the currents from Ipswich to London. He had frequently endeavored to measure the earth-currents on

Digitized by Google

short wires. In his garden he had a number, varying in length from 200 to 600 yards, and laid in different directions; but he found that the variations, due to the different states of moisture and other conditions, were so great that the earth currents could not be recorded with any certainty. In fact, he knew of nothing more difficult than to get two earth-plates, in different parts of the earth, neutral to the earth or of equal potential. In the first paper attention was drawn to the fact that the earth-currents varied very much with the snow. He was afraid that Mr. Stout had mistaken the cause of that variation. The changes had probably been due to the snow producing increased leakage between the wires and the earth, by connecting the wires with the poles, or possibly, with a wall. The rapid variation of the earth currents which Mr. Stout had observed he (Mr. Varley) thought must be due to some station endeavoring to call, and not to the earth tself, for he had never, on any one occasion, found an earth current to change from maximum positive to maximum negative in less than fifty seconds. More generally the change occupied several minutes, and once he saw a continuous current of twenty minutes duration. In November and December, 1867, he took a number of observations on the Rigi with reference to the existence of the so-called negative cloud. He did once observe a negative cloud of 400 cell power during a snow-storm, but the atmosphere above was negative for only an hour and a half, and it then resumed its normal positive condition. He mentioned this because it would be interesting to ascertain whether the formation of snow really influenced the electrical conditions of the atmosphere. The subject of earth-currents had caused him very serious doubts as to the existence of long cables. When the 1865 cable broke, after 1200 miles had been laid, a series of very powerful earth-currents showed themselves, and Mr. Graves, who was then at Valentia, stated that so great was their power that they produced a distinct arc across his key over a distance of one-tenth of an inch. He (Mr. Varley) could not assume that the power could have been less than 2,000 cells of Daniell's battery. He had frequently seen, between Ipswich and London, a difference of from 70 to 150 cells. When Admiral Fitzroy was establishing his signals, he (Mr. Varley) observed on two occasions that earth-currents were followed by a change of weather. This fact was communicated to the Admiral, and proved of so much value to him that for some time he had information of the earth-currents regularly supplied to him. It was often possible, by their means, to predict a coming storm before the barometer became affected. The subject of the difficulty in testing arising from earth-currents was a very important one. He and Sir Wm. Thomson had found, in testing the 1866 Atlantic cable, that one of their chief difficulties was to find a satisfactory method of eliminating the earth-currents. The method of testing adopted with the long cables made by the Telegraph Construction and Maintenance Company, since 1865, had been what was known as the slide resistance coil. In order to get the true reading, all they had to do was to take the slide reading first with the positive current, then to take the slide reading with the negative current; add the two together, and divide by two. The mean slide reading would be the correct one, and the earth-current would be eliminated. Mance's method of measuring resistance was a very pretty one, and was probably known to all present; but there was a very serious objection in its use. Every time they altered the resistance to get the true reading they altered their zero, and unless the coils were constructed specially for each case the amount of variation in the zero was very much greater than the amount of variation due to a very considerable error in the adjustment of the resistance coils; and the consequence was that, in measuring a long cable, each time they shifted the zero they must wait at least 15 seconds, for the cable to get balanced, before they could get another, and thus the observation was so protracted that practically they could not get a reading at all. As to the use of condensers, if Mr. Winter would refer to a paper published by him (Mr. Varley) in 1860, he would there find the whole thing delineated. There was, however, another way of applying Mance's method, and it was less liable to the objection of the zero shifting so tremendously. At St. Pierre, last year and the year before, when the cable was broken, Mr. Gott adopted the method of putting in a condenser, making an artificial line to facilitate the testing. That answered exceedingly well, and all that Mr. Winter had said about it had been borne out in practice. The Atlantic cable ran nearly east and west; and he very frequently found, on looking over the tests, which were made almost every morning, that, although St. Pierre and Brest were nearly of the same potential, there was almost always a current through the gutta-percha in that direction, or *vice versa*. That is to say, the middle of the ocean was positive or negative to the two ends, while the two ends were pretty nearly of the same potential. Mr. Willoughby Smith informed him that on one occasion he could distinctly trace a current coming through the gutta-perch, and running across between the 1865 cable and the 1866 cable. This was indicated by galvanometers at each end showing a similar current running in each direction. This confirmed what he (Mr. Varley) had repeatedly observed on the French Atlantic cable. He had very little doubt that the aurora was due to the discharge of electricity from the upper regions of the air to still higher regions; and the question arose, Whence came this electricity of the atmosphere? He thought it would be found to be due to the rotation of the earth. It was well known that when the atmosphere in a tube was reduced from the present pressure of about 30 inches of mercury down to the 100th part of an inch, it had a conductivity, roughly speaking, as 5,000 cells to 300, or say 200 to 1. To get such a reduction in the atmosphere, we must go up between 20 and 40 miles. The air at this height would not rotate so rapidly as the earth, and might therefore be considered as stationary to the earth. We had, therefore, a magnet rotating inside a fluid conductor. Faraday had shown, putting the earth in rotation as it is, in its present direction, we should have the two poles positive the equator. He (Mr. Varley) believed that that was the source of the electricity of the atmosphere, because it was invariably found that the wind coming from the north pole was strongly electro-positive to the earth, and the aurora borealis generally occurred when the northern wind was coming.

The Chairman said that they had had three very valuable communications. Mr. Stout, in his communication, made a suggestion which he (the Chairman) made himself in print some years ago, which was, that the varying earth-currents which were visible during an aurora might be caused by the induction of the flashes of auroral light as they appeared overhead, and many observations which he had given seemed to confirm that view. The same writer made a suggestion that snow-storms might have some effect in producing currents, as if the currents were derived from the air itself, and not from the earth. He (the Chairman) agreed with Mr. Varley in thinking that in that point Mr. Stout was mistaken. No doubt the wires perpetually received currents from the atmosphere, but they were currents of high tension and very feeble quantity, and did not produce any effect on such instruments as those which Mr. Stout had at his command. He thought that Mr. Stout's views on that point needed confirmation. Mr. Winter alluded to the force of the earth, and said that he believed that force to be much more constant than was generally supposed. He (the Chairman) believed that Mr. Winter was perfectly right, and that idea was one which he had long entertained. It was evident that the sun was exercising a very enormous power over the currents of the earth. They all know that there was a period of eleven years, during which the sun's spots increased and decreased, and during those periods aurora were more or less intense, and there was more or less rainfall at the maxima and minima of the spots. Generally, it was quite clear that much of our magnetic force depended upon the sun. About 1850 two observers were looking at the sun with their telescopes in different parts of the country, and they both observed at the same time, and independently, a body apparently flash into the sun, and cause a very visible disturbance of the sun's chromosphere. After that they communicated with each other, and discovered that it had been found at the same moment that all the magnets in the world were disturbed. At first sight it seemed curious that the disturbance of the magnets should be instantaneous with the appearance in the sun, but that wonder vanished in consequence of a recent observation of Prof. Balford Stewart, who found that the velocity of the transmission of magnetism happened to be the same as the velocity of the transmission of light. Mr. Graves, in his paper, had given some very interesting observations, amongst which he mentioned a connection between earthquakes and earth-currents. That view had been somewhat confirmed by Mr. Varley. It was to be hoped that all the members of the Society would endeavor to bear these points in mind, and make observations upon them. He (the Chairman) believed that Mr. Varley's opinion with regard to the earth-currents proceeding from Ipswich and King's Lynn, was somewhat confirmed by the circumstance that we did not get violent earth-currents on our submarine cables generally. It seemed that the sea was so good a conductor that it prevented those great changes of potential which were found on land lines. He had considered the question whether it was best to retain the ends of a cable insulated during a magnetic storm, or to connect them to the earth. His own opinion was that the cable was safer when the ends were connected. But when they had tensions of 2,000 cells, which Mr. Varley believed to exist, it was certainly a serious thing to relieve the cables from the strain of such potentials. Certainly it would not do to attach one end to the earth and leave the other unattached. He agreed with Mr. Varley in thinking that the earth's magnetism was due to the rotation of the earth through the atmosphere. Mr. Winter had said that in the rotation of the earth there would not be a magnet rotate near a fixed conductor, but he (the Chairman) thought it extremely probable that at great elevations the tenuity of the air was so great that it remained more or less stationary.

M. Jamin states that when the current of electricity, used to magnetize a horse-shoe bar, attains a certain strength, the bar appears to return to its normal state, while either weaker or stronger currents produced magnetism. This state he terms that of concealed magnetism, and supposes it is produced by a peculiar distribution of the magnetic force.

CORRESPONDENCE.

To the Editor of the Journal of the Telegraph :

The proposition to change the character formations of the telegraph alphabet in use in the United States, suggested in your issue of the 15th, has received considerable discussion throughout the offices of the Western Union Company's lines, as far as I have been able to learn ; and as you have heretofore thrown open your columns to your subscribers and correspondents, I take the liberty to submit the following :

The Morse alphabet has been in use nearly twenty-eight years, and during this time several parties have gotten up what they called "improvements," in which the spaced letters were done away with. These "improvements" must have been brought to the notice of the telegraph authorities at the time they were gotten up, for I remember having seen copies of the "Jones" and other alphabets written on cards, and placed on the operating tables, in several offices, as long ago as 1855 ; and if there was any *real* necessity for adopting another alphabet than the Morse, would it not have been apparent at that time, and one or other of the "improvements" adopted ? I do not now remember the formation of either of them, but they certainly were less objectionable than the English alphabet, called the "Continental" (or "International"), for the latter is very cumbersome in the "numeral" characters.

Is the adoption of the "Continental," or any other alphabet than the present (Morse), needed ?

Some operators have worked a number of years past with the Morse alphabet with perfect success, and see no necessity for its being thrown aside for another at this late day ; and would it not be as well to require those employed as operators to "*write* Morse," *and as the characters were intended to be made*, and *not* change the formation of letters to accommodate *their* notions.

There is no doubt that some operators send wretchedly formed characters in transmitting business, but would they not also send the "Continental" alphabet equally bad were it adopted by the lines in this country ? It seems clear, then, that the *real* and the *best* remedy lies in the application of a test to aspirants for situations, and let those who may be found "butchering" the Morse alphabet be sent back to learn it better before applying again.

Is there any reason why so many young operators should make such badly-formed letters, when others do not find it difficult to make them correctly ? Some test should be applied, and some examination gone through with, and if that fail, then a change of alphabet could be considered.

As to its being better for American operators to know and use exclusively the alphabet in use in Europe, is hardly a point worth maintaining or contending; for if an American operator desired to go to Europe to work, he could soon learn the "Continental" alphabet, previous to starting, while on the way, and when he begins to work in his new position, *from the force of circumstances*, there being no other alphabet in use there to bother him while he learns the new.

The change from the Morse to a new alphabet will entail upon good, as well as poor, operators the duty and labor of learning and practicing whatever is adopted—taking up valuable time needed for recreation; and, while labor and practice are considered, would it not be just as well for poor senders of Morse (and new beginners) to *learn it thoroughly* and *send it correctly*, thus obviating the whole difficulty sought to be overcome ?

J'AI PARLE.

ON THE PROPOSED CHANGE OF ALPHABET.

CLEVELAND March 22, 1873.

To the Editor of the Journal of the Telegraph :

The last JOURNAL seems to so seriously agitate the question of changing the Morse system, that I feel prompted to discountenance the idea as not only useless, but injurious. It is generally supposed, and possibly in some instances true, that a majority of errors are made by misapplying letters with spaces. My experience of about eighteen years teaches me that rarely, if ever, have mistakes been traced to this cause. I find that in the majority of cases the origin of telegraphic blunders can be traced either to want of proper judgment, fine discrimination, or quick perception on the one hand and "poor Morse," whether the letter was an A, B, or C, on the other. Hundreds of operators are to-day pounding away at the "Art," who have no more business to touch a key than a mule has to attend a constitutional convention. Morse's alphabet *cannot* be misconstrued, or misapplied. At least such is my opinion after having received from three to five hundred messages in twenty-four hours, day in and day out, during the late rebellion, from operators who took pride in their business, and who made "Morse" fly over the wires as correctly as it is given *every* beginner to learn from printed characters. Mistakes were few and far between in those days, although the rapidity of transmission then would make a fair operator's hair curl to-day. We had to make the best of our time then, as the Company only owned one wire where now they have five.

After looking carefully over the International Alphabet, I find that there will be no time gained by its adoption. And even supposing that an alphabet could be made by which sixty words per minute could be easily transmitted, where are the operators to be found who can write that rapidly ? It makes a pretty lively writer climb to put down thirty-five words per minute.

The change from Morse to any other system would result in untold annoyances, if no blunders. An operator who has been in the habit of writing Morse, would be in continual dread lest he should, in a moment of inattention, sandwich in a Morse letter or two, completely demoralizing the sense of any word where the Morse letters wouldn't fit well. I cannot see why the "Morse" should be changed because the European system is different. What has the alphabet in Europe to do with our system ? It is not used over the cables and cannot be. Morse is Morse all over America, and, to throw in a little patriotism, I don't go in for aping other nationalities, especially when we are so well fixed as at present. It would be no great task to learn this new alphabet, but the difficulty would arise in mixing it with Morse.

In conclusion I would only suggest to all operators: "Strive to write Morse as it is printed, use proper care in the transmission of tangled words; use judgment in sending a knotty message ; keep your minds upon your business *always*, and I'll guarantee that our present system will not be butchered.

C. F. S.

AUGUSTA, GA., March 11, 1873.

To the Editor of the Journal of the Telegraph :

Please give us the number of words in the accompanying message, through the columns of next JOURNAL : "Augusta quiet, unchanged ; Liverpool tending down ; New York nineteen and five-eighths ?"

Answer.—There are eleven words.

AUGUSTA, GA., March 11, 1873.

To the Editor of the Journal of the Telegraph ;

Either there is some obscurity about Rule 9, or nearly all of our offices are wrong in counting the word "New York." I maintain, according to Rule 9, when it is applied to markets, &c., it should be counted as two words. For instance: New York market, three words when applied to the city or State, one word. Please read Rule No. 9 carefully, and let us hear from you. It gives New York as an example.

AUGUSTA.

Answer.—New York is always to be counted as one word, except when it is used to designate a *thing*, The question in this case is, is "New York market" a thing ? We decide that it is, and that it should be counted three words. If the word market was not used in the context, New York would be but one word, even though the application was inferentially the same.

NEW YORK, March 18, 1873.

To the Editor of the Journal of the Telegraph :

I know of an operator being transferred, February 15th, from, we will say, "B" office to "C" office; he was getting sixty-five dollars per month at "B," and was to get the same at "C." Manager at "B" paid him thirty-two dollars fifty cents for half of the month—fifteen days ; manager at "C" paid him thirty dollars eighteen cents, making total amount sixty-two dollars and sixty-eight cents, claiming that he had paid the former operator the balance for fifteen days. The operator commenced at "C" the 16th, therefore putting in full time. Now, should he not have been paid accordingly ? I have talked with a number about it, and they all think he ought to have full pay ; but we cannot convince the manager at "C" that the operator should. By answering this question you will greatly oblige,

"G. J."

Answer.—The manager at C was right in paying $30.18 for thirteen days' service, at the rate of sixty-five dollars per month. The manager at B should have allowed $34.82 for the fifteen days he was at that office. This, of course, applies to the month of February.

ORRVILLE, O., March 25th, 1873.

To the Editor of the Journal of the Telegraph :

Would it not be well to instruct operators and clerks when taking in a message to make inquiry as to where the person addressed is to be found? The lines are constantly burdened with office messages, stating that "John Smith lives five miles in the country, how shall we deliver?" These are generally death or sickness messages, and are frequently delayed several hours in waiting for a delivery guarantee.

W.

Answer.—Receivers of messages have frequently been instructed that it is their duty to obtain full directions upon every message. Managers should see that receivers understand the importance of this matter.

OPELIKA, ALA., March 22, 1873.

To the Editor of the Journal of the Telegraph :

The JOURNAL of March 15th just received, and in which there are articles regarding the Morse alphabet and a change therefrom. I beg leave, also, the privilege of saying that, although we have been accustomed to the present one from the beginning, and it might be an arduous task for some of the old hands to adopt a new alphabet, yet, if it be better, let us have it at once, so that we can learn it and practice it during the present year, and be ready to adopt it as a whole when '74 swings into line.

O. P. LIKA.

Digitized by Google

COWAN, Tenn., Feb. 28th, 1873.

To the Editor of the Journal of the Telegraph:

Why do two cups of Callaud battery used as local to work one sounder consume more sulphate of copper and zinc than ten cups of same kind used as a main on twenty miles line with three offices?

The main will work well about six months without being taken down or any attention except to supply the evaporation with soft water. On the other hand, it becomes necessary to supply the local with sulphate of copper and clean the zincs once in every ten days.

What is neeessary to make the local as constant and as easily kept up as the main?

J. M. STEWART, Manager.

Answer.—The consumption of zinc and sulphate of copper in a battery is inversely proportionate to the resistance of the circuit in which the battery is worked. This resistance being much less in the local than in the main, the consumption in the former is greater than in the latter.

E. S. CARL LEE.—There is no play called the "Telegraph Scene." Boucicault's drama, "The Long Strike," contains a scene which is popularly known by that name.

GEO. H. HAMMOND.—The effect produced upon telegraph wires by lightning and by auroral currents is the same as that produced by a battery, except that the currents are of greater tension. If these currents were regular and steady there would be no trouble in utilizing them. Long circuits have frequently been operated with auroral currents. The atmosphere at all times contains more or less electricity. The origin of thunderstorms is very imperfectly understood. All ideas upon the subject are merely theoretical.

J. M. S.—The kind of battery referred to by Duplex in the JOURNAL of Feb. 15th, represented as working thirteen sounders, was probably the form ordinarily used. The effect under the conditions mentioned would be the same in any form.

OPERATOR, K.—There is always a consumption of *materiel* going on in a battery, of course greater when in action than when the poles are separated. There is no way by which this waste can be prevented. A main line sounder will work well without a relay upon a line 2½ miles in length. The cost of such an instrument is not materially greater than that of the ordinary local sounder.

E. H. WALKER.—There is no battery called the Morse Local Battery. The Daniell is the form generally used for local purposes. There is no patent upon any portion of this battery. Various modifications and improvements have, however, been patented. Porous cups are made in the same manner as ordinary unglazed earthenware.

Q.—Algebra is employed in calculating measurements in electrical problems, because it is the easiest and most simple way to arrive at a result, but it is not essential. The Duplex system doubles the capacity of a wire in transmission of messages by allowing two different messages to be sent at the same time. That is, a message may be going from New York to Chicago at the same time that one is being sent from Chicago to New York, upon the same wire. Nothing, however, is saved in labor, two operators being required at each end of the line, one to receive and one to send. We shall be glad to assist you in your efforts to acquire a greater knowledge in the telegraphic art. Don't be afraid to ask for information.

D. H. Youngs.—Your paper is mailed regularly. If you do not receive it it is the fault of the postal service, for which we are not responsible.

H. H. Pierce.—See answer to D. H. Youngs.

FOREIGN TELEGRAPHIC ITEMS

THE demand for shares of the New York, Newfoundland, and London Company has been in advance of the supply, owing to the fact that—in anticipation of the amalgamation with the Atlantic companies—a scheme is in preparation for the separation of the land rights from the telegraphic concession of fifty years, and developing them for the benefit of the shareholders; and it is anticipated that they will represent a bonus equal to £4 per share to the holders of the Newfoundland shares.

THE report of the Telegraph Construction and Maintenance Company, submitted to the meeting on the 11th inst., shows a net profit for the year, including £10,481 brought from last account, of £79,945, of which £22,410 has been absorbed by the payment of an interim dividend of 5 per cent., and a further distribution of £1 4s. per share is recommended, making a total of 15 per cent, free of income tax, leaving £12,715 to be carried forward. The report was adopted.

THE cable for the duplicate French Atlantic line from Land's End to New Nork, *via* Halifax, will be submerged during the Summer; the Eastern Telegraph Company's duplicate cable, between Porthcurno and Lisbon, touching at Vigo, will be laid in June; and a contract has been entered into for manfacturing 3,866 miles of cable, to be submerged between Portugal and Brazil in 1873 and 1874.

THE West India and Panama Company have now resolved to complete the system from Jamacia to Colon, and to put into an effective condition the whole of the cables, and arrangements are now in progress with the Telegraph Construction Company for effecting these objects.

THE annual meeting of the shareholders of the Indo-European Telegraph Company was held Feb. 28th, the Hon. Robert Grimston presiding. The chairman said he had hoped that they would be able to share a dividend, but they had found that cheap maintenance was synonymous with bad maintenance. In February of last year the lines were working well, and continued to do so throughout the months of March and April, but in the following months the lines broke down, and he found that when they had once lost their customers they had great difficulty in getting them back again; and since July the rate had been reduced by the Telegraphic Convention at Rome from £4 10s. to £4. By this they had lost more than 4s. on every message, or one-eighth of their total revenue, without any corresponding advantage.

THE traffic returns on the Great Northern Telegraph Company's lines for the month of February were as follows:—European lines: February, 1872, revenue, 92,242 francs; February, 1873, revenue, 87,398 francs; China and Japan lines, February, 1872, revenue 82,998 francs; February, 1873, revenue 79,230 francs. In Europe the Danish-Russian cable has been interrupted from the 1st to the 22nd of February. In China the Hongkong-Shanghai cable was interrupted at the beginning of the month, and not restored until the 22d of February, when the Amoy station was simultaneously opened.

A COMPANY has been formed under the title of the Black Sea Telegraph Company, for the purpose of laying a submarine cable from Odessa to Constantinople, under concessions from Russia and Turkey. The chairman of the board will be Mr. C. F. Tietgen, chairman of the Great Northern Telegraph Company; and the directors are Mr. H. G. Erichsen, Mr. F. Daniel Gooch, Mr. Spencer Chapman, and Mr. Philip Rawson.

THE prospectus of the DirectUnited States Cable Company has just been issued at London. The capital is £1,300,000, in 65,000 shares of £20 each. The cable, which is to connect Ireland with a point on the New Hamshire coast, will be made by Messrs. Siemens; the contract price for manufacturing, laying, and maintenance for thirty days afterwards, being £1,211,000. The shares are now at ¾ to 1¼ premium.

THE report of the India Rubber, Gutta Percha, and Telegraph Works Company has been issued. In addition to completing contracts for Her Majesty's Government, the company has manufactured and delivered a cable during the year for the River Plate Company, and has made and laid a cable from England to Spain for the Direct Spanish Telegraph Company. The company is now engaged in manufacturing the third cable for the International Ocean Telegraph Company of New York, with which the *Dacia* will shortly proceed to Havana for the purpose of laying.

THE number of messages sent by telegraph between England and India, and India and England, in August last, was 3,266, which is nearly the monthly average. The bulk went by the Red Sea, viz., 2,298; of the rest, 808 were sent by Teheran, and 160 by Turkey.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ending the 22d of February, 1873, and during the corresponding week of 1872 is, February 22d, 1873, 297,679; February 24th, 1872, 243,016; increase this year 54,663.

The following is a statement showing the total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended the 1st of March, 1873, and during the corresponding week of 1872:—Week ended March 1, 1873, 301,131; week ended March 2, 1872, 235,259. Increase in the week of 1873 on that of 1872, 65,872.

THE Eastern Telegraph Company have declared an interim dividend of 3s. per share for the quarter ended the 31st of December, payable on the 15th of March.

THE Mediterranean Extension Telegraph Company report the usual half-yearly dividend on the 8 per cent. Preference Stock, less income-tax, and a dividend equal to 3 per cent. per annum on the ordinary share capital, free of income tax, both payable on the 1st of March, subject to the receipts from Italy of the remittance expected, leaving a balance of £688, to be carried to the reserve fund.

The Telegraph Construction and Maintenance Company has declared a dividend of £1 4s. per share. Much disappointment is felt by the shareholders, as double the amount was expected, and the shares declined considerable in consequence.

THE traffic receipts of the Eastern Telegraph amounted for the month of February to £30,284, and for the corresponding month of last year to £31,207, showing a decrease of £923.

AUSTRALIAN advices state that the question of subsidising the Australian cable is not yet finally decided.

AT the meeting on Tuesday of the Submarine Telegraph Company, the report of the directors announcing a dividend for the half year at the rate of 15 per cent. per annum was adopted.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
April 1, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Jacksonville, Ala., re-opened.
Boca, Cal., closed.
Bridgeport, Cal., closed.
Gallatin, Cal., closed.
St. Francisville, Ind., closed.
Strawberry Point, Iowa, changed to Enfield.
Kittery, Me., closed. Business will be delivered from Portsmouth, N. H.; charges for delivery, 15 cents.
Plympton, Mass., closed.
Barnett's, Mich., changed to Shelby, Oceana Co.

The rates given below for offices in Minn. (see list of Minn. offices in the tariff book) are the rates for other lines from La Crosse, Wis., and should be added to the rate to that office. Check business for these offices to Chicago, Ill.

Albert Lea,	55 and	4
Alden,	55 "	4
Brownsdale,	50 "	4
Delavan,	60 "	4
Fountain,	40 "	3
Grand Meadow,	50 "	4
Hokah,	25 "	2
Houston,	30 "	2
Lanesboro,	40 "	3
Oakland,	50 "	4
Rushford,	35 "	3
Spring Valley,	45 "	3
Wells,	60 "	4
Whelan,	35 "	3
Winnebago City,	65 "	4

Business for Kingston, N. J., will hereafter be checked to Monmouth Junction, N. J., instead of Bordentown.
Neshanic, N. J., closed.
Chautauqua Station, N. Y., changed to Moon's.

Messages may be taken for Berlin Heights, O., to be delivered from Ceylon, O.; charges for delivery, 10 cents.

Corvallis, Or., re-opened.
Langdon's, Pa., closed.
Yatesville, Schuylkill Co., Pa., re-opened.
English Camp, W. T., closed.

Hereafter the "tariff for other lines" to Freeport, Port Blankly, Port Gamble, Port Madison, and Port Townsend, W. T., will be 50 †25 from Seattle, W. T.; check San Francisco, Cal.

† Each additional five words or less.

* La Crosse, Wis., is now a W. U. office and should be checked direct square 190. Present rates not to be increased.

NEW OFFICES.

376 Mumford, Ala.

OFFICES HAVING "SPECIAL SHEET A."

Will hereafter check Williamsport, Milton, 45 cents; Danville, Rupert, and Catawissa, Pa., 40 cents more than special rate to Philadelphia, Pa. Present rates must not be increased.

Half-rate messages may be taken for and received from Bonham, Texas.

In Supplement to JOURNAL, March first, the following corrections in West Virginia should be made: Charleston, Kanawha Co, Coalburg and St. Albans are not closed.

Alderson should read: { 65 4 203 Huntington, W. Va.
{ 35 2 133 Greenbrier, W. S. Spgs.

ATLANTIC CABLE.

REDUCTION OF RATES.

On and after May 1st, 1873, the tariff for Atlantic cable messages will be as follows:

TARIFF OF RATES, PAYABLE IN GOLD, TO ALL POINTS IN GREAT BRITAIN, IRELAND AND FRANCE.

NOTE.—The 10 word minimum on business to or from Great Britain and Ireland is abolished.	*To Great Britain and Ireland.*	*To France.*	
	For each word.	*For ten words or less.*	*For each word over ten.*
From New York City, and all points in Nova Scotia, New Brunswick and New England States	.75	$7.50	.75
From all points in New York (except New York City), New Jersey, Pennsylvania, Delaware, Maryland and District of Columbia	.78	7.80	.78
From all points in Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan and Wisconsin, from St. Louis, Mo., and from Western Union Company's offices in Florida	.90	9.00	.90
From all points in Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dacotah, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California, Arizona, Oregon and Washington Territory	1.00	10.00	$1.00
British Columbia	1.10	11.00	1.10

Note.—Rates to points beyond London and France will be computed by adding to the reduced rate to France after May 1st.

Messages for Egypt, addressed "via Malta," will be charged for as follows:

	Not exceeding 10 words.	*Not exceeding 20 words.*
Alexandria	$5.00	$7.50
Cairo and Suez	5.62	8.50
Suez Canal and Isthmus of Suez	5.62	8.50

Half the 20 word rate to be charged for every additional 10 words, or fraction thereof, above 20 words.

WILLIAM ORTON,
President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
New York, March 26th, 1873.

On and after April 10th, money order offices will be established in the following named points in C. O. Rowe's district:

BUTLER, Pa.
FOXBURG, "
GREECE CITY, "
ST. PETERSBURG, "

G. H. MUMFORD,
Vice-Pres't.

EXECUTIVE ORDER.—No. 146.

NEW YORK, March 20th, 1873.

All messages covered by stamps will hereafter bear the word "stamp" in the check. In transmitting a twelve word message, for example, the check will be 12 D. H. stamp. Where the reply is covered by stamps attached to the original message, under the rule the check will be 12 D. H. stamp 33. *No replies to stamped messages will be sent free unless the signal 33 is contained in the check.*

G. H. MUMFORD,
Vice-President.

ANOTHER CABLE.

A company is organizing in London for the purpose of laying a cable from the coast of Ireland to a point on the coast of New Hampshire, where it is to join the wires of the land telegraph. A contract has been entered into for the manufacture of the cable, which will be 3,000 miles in length, will cost $6,055,000, and is to be completed early in 1874. The prospectus states that Anglo-American stock is now at 60, and French Atlantic at 50 per cent. premium. It is estimated that if the Company charges only 42 cents per word, it will realize 15 per cent. on its capital of $6,500,00. The members of the Council in New York are Mayor Havemeyer, Messrs. H. G. Stebbins, P. C. Calhoun, Henry Clews, P. N. Spofford, Edward Haight, John Duff, James W. Brown, and E. A. Straw.

THE River Plate and Brazil Telegraph Company (whose prospectus has just been issued) have recently obtained exclusive privilege for forty years from the Brazilian Government for a submarine cable to connect Rio de Janeiro with Uruguay, where the line will join that of the Monte Videan and Brazilian Telegraph Company, and thus establish through communication with the principal cities of the River Plate, whence, by the Transandine land line, there is already direct telegraphic intercourse with the Pacific at Valparaiso. The cable is in course of manufacture by Messrs. Seimens, and is to be laid by the 15th of August next, and within about ten or eleven months of that date the completion of the line of the Brazilian Submarine Company will place the whole system in communication with Europe.

Too late for announcement in the JOURNAL of the 15th ulto., came the notice of the death of H. Frank Thurber, which occurred at Stevenson, Ala., March 13th. He was drowned on that morning in the little spring branch running through the town. He was walking leisurely on the bank of the stream, and was seen by three ladies to suddenly throw up his hands, turn around two or three times, and then fall into the stream face foremost. The ladies ran to him; his feet and legs were on the bank, and his chest and face in the water. They pulled him out, and he struggled two or three times as if strangled, and then died. The Coroner's jury declared that he was taken with syncope, and falling into the water was unable to extricate himself. Mr. Thurber was for many years an operator at 145 Broadway, New York. He leaves a wife and brother in New York. His father, Dr. Thurber, lives in Oswego, N. Y. His body was taken charge of by the Masons, of which order he was a member.

Mr. Thurber was employed as operator down to a year previous to his death, in the office at 145 Broadway. He was one of the founders of the Association and was well known throughout the country.

THOMAS D. WHIPPLE, operator at Hightstown, N. J., desires information regarding the widow of J. J. Walker, who was formerly line repairman between Council Bluffs and Clinton, Iowa. She is supposed to reside somewhere in Michigan.

The present address of Harry West is wanted.

Mr. West was a member of the U. S. M. Telegraph Corps, Department of the Cumberland, and was stationed for a time at Christiana, Tenn.

Will some friend give the desired information through the JOURNAL.

DEEP-SEA TELEGRAPHS.

It appears from recent statistics that, with the exception of the Atlantic lines, deep-sea telegraphs do not "pay." The list of dividend-paying companies is a very short one, including only five lines out of an aggregate of fifty—namely, the Anglo-American, French, Eastern, Cuban, and Chinese. The Anglo-American and French lines pay 12 per cent.; the other four, less than 5 per cent., on an aggregate capital of $20,000,000. The London *Economist*, citing these facts, and quoting from Sir James Anderson's pamphlet on the same subject, explains the reasons for the lack of profit. As distance increases, social messages diminish, and the majority of the companies are thus limited to news and business despatches, for which high prices are charged. The Eastern Company suffers from the competition of the land lines to India, which are not very profitable enterprises, and on almost all points, as far East as Alexandria, it is also exposed to the competition of various European lines. One of its latest antagonists is the Direct Spanish Telegraph Company, which is also a submarine undertaking in active operation, though it has not been so long enough to test its profits. The *Economist* prophesies that as $5,000,000 are more than enough to make and lay a new Atlantic Cable, capable of clearing 10 per cent. per annum, it is almost certain that there will be a competitor for a third or fourth share of the net $2,000,000 per annum which Atlantic telegraphy yields. Amalgamation of companies, however, is the order of the day, and in the event of a general combination there can be no successful competition.

THE TELEGRAPH IN RUSSIA.

In January, 1869, the number of telegraph stations throughout Russia was 380, and the number of telegrams despatched in the empire of the Czars in 1868 was 1,491,834. In January, 1872, the number of Russian telegraph stations had increased to 648, and from these offices 2,860,649 telegrams were despatched during 1871.

THE TELEGRAPH IN WESTERN AUSTRALIA.

Progress is being made with a telegraphic line between Perth, Western Australia, and Albany, King George's Sound. A line from Perth to Bunbury is to be extended as far as Bassetton, the port and principal town of the Vasse district in Western Australia, and a new line from Newcastle to Geraldton, Champion Bay, is to be commenced in a few weeks. The jarrah posts for this line are to be supplied at a cost of £19 9s. per mile, by Messrs Smith and Nunan; the former of these gentlemen constructed the line to Bunbury.

THE TELEGRAPH IN NEW ZEALAND.

A return, as to the length of telegraphs existing in New Zealand, shows that in 1871 that colony had 3,286 miles of line. In 1870, the corresponding length was 3,162 miles; in 1869, 2,777 miles; in 1868, 2,637 miles; in 1867, 1,447 miles; and in 1866, 1,398 miles.

CONCESSION FOR CABLE COMMUNICATION WITH THE UNITED STATES.

The Portuguese Minister of Public Works has asked the Cortes to ratify a concession for a cable between Portugal and the United States, touching at the Azores. The contract for laying the cable has been signed.

BLASTING BY ELECTRICITY.—The *Aberdeen Free Press* says: On Monday a further experiment was made with electricity as a means of firing blasting charges in Mr. Fyfe's quarries at Kemnay. A huge breast of rock, calculated to weigh about 2,000 tons, was bored in eleven places, charged and fired almost simultaneously by a current of electricity from a battery which was under the care of Mr. David Wright, electrician, Aberdeen. The huge mass was started with little noise from the report, but with a rumbling sound like that of distant thunder. A second blasting was fired on Tuesday. Although the ground was covered with snow, and a heavy snowstorm was falling, wires extending 1,500 feet in length being laid, and a current of electricity put on, in an instant a tremendous explosion was heard, which shook the ground like an earthquake. Great masses of granite were upheaved in the air, and about 5,000 tons were displaced. It is the largest blast which has ever been witnessed in these quarries, effected by means of electricity applied by a new apparatus most ingeniously constructed.

BORN.

BARNARD.—At Dodson, O., March 3, 1873, to J. E. Barnard, Manager W. U. Tel. Office, a daughter.

CLARK.—At Canal Dover, O., March 17, 1873, to Tom. C. Clark, Manager W. U. Tel. Office, a son.

MEAD.—At Jamestown, Ind., March 20, 1873, to W. S. Mead, Manager W. U. Tel. Office, a son.

MARRIED.

GLASS-PROBASCO.—At Anderson, Ind., March 6, 1873, W. H. Glass, Manager W. U. Tel. Office, Knightstown, Ind., to Miss Mattie Probasco, of Knightstown, niece of Hon. Henry Probasco, of Cincinnati.

POST-LAWRENCE.—At the residence of the bride's father, San Francisco, Cal., March 1, 1873, by Rev. John Kimball, Arthur H. Post, Supt. Supply Dept., Pacific Division, W. U. Tel. Co., to Harriet E. Lawrence.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, APRIL 1, 1873.

FREE BUSINESS NOT COVERED BY FRANKS.

There is no regulation more frequently disregarded than Rule No. 48, which provides that:

"Private messages between employés of the Company must be restricted to those of an urgent social character, and approved by the manager of the office from which they are sent. *Copies of such messages must be regularly checked and returned with other free business.*"

It is not desired to limit the privilege accorded by this rule, but the forms under which these messages should be sent must be strictly adhered to. Every free message, not covered by a frank, must contain in its check the reason why it is sent free. If free by reason of it being stamped, the check should be "10 D. H. Stamp." If free for a superintendent, "10 D. H. Supt." If for a manager, "10 D. H. Mgr.", and for an operator, "10 D. H. Opr."

Managers are instructed, and required to observe, that when a free message is received at their office, to be forwarded or delivered, the check to which does not conform to the requirements of the rule, it is their duty to hold such message, until, by enquiry of the manager of the sending office, the fact is ascertained that the transmission is authorized.

For the fulfilment of this order, managers are responsible, and will be held to a strict account.

In this connection, attention is directed to Executive Order No. 146, which appears on page 134. It relates to the checking of messages and answers thereto, which are covered by stamps.

MANAGERS of offices in returning with their monthly (No. 4) reports, the business done under "red" Franks, should enter such on a separate blank from press or other half-rate messages, and enclose the statements, "Refunded under Executive Order, No. 127." All such messages should bear on their face the amount of tolls, at full rates, and the number of rank on account of which one-half of the (full) tolls is refunded.

SERVICE messages of Commercial News Department, such as enquiries as to errors in, and for missing, or delayed reports, and answers thereto, should be considered as office messages. All others should be reported, and returned with free message reports.

THE INTERNATIONAL MORSE ALPHABET.

For general information, we give herewith the form of alphabet which is used by telegraphers in every country except America. This form originated with the Germans, who have carefully studied the subject, and so arranged the alphabet that the letters which are most frequently used contain the shortest signals. Each of the figures are composed of five elements, systematically arranged, the first half checking the second, and so rendering them as free from ambiguity as they are easy of recollection by the mind. There are thirty-two characters in the alphabet, those in addition to the ordinary twenty-six being necessary to cover peculiarities in the French, German and Spanish languages.

A	·—	V	···—
B	—···	W	·——
C	—·—·	X	—··—
D	—··	Y	—·——
E	·	Z	——··
F	··—·	Ch	————
G	——·	Ä	·—·—
H	····	Ö	———·
I	··	Ü	··——

K	—·—	Ñ	——·——
L	·—··	1	·————
M	——	2	··———
N	—·	3	···——
O	———	4	····—
P	·——·	5	·····
Q	——·—	6	—····
R	·—·	7	——···
S	···	8	———··
T	—	9	————·
U	··—	0	—————

Period (.)	····——
Comma (,)	·—·—·—
Query (?)	··——··
Exclamation (!),	——··——
Apostrophe ('),	·————·
Hyphen (-),	—····—
Fresh paragraph,	·—·—·
Inverted commas,	·—··—·
Parenthesis,	—·——·—
Understand,	···—·
Wait,	·—···
Erase,	·····
Call signal,	—·—·—·—
End of message,	·—·—·—
Cleared out all right,	·—···—·—·
I don't understand,	··——·····——··

The accented é is important in French to distinguish between the past participle and the present tense. The apostrophe is equally necessary in French, thus: C'est, l' intention, de l' Empereur, &c.

The ä ö ü are important in German.

The Spanish ñ is seldom used.

The period (.) is generally written in three pairs, the mind counting 3 more easily than 6, thus:

·· ·· ··

The erasure is frequently divided into 3 threes, and for the same reason. Thus:

····· ····· ·····

It is used as follows:

Suppose the operator to have mispelled a word, he gives the nine dots (the erasure signal), goes back to the word before the error, repeats it, and continues.

PROGRESS OF THE ELECTRIC TELEGRAPH IN AMERICA.

The progress of the Electric Telegraph upon the American continent is only to be traced through the operations and the record of the many companies which have existed under its name. Despite the discouraging checks and deterring obstacles occasioned by the want of success in business management, and the limited experience of those who controlled the early organizations, the march has been steadily onward. So closely has it become identified with the necessities of almost every business interest, and the facility with which it is adapted to many services, enhancing human comfort and welfare, that at this day he would be bold indeed who would undertake to set a limit to its power and capacity.

During the first few years after the introduction of the electric telegraph into this country, its progress was very slow and its future success doubtful. The first line was constructed between Washington and Baltimore in the Spring of 1844, through aid furnished by Government; but the results of its operation were so unsatisfactory that the Postmaster-General, in his report for 1845, expressed the opinion that the revenue could not be made to equal the expenditures under any rate of charges which might be adopted. As the Government declined to assume the ownership and control of so doubtful an undertaking, the inventor had no recourse but to appeal to the enterprise of the people for the means required for its development. Capitalists, however, were slow to invest in a scheme so novel and precarious, and, as a natural consequence, there was great difficulty in obtaining funds wherewith to build lines. Companies were, nevertheless, organized in various parts of the country, and lines were built in detached sections between the more important places, but without any general plan of coöperation.

The invention of the letter-printing telegraph by Mr. House, in 1846, and the introduction of the electro-chemical telegraph of Mr. Bain into this country, in 1849, however, greatly facilitated the construction of competing lines.

The first line operating under the House patent was completed in March, 1849, from Philadelphia to New York City. The line of the Commercial Telegraph Company between Boston and New York, using the same patent, was completed in the autumn of the same year, and was followed by one from New York to Buffalo, and subsequently to St. Louis and Chicago.

During the year 1849, which was very prolific in the production of competing lines, the Bain patent was introduced upon lines extending between New York and Buffalo, and New York and Washington,

Digitized by Google

and, in the succeeding year, upon lines extending between Boston and Montreal, Boston and Portland, and Boston and New York.

In 1851 there were seven Bain lines in operation in the United States, having over 2,000 miles of wire; eight House lines, having 3,000 miles of wire; and sixty-seven Morse lines, having 20,000 miles of wire. In the autumn of this year, the Morse and Bain lines between New York and Washington were consolidated; and in the succeeding Spring the Morse and Bain lines between New York and Boston were united under one company. The union of these lines was followed by that of the New York and Buffalo Morse and Bain lines, and subsequently by those of the House lines between these points. The consolidation of these lines was a step in the right direction, as it increased the receipts and lessened the expenses of the companies, while it enabled them to do the business better, by possessing greater facilities. Still, the great number of separate organizations remaining throughout the country prevented that unity and despatch in the conduct of the business so essential to its success. Under these circumstances, the public failed to realize the brilliant thought of instant communication between distant points.

The lines in the South and West were undergoing a similar experience to those in the East. One only, the Magnetic Company, with wires from New York to New Orleans, on the seaboard route, was barely paying expenses, the others all being operated at a loss. At the then existing rates of tariff, there was, probably business sufficient to maintain one company upon each route, but upon every route competition was always found, and the division of business was ruinous.

It was at this period that a few clear-sighted men in the West conceived the project of buying up the groups of feeble organizations, and making them direct leaders between the larger Western cities. The stock of the existing companies was of little value, and was easily and cheaply secured. An act of incorporation was obtained from the State of New York, and in April, 1851, an organization was effected under the name of the New York and Mississippi Valley Printing Telegraph Company, for the purpose of building a line from Buffalo, N. Y., to St. Louis, Mo. This was the origin of the present Western Union Telegraph Company—of the splendid system of telegraphs which so nearly approaches perfection as to seem almost marvelous.

During the next six years this Company acquired, by purchase, lease or consolidation, all of the lines which were being operated in the section of country bounded by Buffalo, Chicago, St. Louis and Pittsburgh, with the exception of the Atlantic and Ohio Telegraph Company's wires. In all this time the surplus earnings were devoted to the construction of new wires within their territory, and in the improvement of the old.

In April, 1856, by an Act of the New York Legislature, the name of the New York and Mississippi Valley Printing Telegraph Company was changed to that of the Western Union Telegraph Company. In May, 1856, this company acquired the Pittsburg, Cincinnati and Louisville lines; in July, 1857, the Southern Michigan line; and in December, 1863, the New York, Albany and Buffalo lines; in April, 1864, the Atlantic and Ohio lines; March, 1864, the Pacific Company's lines; in August, 1864, those of the Alleghany Company and the line of the Ithaca Company. Their wires across the plains and over the Rocky Mountains to California was completed in 1862.

At the East and South, the American Telegraph Company, organized in 1855, followed a similar course, and ultimately controlled lines extending throughout the Atlantic seaboard and Mississippi Valley. This company had purchased the line of the Commercial Telegraph Company, better known as the House line, between New York and Boston, and acquired, by lease, the control of the lines of the Maine Telegraph Company, extending from Boston to Calais, Me., and those of the Nova Scotia Telegraph Company, connecting Calais with Halifax. In 1859 consolidation was effected with the New York and Washington House Printing, the Magnetic, and New York and New England Union. It also acquired possession of the Troy and Canada Junction, Long Island, St. John and Frederickton, and Richmond, Charlotteville and Staunton lines; and subsequently those of the Cape Cod, Cape Cod Marine, Vermont and Boston, Lynchburg and Abingdon, East Tennessee, Delaware and Hudson, Philadelphia and Wilkesbarre, Susquehanna, Baltimore and Ohio, Washington and New Orleans, and Southwestern Telegraph Companies' lines. The American Company, in short, had followed in the Eastern and Southern sections of the country a similar course to that pursued by the Western Union Company in the West; and by purchase, consolidation and construction, controlled lines extending throughout the Atlantic coast and the Mississippi and Ohio Valleys.

These two companies, working in connection and harmony, covered the entire area of the United States, and performed the business of telegraphing better than it had ever been done before.

In 1863 the United States Telegraph Company was organized, and constructed a system of rival lines, embracing sixteen thousand miles of wire, and covering considerable portions of the territory occupied by the Western Union and American lines. The United States Company, however, under the most vigorous administration, with all of its lines new and worked to their utmost capacity, was unable to meet its current expenses—the net loss, during the last year of its operation, amounting to an average of more than ten thousand dollars per month.

In April, 1866, the lines of the United States Telegraph Company were consolidated with the Western Union, and, on the 1st of July following, the lines of the American Compauy were brought under the same management.

The numerous consolidations of lines throughout the country which have been going on almost uninterruptedly for over fifteen years, had now resulted in a complete unification of the great majority of the telegraph lines in the United States, and rendered the system the most extensive and efficient in the world. No monopoly of the business, however, was obtained. The Morse patent having expired, and no exclusive privileges being granted by either State or national governments, the construction and operation of telegraph lines within the jurisdiction of the United States remained freely open to all.

From this time dates a new era in the business of telegraphing on this continent. The enormously increased facilities given to the public became rewarded by a proportionate increase of traffic. Many reforms in the manner of conducting the service were introduced, among them direct working between far distant points, thus saving the time incurred by the frequent repetitions which heretofore had been thought necessary, and proportionately decreasing the labor and cost of transmission. A new impetus was afforded for developing improved machinery for operating the lines, the consolidated companies having both the will and the means to afford aid in that direction, which assistance could not have been given with the same effect under the old arrangements.

Telegraphy, since 1866, has made a great advance. It has leaped, as it were, from the condition of doubt and indecision, into the full knowledge of its strength and capabilities.

In a future article we will endeavor to record its progress during the past six years.

The Postmaster-General has secured for the "fountain of his telegraphic knowledge" a Governmental appointment as *artisan* to visit the coming Exposition at Vienna. The "American gentleman residing in Paris"—he of the wonderful statistics—having been appointed Honorary Commissioner for the same purpose, it is likely that an overwhelming mass of figures and information will be cooked up for operation upon Congress next Winter. This party, however, is incomplete without the "estimate" man. How came he to be overlooked?

The New York *Tribune*, in commenting upon the contemplated reduction in rates by the Western Union Telegraph Company, which was announced in the Journal of March 15th, after some speculative theories as to the cause, remarks as follows:

"Should this prove true, the reduction in the tariff may well be described as of 'the most radical and sweeping nature.' At any rate, the proposed action of the Western Union Telegraph Company is one of the strongest arguments against a Government postal telegraph. Cheap and accurate telegraphing can only be attained by healthy competition, by thoroughness and economy in management, and by the prompt adoption of the latest scientific discoveries. Can we expect these from a Government bureau?"

Mr. George H. Bliss, Superintendent of the lines of the Chicago and North-Western Railroad Company, has resigned. He is succeeded by Mr. Geo. H. Thayer, who, for the past nine years, has been Chief Operator in the General Office of that Company in Chicago. Mr. S. E. French takes the position made vacant by the promotion of Mr. Thayer.

G. H. Bliss & Co., Chicago, successors to Bliss, Tillotson & Co., advertise in this issue for good workmen.

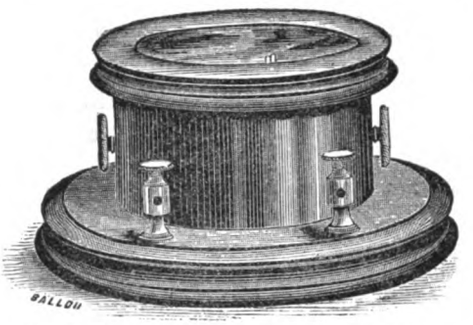
LIGHT.



According to the theory generally received at present, the whole universe is an immeasurable sea of highly attenuated matter, imperceptible to the senses, in which the heavenly bodies move with scarcely any impediment. The fluid, which is called ether, fills the whole of space—fills the intervals between the heavenly bodies, as well as the pores or interstices between the atoms of a substance. The smallest particles of this subtle matter are in constant vibratory motion; when this motion is communicated to the retina of the eye, it produces, if the impression on the nerves be sufficiently strong, a sensation which we call light. Every substance, therefore, which sets the ether in powerful vibration, is luminous; strong vibrations are perceived as intense light, and weak vibrations as faint light; both of them proceed from the luminous object at the extraordinary speed of 186,000 miles in a second, and they necessarily diminish in strength in proportion as they spread themselves over a greater space. Light is not, therefore, a separate substance, but only the vibration of a substance, which, according to its various forms of motion, generate light, heat, or electricity.

EFFECTS OF MAGNETISM ON IRON.—During the recent session of the National Academy of Sciences, at Cambridge, Mass., Professor Mayer gave some interesting information regarding the effect of magnetism on iron. He states that he has discovered, by means of the Saxton Comparator, that rods of iron suffered a permanent elongation by magnetization of one hundred and fifty millionths of an inch. English refined iron gave a maximum of elongation, scrap iron the minimum. Whether the current was gradually increased in intensity, or whether it was sent full charge at once, it produced the same degree of elongation. With one cell the elongation took place in six-tenths of a second; with twenty-five cells it took place in two-tenths of a second. Professor Pierce thought if the elongation of iron under magnetization were true, it might make its effect on the earth in an appreciable difference in the length of the day. This could be detected by astromomy. A change in the day of seven-hundredths of a second would be perfectly easy to discover now.

M. A. BUELL,

Manufacturer and Dealer in

TELEGRAPH SUPPLIES.

THE LITTLE MONITOR RELAY

Is a substantially made and good working Instrument, incased in a polished Rubber Cylinder with Plate Glass Cover, has back and front Adjustment.

EVERY INSTRUMENT WARRANTED.

Price, $10.00.

Also, LITTLE MONITOR SOUNDER, to match,
Price, $6.00.

And Small Size W. U. KEY,
Price, $4.00.

All kinds of Learner's Instruments, with Instructions, constantly on hand. Send for Circular.

M. A. BUELL,
26 WARING BLOCK,
CLEVELAND, O.

THE
LECLANCHÉ BATTERY CO.

Is now prepared to supply promptly the increasing demand for

This Celebrated Battery,

(SECURED BY LETTERS PATENT IN THIS COUNTRY)

and which is extensively used throughout Europe for

TELEGRAPHY,
RAILROAD SIGNALS,
HOTEL ANNUNCIATORS,
BELLS, ETC.

Among the numerous advantages of this Battery may be mentioned—

ENTIRE ABSENCE OF ACIDS,
ITS GREAT CLEANLINESS,
WONDERFUL DURABILITY,
GREAT ECONOMY IN RUNNING EXPENSES.

This Battery will last, without any Attention, from six months to a year.

A number of cups have been in use by the Western Union Telegraph Company, *on a closed circuit*, since Nov. 26, 1872, nothing but water having been added since they were first set up.

For further particulars apply to

THE LECLANCHÉ BATTERY CO.,

No. 40 West 18th St., N. Y.,

OR

L. G. TILLOTSON & CO.,

SOLE AGENTS,

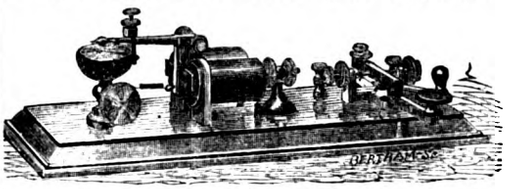
No. 8 Dey Street, New York.

WATTS & COMPANY,

Baltimore,

MANUFACTURERS OF

Electrical and Telegraph Instruments



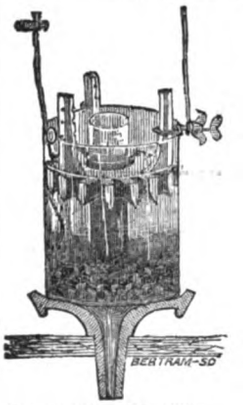
AND

MATERIAL OF EVERY DESCRIPTION,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc.

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER.



ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

SOLE MANUFACTURERS OF THE

NEW PATENT BALTIMORE BATTERY,

MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7¼ inches,
Specially adapted to Railroad Signals, Printing Instruments, etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country having proven the cheapest, and least trouble to maintain of any in the market.

Patented Dec. 31, 1872.

ALSO, SOLE MANUFACTURERS OF THE

Patent Circuit Closer Key,
O'Sullivan Self-closing Key,
Scott's Patent Hotel Annunciator

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE

PATENT BATTERY INSULATOR

shown, holding a cup of the Baltimore Battery in the above cut, which most effectually insulates the Battery as the drip passes off *through a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. PRESCOTT, says of it:—"I think your Battery Insulator is very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.

Repairers' Tools constantly on hand.

Importers and Dealers in best English and American Galvanized Wire.

MANIFOLD PAPER, for Train Orders, etc. Also, AGATE PENS.

In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices.

Chicago, Ill.

TELEGRAPHERS' EMPLOYMENT BUREAU,

TOLEDO, OHIO.

—o—

A Telegraphers' Employment Bureau has been established in this city, under the direction of several well known Telegraph Superintendents, having for its object the reception of applications for positions as operators, or operators and clerks or agents combined.

Applicants must state:

1st—Age. How long in the service. Reason for changing position. Present Salary. Sound or paper reader. Able bodied or otherwise.

2d—Applicants must send recommendations from present employer, or if not at work, from former employer as to moral character and capabilities. Recommendations to state if applicant is capable of filling positions other than operator, such as ticket agent, freight clerk, or agent.

This list will be published monthly and forwarded to the Superintendents of Telegraph Lines and a copy sent to each applicant whose name is printed thereon. All names to be published two (2) months. All applications to be accompanied by a fee of two (2) dollars.

Address,

Telegraphers' Employment Bureau,

TOLEDO, O.

THE

ELECTRIC RAILROAD SIGNAL CO.

SPECIAL NOTICE.

OFFICERS OF RAILROAD COMPANIES, and others interested, are notified that this Company is the sole owner of the ORIGINAL PATENT for operating

ELECTRIC SIGNALS

by including a section of a railroad track in the electric circuit which was issued to F. L. POPE, July 16, 1872. Railroad Companies are **CAUTIONED** against negotiating with unauthorized parties for the use of this Invention, as this Company will take legal measures to protect themselves against all **INFRINGEMENTS.**

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 10. NEW YORK, APRIL 15, 1873. WHOLE NO. 131.

ELECTRICAL MACHINES.

The first electrical machine was invented by Otto Guericke, to whom science is also indebted for the invention of the air-pump. It consisted of a ball of sulphur which was turned upon its axis by one person, while another held his hands upon the ball, thus causing the friction necessary for the production of electricity. The result was that the globe was negatively electrified, and the positive electricity escaped into the earth through the hands of the operator. This machine, however, was capable of producing only very feeble efforts, and the sparks obtained from it were visible only in the dark. An English philosopher, Hawksbee, substituted a globe of glass for the globe of sulphur; the electricity thus obtained was positive, and the sparks obtained by the new machine were of considerable brightness. The machine, however, was for the time superseded by the use of glass tubes, which continued to be the favorite instruments for generating electricity until the middle of the eighteenth century, when a German philosopher, Boze, professor of physics at Wittemberg, revived and perfected Hawksbee's machine, which became universally adopted. This machine consisted of a large wheel, round which was passed an endless cord, which, passing also round a pulley, served to turn a glass globe when the wheel was set in motion. The electricity thus produced was collected on a conductor suspended from the ceiling by silk cords.

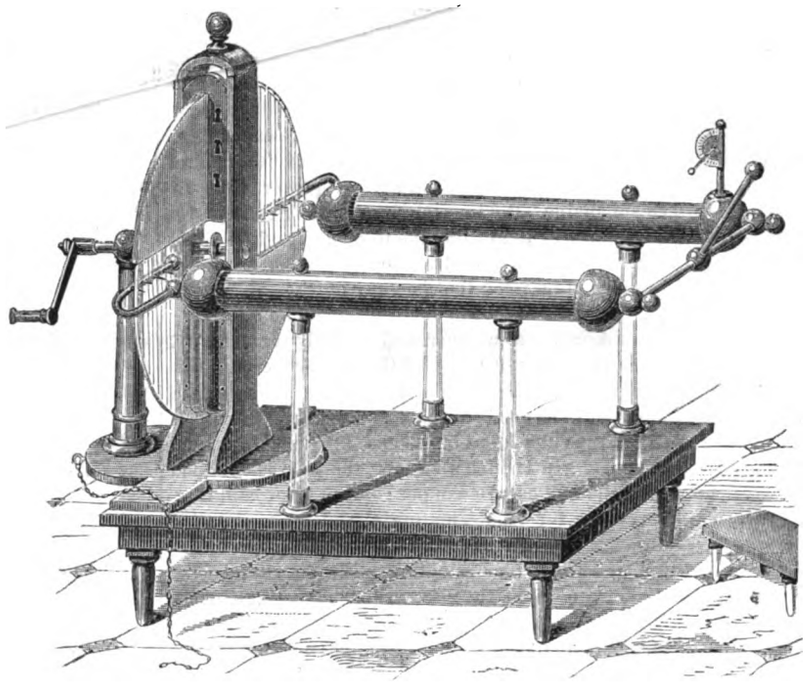

Fig. 1.

This mode of applying friction by the hand, which is evidently rude and defective, was nevertheless long used for want of a better, though many attempts were made to replace it by the use of rubbers of leather, stuffed with hair, and pressed against the globe by means of regulating screws. The shape of the globe rendered the use of these very difficult, and it was not until a cylinder was substituted for the globe that they were generally adopted.

The kind of machine most commonly employed at present is the plate-machine, invented by Ramsden about 1768, and only slightly changed and improved since.

The most usual form of this machine is shown in Fig. 1. It has a circular plate of glass, which turns on an axis supported by two wooden uprights. On each side of the plate, at the upper and lower parts of the uprights, are two cushions, which act as rubbers when the plate is turned. In front of the plate are two metallic conductors supported on glass legs, and terminating in branches, which are bent round the plate at the middle of its height, and are studded with points projecting towards it. The plate becomes charged with positive electricity by friction against the cushions, and gives off its electricity through the points to the two conductors, or, what amounts to the same thing, the conductors give off negative electricity through the points to the positively-electrified plate. In order to avoid loss of electricity from that portion of the plate which is passing from the cushions to the points, sectoral pieces of oiled skin are placed so as to cover it on both sides. The cushions become negatively electrified by the friction; and the machine will not continue working unless this negative electricity is allowed to escape. The cushions are accordingly connected with the earth by means of metal plates let into their supports.

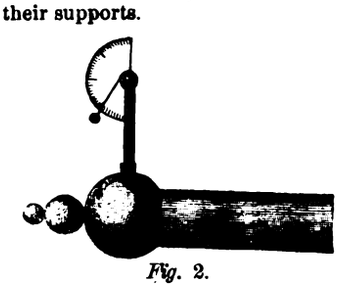

Fig. 2.

As the conductors become more highly charged, they lose electricity to the air more rapidly, and a time soon arrives when they lose electricity as fast as they receive it from the plate. After this, if the machine continues to be working uniformly, their charge remains nearly constant. This limiting amount of charge depends very much upon the condition of the air; and in damp weather the machine often refuses to work unless special means are employed to keep it dry.

The rubbers are covered with a metallic preparation, of which several different kinds are employed. Sometimes it is the compound called *aurum musivum* (bisulphide of tin), but more frequently an amalgam. Kienmeier's amalgam consists of one part of zinc, one of tin, and two of mercury. The amalgam is mixed with grease to make it adhere to the leather or silk which forms the face of the cushion.

Before using the machine, the glass legs which support the conductors should be wiped with a warm dry cloth. The plate must also be cleaned from any dust or portions of amalgam which may adhere to it, and, lastly, dried with a hot cloth or paper. When these precautions are taken, the machine, if standing near a fire, will always work; but the charging of Leyden jars, and especially of batteries, may be rendered impossible by bad weather.

The variations of charge are indicated by the *quadrant electroscope* (fig. 2), which is attached to one of the conductors. It consists of an upright conducting stem supporting a quadrant, or more commonly a semicircle of ivory, at whose centre a light needle of ivory is jointed, carrying a pith-ball at its end. When there is no charge in the conductor, this pendulum hangs vertically; and as the charge increases it is repelled further and further from the stem. In damp weather it will be observed to return to the vertical position almost immediately on ceasing to turn the machine, while in very favorable circumstances it gives a sensible indication of charge after two or three minutes.

Ramsden's machine furnishes only positive electricity. In order to obtain negative electricity, it is necessary to insulate the cushions from the ground, and to place them in communication with an insulated conductor. An arrangement of this kind is adopted in Nairne's machine.

In this machine a large cylinder of glass revolves between two separately insulated conductors. One of these has a row of points projecting towards the glass, and collects positive electricity. The other is connected with the rubber, and collects negative. If one kind of electricity only is required, the conductor which furnishes the other must be connected with the ground.

Winter, of Vienna, has introduced some modifications in Ramsden's machine.

Digitized by Google

Instead of four cushions, there are only two, which are in communication with a spherical conductor supported on a glass pillar. This may be used to collect negative electricity in the same way as the negative conductor in Nairne's machine. The chief or positive conductor consists of an insulated sphere, on the top of which is often another sphere of smaller size. The positive electricity is collected from the plate by means of two rings opposite to each other, one on each side of the plate. On the side next the plate they have a groove, which is lined with metal and studded with points. They are supported by an arm which is inserted in the positive conductor. The size of the positive conductor is often increased by the addition of a very large ring three or four feet in diameter, which is supported on the top of the large sphere. The ring consists of very stout brass wire inclosed in well-polished mahogany.

Winter's machine appears to give longer sparks than the ordinary machine under the same circumstances. This circumstance is owing, partly at least, to the considerable distance between the rubber and the positive conductor, which prevents the occurrence of discharges between them.

CAN ELECTRICITY BE UTILIZED AS A MOTIVE POWER.

Ever since the invention of the electro-magnet, by Sturgeon, this question has occupied the attention of inventors. Those who have seen a huge mass of iron made capable of attracting an iron bar with a force of several thousand pounds, and this through the agency of a few pieces of zinc and platinum of comparatively small size, cannot easily be divested of the idea that this arrangement is capable of giving rise to a powerful motor. In addition to this, however, it is a fact that electro-motors of considerable power have been constructed. The late Professor Page, under Government patronage, made an electro-motor of several horse-power; and Froment, of Paris, has for a long time carried on the manufacture of small electro-motors, intended to turn lathes, sewing-machines, etc. So that now the question is not, Can machinery be run by means of electricity? but can electricity be *profitably* employed for this purpose?

So far as the present state of the science enables us to decide, it is universally conceded that whatever the amount of power required exceeds that of one or two horses, electricity is a far more expensive agent than steam. The only persons who refuse to concede this point, are those who greatly over-estimate the amount of work done by a small motor; and those who, like Paine, of Newark, make—well, we may perhaps be allowed to say—"claims which they cannot easily substantiate." But while we freely concede that electricity is a most expensive means of obtaining power, we are inclined to believe, that, in some cases, where but a fraction of a horse-power is needed, this agent may be employed with economy and convenience. At the same time, however, we ought to bear in mind that the construction of an electro-motor that shall be capable of giving even a tolerable approximation to the result that ought to be obtained from the consumption of a given amount of zinc, demands a degree of knowledge and skill greater than is possessed by the manufacturers of most machines of this kind now in market. As this subject is at present attracting a good deal of attention, it may not be inopportune to consider a few of the conditions upon which success in this direction must depend.

Machines have already been devised and constructed which, when driven by electricity, give results that are far more economical for the power used, than is the ordinary steam-engine, with its connection. Even Rankine concedes this in his work on "Prime Movers," and considers that the efficiency of electro-magnetic engines, is "four times that of the best engines yet known." And if the electro-magnetic engines which he describes, are those from which this ratio of efficiency has been determined, we may safely double or treble it; the best engine described in his work being an old form devised by Prof. Page, and found in most American collections of apparatus, although Rankine attributes its invention to Froment. In the work referred to, the Daniell battery is regarded as the most efficient, giving 1,095,468 foot-pounds per pound of zinc; while Smee's battery gives but 694,800 foot-pounds for the same quantity of metal. In the case of Daniell's battery, a horse-power would require the consumption of about 1.8 pounds of zinc per hour, which is about one-tenth the theoretical efficiency of carbon. And setting aside the costs of acids, and allowing the electro-magnetic engine to be four times as efficient as the heat engine, it is evident that until ten pounds of zinc sell for the price of four pounds of carbon, the electro-magnetic engine cannot compete with the heat engine. When coal sells for one-quarter of a cent per pound, and a pound of zinc sells for 13 cents, the power obtained by the electro-magnetic engine will cost one hundred and thirty times the amount required for an equal amount of power from the steam-engine. But in most electro-motors, the power costs not less than from five to eight hundred times what steam power costs. To reduce this great disproportion between the economy of the two agents, every effort must be made to produce the electricity in an economical manner, and to apply it efficiently. To this end, we must see that the battery we employ is so constructed that the materials which are consumed are used in as crude a shape as possible. In all batteries, the chief items of expense are acids, zinc, and mercury. In Daniell's battery, the acid is obtained from the sulphate of copper; but the zinc and mercury used for amalgamating the zinc are supplied directly. Now, it is well known, that in the ordinary system of amalgamating zinc, the mercury is never recovered; the zinc, instead of being entirely consumed, becomes useless, even while a considerable portion remains. The remainder, which always contains the greater part of the mercury, is usually sent to the foundry to be recast, during which process a large portion of the zinc itself is wasted, and the whole of the mercury is driven off in vapor. This source of loss must be avoided; and it is easily done if the battery be so constructed that the zinc-pole may be formed of any old fragments of zinc, and not necessarily of a mass cast specially for the purpose. Moreover, by using zinc in this shape, we can employ the waste chippings of the shops, by which means the cost of the zinc is reduced fully two-thirds, and the mercury is entirely saved.

Having so arranged matters that the materials consumed will cost the least possible amount, our next object should be to obtain the greatest possible returns in the products generated in the battery. We are aware that this has always been a very attractive object with most inventors of new batteries. We have always been told that the chemicals produced in these batteries might be sold for more than the cost of the original materials; but our own experience has been that it is impossible to realize the cost of collecting them, much less the cost of preparing them. The fact is, that while such compounds as the sulphate of zinc, sulphate of iron, etc., are valuable and marketable in large quantities, they cannot be sold in small lots. Ten pounds of sulphate of zinc cannot be sold for enough to pay for the trouble of finding a market for it. The only exceptions to this are the metals. Five pounds of copper can be readily and profitably sold, and there is a market for it at every brass-foundry. We must, therefore, so arrange it that the copper-pole of the battery can be sold without making any sacrifice. If we use expensive poles, carefully fitted up, we cannot afford to dispose of them when they become heavy. Now for a Daniel's battery: a piece of stout copper wire, rolled up spirally so as to form a sort of lining to the outer vessel, is all the pole that is needed. When copper has been deposited upon it to such an extent that it is too heavy and cumbersome, it may be sent to the foundry and sold for old copper.

The last point that presents itself, is the internal resistance of the battery, and its relation to the resistance offered by the coils of the magnet. The law is that the resistance outside the battery should be exactly equal to the resistance inside; but this rule we have frequently seen most grossly violated. On one occasion, we have seen an electro-magnetic engine driven by a series of sixteen Bunsen cells, every one of which was capable of sending its full current through the coils of the magnet! But this point has been so fully discussed, that it is now pretty generally understood. Sufficient attention, however, is not given to the reduction of the resistance in the battery. Thin cells, preferably of good brown paper, a close approximation of the copper and zinc, and the use of poor conducting liquids, are the means for securing this object.

But even, after all our care, the electro-magnet engine remains an expensive mode of procuring power. Still, from the fact that it does not produce smoke, ashes, or fumes, is not dangerous, and can be used at a moment's warning, it may very possibly come into very extensive use, as soon as some intelligent manufacturer produces an article of moderate excellence. —*Industrial Monthly.*

ELECTRICAL RESISTANCE OF METALS.

THE results of some of the recent researches on the electrical resistance of various metals have been published by M. Benoit, who gives the following table of the specific resistances, at Zero Centigrade, of 1 metre in length by 1 square millemetre in section, measured by two different systems; namely, in *Ohms* and in *Siemen's Units*—and the conductivities reduced to a ratio in reference to that of silver as a standard:

	Ohms.	Siemen's units.	Silver unity.
Silver–pure, annealed	0·0154	0·0161	100·00
Copper–annealed	0·0171	0·0179	90·00
Silver–($\frac{1}{1000}$) annealed	0·0193	0·0201	80·00
Gold–pure, annealed	0·0217	0·0227	71·00
Aluminium–annealed	0·0309	0·0324	49·70
Magnesium–hammered	0·0423	0·0443	36·40
Zinc–pure, annealed at 350° C	0·0565	0·0591	27·50
Zinc–pure, hammered	0·0594	0 0621	25·90
Cadmium–pure, hammered	0·0685	0·0716	22·50
Brass–annealed	0·0691	0·0723	22·30
Steel–annealed	0·1099	0·1149	14·00
Tin–pure	0·1161	0·1214	13·30
Aluminium Bronze–annealed	0·1189	0·1243	13·00
Iron–annealed	0·1216	0·1272	12·70
Palladium–annealed	0·1384	0·1447	11·10
Platinum–annealed	0·1575	0·1647	9·77
Thallium	0·1831	0·1914	8·41
Lead–pure	0·1985	0·2075	7·76
Maillechort–annealed	0·2654	0·2775	5·80
Mercury–pure	0·9564	1·0000	1·61

These results were found to vary according to temperature.

M. SORTAIS, in France, has invented an electrical device which is placed in the holds of vessels. In case of a leak or the entrance of too much water into the bilge, a current is established and a communicator is set in operation, signifying the fact to the commander and the officer of the deck.

ASPECTS OF INTERNATIONAL TELEGRAPHY DURING WAR TIME.

Though peace and war are obliged, for the sake of appearances, to sustain a sort of formal opposition to each other, they are, nevertheless, such excellent friends in reality that it is difficult to know how one could ever survive the other. War has afforded practice for doctors, has procured news for editors, has led to discoveries in nosology, has opened vast regions for commerce, and has furnished with facts and statistics airy speculators of all sorts. Peace, on the other hand, is always willing to see her inventions and discoveries adapted for purposes of destruction to human life. Her improved knowledge of ship building, of mechanics generally, of chemistry, of optics, are all at the service of war. But is her old friend as welcome to the last adaptation of one of her most vital discoveries—the electric telegraph? Peace will have to draw the line somewhere, and it looks as if it might be here. For while the construction of systems of telegraphy would be of the greatest use for warlike purposes, their destruction would be equally an object in the same cause; and such a policy as that would be so diametrically opposed to the interests of peace, as to make it imperative to consider the aspects of international telegraphy in time of war.

The telegraph, by land or sea, is *prima facie* one of the first considerations of either belligerent. To know the enemy's position, to ascertain its numerical force, to order arms and ammunition from remote emporiums, are all processes open to electric help. But then these wires measure tracts of territory—these cables stretch some thousand leagues; hence a hostile army on march or a cruising man-of-war can render the stations thus connected useless, just by severing the wires or cables at single points. Again, what havoc might ensue if one of the belligerents captured a telegraphic station belonging to the other side, and succeeded in keeping that fact to himself! The insight that might be obtained into the working of the opposite side, the misleading advice and false communications that could be sent, might turn the fortune of a war. This possibility would in itself be a source of danger, which, coupled with the necessary liability to destruction, goes far towards limiting the warlike advantages to be derived from the systems of telegraphy with which the world is enriched. Of course the extent to which the new apparatus might be employed by belligerents to further their conflict would be strictly confined to those wires and cables either under their complete control or possessed in common; but it is also evident that those systems shared by either belligerent with a neutral power would be in danger of destruction.

Consideration for the safety of such valuable property, and of such an indispensable accessory to our modern civilization, would induce neutral nations to be on the alert to save the telegraph, which is as remarkable for its precarious situation as for its invaluable use; and neutrals will have a clear right to insist on the preservation of their own cables or wires; but they can only demand that respect for property by observing certain conditions, which belligerents have an equal right to impose. The case when a neutral and a belligerent share cables or land telegraphs would be in itself a weighty subject for international legislation; for the facilities with which the position of the neutral might be turned to account are so obvious as only to increase the jealousy on all sides. By a pre-arranged understanding, cunningly adjusted trade communications, with a sober, business-like sound in their wording, might easily be made to convey important tidings or suggestions of tactics. The possibility of some such manœuvre would, of course, be felt by each belligerent, and would produce perpetual anxiety about the wires which cross its enemy's frontiers from a neutral state beyond, or about the cables which connect its shores with foreign coasts abroad; and that anxiety would create constant suspicion, and in many cases might induce actual attack. The "tone" of an impartial press, the attitude of a neutral Government, would be jealously watched by the belligerent who might not happen to share any overland wires or submarine cable with the non-belligerent State. Indeed, the tendency of the present day is to develop this jealousy of neutrals felt by belligerents, as witness the decision of the tribunal at Geneva. The opposite feeling existed in former days, when the increased demand for arms and ammunition caused by the declaration of war was looked upon by merchants of neutral States as a legitimate spur to certain branches of commerce. The increase in the difficulties inevitably following a declaration of war has doubtless contributed to bring about this reaction. For the same reason belligerents are more jealous of neutrals than they used to be. Again, owing to the development of telegraphy, all the nations are more in mutual contact. Each sees more of the game than used to be practicable; each is, in fact, more of a bystander, who could help either belligerent if so disposed. We have to take these things into account. Since nations now have this concrete tie of telegraphic machinery—representing in itself so much expenditure and profit, and forming a bond of union for which bygone days offer no precedent whatever—it behooves all the States concerned to devise some means for preserving the property, which no one Power can alone protect. Already we have the opinion of Sir James Anderson that no land telegraphs or cables need be destroyed during war time, all nations being sufficiently enlightened to "arrange conditions to control or suspend" them, as it may seem advisable, "without resorting to the barbarism of destroying them."

On the other hand, so long as neutrals observed the conditions imposed by the state of war, they would obviously retain the right not only to continue the ordinary traffic by cable or wire, but also to ally together for mutual protection of property in telegraphy by land or sea, and to send any trade messages, perhaps even into a belligerent country. Again, if a belligerent, in order to cripple her adversary, were to sever the wires or cable of a neutral, that neutral would in its turn have a distinct claim to regard the offending belligerent as having made war upon her, and to act accordingly. Peace must be considered before war, especially in such a case as the present. International telegraphy is a *sine qua non* of international commerce, and is a necessary means of social intercourse. But there is yet another cause it serves—it is the staunch friend of science. To cite a prominent instance, meteorology—a science long kept back for want of copious data obtained simultaneously from distant places—has recently taken a gigantic stride through the sole agency of telegraphy. In fact, we sum up the innumerable boons conferred upon us by the telegraph, when we say that it is the last and most effective addition to the machinery of progress; so much so, that if we might trust the sanguine, we might almost believe the epoch of war to have passed its meridian!

That happy time, however, has not yet been attained; and meanwhile we have other things to attend to which are at least as practical and more immediately urgent. A new kind of international property has sprung into existence, and it demands protection against its own special risks. It is therefore desirable that we should have rules and regulations for the protection of international telegraphy. The case is just one of those for the consideration of the Periodical Congress which the Emperor Napoleon suggested as a means of international legislation. But, in the meantime, governments and directors of private telegraphic companies should consider their position while they have yet time; for it would indeed be a matter for grave reproach were they to find themselves unprepared when they realize the emergencies which can be foreseen.—*Telegraphic Journal.*

FOUL AIR SIGNAL.

We abound in inventions to warn us of fire and to alarm the household at the approach of a burglar—but there is an insidious foe who enters everywhere, in every apartment of private houses, and riots unmolested in all public places, of whose presence we are not warned in time to make good our escape. We refer to bad air. It is perfectly notorious that no public or private buildings are adequately supplied with ventilation, and the consequences are more injurious than we are apt to believe. In default of suitable ventilation it would be well to have some kind of a signal to warn us of the danger, or a contrivance to automatically open the door or window. The presence of fire damp in the mines is made known by the explosion of the small volume of air in the Davy safety lamp. When this explosion takes place in the narrow compass of the wire gauze the miner knows that it is better to retreat until this dangerous gas can be blown out. Unfortunately the gases of close rooms are not of this explosive character; if they were, we should not suffer so much from bad ventilation as we now do, as no one would run the risk of being blown up for the pleasure of being suffocated. The gas which leaks through stoves and furnaces, and arises from imperfect combustion, known as carbonic oxide, can be absorbed in a way to betray its presence by the following ingenious invention: The apparatus consists of a small galvanic battery with a bell attached, and an open test tube containing liquid chloride of palladium. The chloride of palladium is extremely sensitive to the presence of carbonic acid gas; it absorbs the gas and precipitates metallic palladium; the deposition of the metal in the bottom of the tube makes the connection of the galvanic current, and at once rings the bell, which will not stop until the current is broken. The invention is found to work admirably for carbonic oxide gas, and the next thing is to devise a plan for disclosing the presence of carbonic acid gas. It is possible that this could be done by putting in a carefully counterpoised balance some caustic baryta of lime, which, by the absorption of the carbonic acid of the air, would sink and cause the current to be closed in the battery and the bell be rung. The same contrivance could be made to open and close a shutter, just as the draft of a stove is regulated by the rise of mercury in a thermometer connected with a battery. It would be a novel experience on any public occasion to have the proceedings interrupted by the ringing of bells until equilibrium was restored by proper ventilation. We should all take kindly to the interruption, and be thankful for a whiff of pure air. Let us by all means have a Palladium Ventilating Company organized, for the benefit of gasping humanity.—*Scientific American.*

He that has no resources of mind is more to be pitied than he who is in want of necessaries for the body.

CORRESPONDENCE.

To the Editor of the Journal of the Telegraph:

In regard to the adoption of the European alphabet, I think the majority, if not all, the operators, are opposed to it. Hoping that what I may say may help its destruction, I venture for the first time to trespass on your valuable space, for on so an important a matter as this I must do all I can for the right. The employés of this office are decidedly opposed to its adoption. We can't agree with you that the greater portion of errors are attributable to the spaced letters of the Morse alphabet, and contend that if those letters are properly made by the sender there's no excuse for the receiver making an error. The Morse alphabet cannot be improved upon. Compared with the European, it is shorter, less complicated, easier of transmission, and can be made in considerably less time. Some of the European letters are positively painful to make, while the numerals are even frightful to look at; a special wire will have to be provided to send the cyphers. You say that its adoption will be for the welfare of both the Company and its employees. I beg to differ with you; I think it would create the utmost confusion, and, pecuniarily, the Company would be very sorry for it. For the first six months of its use there would be no end of errors. Of course the most expert operators would readily acquire it, but that class are largely in the minority. When the Company take into consideration the amount of crude talent in the rural districts, they will realize the magnitude of the task before them. Why, the people of the United States might as well be told that, if after six months they were not prepared to speak "Greek," they should be prohibited from earning a living. The length of the letters will reduce the speed, thereby taking up more time, while the questions and amount of conversation in regard to it, over the wires, will, before it is thoroughly understood, cause confusion and delay; the responsibility and care of the operator will be increased. If the officers of the Company are in favor of it I am very sorry to hear it, and hope they will give the matter due consideration, inviting opinions from their employees before deciding on so important a matter; one which would result so disastrously to them, their employés and the public. The trouble is not with the Morse alphabet, but in the way it is mutilated by the senders, good senders being about as scarce as some receivers are when a lot of press, or a pile of messages are awaiting them. Every error that occurs (provided the receiver does not guess at, put in, or leave out a word, and there being no trouble on the wire), is the fault of the sender, the receiver to be competent, of course. The amount of it is this, that between competent operators there are no errors. Here are a few of the most common abuses of the Morse system: TH is transformed into an 8, MI into a 7, ME into G, AN into 1, six dots are made for a P, IN into Q, LS into B, and several others. Some of the above are under the writer's own observation, and occur daily. Another abuse is the way senders run their words together. One result of this is to get the letter S of the signature on to the last word of the message. For instance, if the last word is "Case," it is made "Cases." The dashed letters come in for space also; they are made sometimes as if the maker was afraid of them. There are cases which occur every day under our own observation where one operator writes the word "to" E. O., and another sends us messages from "Pimsburg." The word "am" and the name "Ham" is sent "all" and "hall," and *vice versa*. Some cyphers are a succession of T's. We think the sender should be equally if not more responsible for errors than the receiver.

A final word as to the styles of sending, and I will trespass on your valuable space no further. Some try to write so stylish (either with a clip or a drag) that it is imperfect. Others (and this is very common) try to write too fast, without regard to the result. I have seen operators (because a receiver happened to break a few times) deliberately write as bad as possible for the latter's benefit; others to gratify personal spite will try to drive a receiver off the wire by rushing him. Now this is all wrong; a man to thus "trifle" with the Company's business, and increase the liability to error on the part of the receiver, does not deserve a situation. It is also a question whether some operators don't send with their feet. Give me a man who always has a regular, steady, medium, plain style of sending, who, while endeavoring to send as plain as possible, also respects the rights and feelings of the receiver, and who takes every precaution to insure correctness and to guard against error. There is no occasion for breaking such a one, or asking what such and such a word is. Finally, I think the adoption of this European alphabet will create the utmost confusion, and I hope to hear from my fellow-sufferers on the subject.

REFORM.

GLEN COVE, March 28th, 1873.

To the Editor of the Journal of the Telegraph:

I noticed in your last issue an article in regard to the change of Alphabet, from our present one to the European, which may be well; my experience in telegraphing is too limited to give an opinion on the subject, but, as far as it has been looked into, it seems to me that the change would be desirable; but what I wish to give my humble opinion on, in the event of the adoption of the said (European) alphabet, is the manner in which the change should be made effective, and at the same time prevent difficulties that might arise by suddenly throwing upon operators the use of an alphabet, nearly one half of which is different—by transposition and otherwise.

The article I referred to is not before me, but if my memory serves me correctly, the writer, "H.," suggests that all operators ("Western Union") be directed to learn the new alphabet by the first day of January, 1874, and that it shall go into effect on that date, and all who may not have learned to use it shall be subject to 10 per cent. deduction of wages, each month thereafter, until they shall have accomplished it.

As to the per cent. deduction I have nothing to say; but I think the matter of securing the knowledge of the new alphabet to each operator could be accomplished, and with less liability to errors, &c., in this manner: for instance—say the European involves a change of twelve letters—let a month's notice be given to each operator, that on and after the first day of June, for instance, that the letters "C" and "J," according to the European alphabet, would be substituted for the same letters of the Morse alphabet now in use, and that on the first day of July the letters "F" and "Q" should be substituted, and so on until the whole number of letters and figures shall have been changed. My idea, though rudely expressed, I hope may be understood.

It seems to me that if the whole change is thrown at once on the army of operators, that it will not meet with the prompt success that would be effected by the gradual manner shown.

The art of operating is learned gradually. So should the learning of these new arrangements of sound be taught.

I admit that many operators might learn them all, in a few weeks; but, to take in view the many minds and again the difference of opportunity and application, it becomes another matter.

But where is the operator who could not get command of two letters per month, so that when the next month rolled around the two letters learned the past month would be so familiar to the ear as to leave the mind entirely free to grasp the next in order. Much more might be said, but I have already occupied too much of your valuable time.

W B. ROBINSON.

To the Editor of the Journal of the Telegraph:

Everything done which tends to simplify practice, to lesson error, to reduce exceptions, seems to me to be leading in the right direction.

To put the European alphabet into practice requires how much time?

Twenty-four hours is enough for any operator who can read readily by paper or by sound, and this includes all of us. In other words, there is not an operator in the employ of the W. U., or any railway company, who cannot make a success of the change in that time. The more expert the operator, the more messages he handles as a rule, and for him the change will be least perplexing. Those who handle but few messages will find plenty of time to correct, here and there, an error, by comparing with the European chart of characters. I say these things because I know them to be true.

In the early history of the JOURNAL, a number of operators at Cleveland, Ohio, learned, in a few minutes, an alphabet something like the European, and put it into practice with operators at Toledo and Detroit. After manipulating a few messages the old alphabet was not more thoroughly imbedded in the mind.

Were every operator furnished with a card alphabet on the first of June, with a notice that on the second of June, at a certain hour, the new characters would go into practice, they would be better prepared than if they were given one month, six weeks, or a year. This is reasonable. Such is human nature. And I will add, that if the cards be distributed on a certain day, with the notice as above, more time to learn the new will be taken, than if a month or more were first to elapse. We all know that any boy or girl of fourteen can learn the Morse characters in a day or a few days. In changing from the present to the new, we operators learn nothing. We only think a little, for we know what a dash is and what a dot is, and if we hear *ajjount* we know it is *account*, and if *Wizziam* it is *William*. I learned, practiced and transacted paid "biz" with the new alphabet, in half an hour after I got sight of it. Let's start in on the European to-morrow, or to-day.

To the Editor of the Journal of the Telegraph:

Evidently, the spaced letters, with *l* ——, are the only ones that need to be changed. I suggest that the characters now representing the first seven digits be used, in their order, in place of the objectionable letters. These characters being already learned, and coming in order in the alphabet, would become familiar to the ear sooner than new characters, while the figures, being used less often, could be represented by new characters to better advantage than the letters, which are used much more frequently.

The simplicity of our alphabet is its advantage. It would be impossible to make another so good. *C*, the first objectionable letter, being represented by 1; *l*, the second, by 2; *o*, the third, by 3, &c., would be very easily understood and put in practice, while an entirely new alphabet would be learned with more difficulty than we think, perhaps. N. W. O.

Digitized by Google

To the Editor of the Journal of the Telegraph:

Since my first communication relative to changing the alphabet, I have conversed with several experts, who object to the wholesale change. They say the object—getting rid of the spaced letters, and of *l* and the cypher—can be easily accomplished by changing those characters alone, and that there is really no advantage in having our alphabet like that of Europe. It is also suggested that one letter be changed at a time, to make transition easy. These opinions seem to be very general, and, as we can thus accomplish the main object sought, I acquiesce.

The strongest objection urged to the European alphabet is that many of their letters are ours, changed in name. Thus our J is made C; our Q, F; our X, L, &c., &c.

Adopting, then, the suggestions made, of changing the objectionable letters only, I submit the following:

Substitute two dashes for the space in C, thus: - - — — - and make R its reverse, - — — - -; make O, - — - - — -; Y, - - — - — - -; L, — — - —; Z, - - - — - -; &, - - — - - -; and Cypher, - — - - — -.

In changing these, I have made the C and R the reverse of each other, and the Z and character &, that the former relation of these letters to each other might be preserved.

How does this change meet the views of your readers? Let all speak. H.

Massachusetts, March 24th, 1873.

To the Editor of the Journal of the Telegraph:

If you will allow me space, I will say a word or two in defence of our old Morse alphabet, which some ambitious but possibly misguided operators seem to be anxious to exchange for the "European" or some other improved form.

I am one of the majority of American operators who think that Hamlet's remark,

> "Better bear the ills we have
> Than fly to others that we know not of,"

will apply to this case.

We can readily understand why it was more convenient, in using the European bell and needle telegraph, to adopt an alphabet which should be free from spaced letters. But with our "Morse" sounder in the hands of a competent operator, our short, spaced letters are much less objectionable than the longer combinations of the European alphabet.

In a communication of the last Journal it is assumed as a "well-known fact" that most of the errors in transmission in this country are the result of the use of spaced letters.

I cannot agree with this conclusion. I think the "well-known fact" is that at least three-quarters of the errors are chargeable to carelessness and poorly-written *originals*, or to the same defect in the copies taken at repeating offices. It is hardly fair to blame our alphabet for such errors.

Again: the vaunted "European" alphabet will not prove a great gain in reliability, if we may judge by "cable" business. I have had some experience on cable circuits, and all who have will admit that errors between New York and Plaister Cove, and New York and Duxbury, are almost unknown, while on the European lines and the cables they are quite frequent. Most of these are trivial errors, but errors nevertheless.

With regard to speed, I have been assured by well informed operators that the New York and Duxbury Circuit is able, in a pressure of business, to do enough in one hour of fast work to keep the St. Pierre cable busy three hours or more, even in good weather, when the short St. Pierre cable can be worked nearly as fast as a land line.

But the great and insurmountable obstacle to this sweeping change is the fact that it will prove impossible. Probably half the offices in this country are run in connection with some other business—railroad, express, post-office, or commercial business; and this class of operators have neither time nor inclination to learn and practice the new alphabet.

The proposed change could only be carried out on the strictly "commercial" and press circuits between the principal cities. The result of its adoption would be to make "plugs" of all our best operators for at least a year to come; to cause serious confusion and delay in the business, and consequently loss to those companies which might attempt to force the measure; and if the question of its adoption were submitted to vote, it would be rejected by nine-tenths of the operators of America.

The American alphabet has stood the test of thirty years' use, and has proved itself the most rapid and accurate system yet devised for practical use upon all kinds of work. As it seems to be distinctively an American institution, why change it merely to be in "European" style. If there must be a change, let us substitute new combinations for the spaced letters only, retaining the other letters as given us by our own Morse. I prefer the original.

Yankee Alphabet.

Washington, D. C., April 5, 1873.

To the Editor of the Journal of the Telegraph:

The question of a proposed change of alphabet having assumed so wide a range, and being seriously agitated in the Journal, I presume a few lines in opposition thereto will not be out of place. After carefully examining the so-called International Morse Alphabet, I am at a loss to see where any benefit can be derived therefrom by substituting it for the Morse. It seems to me a change would be disrespectful to the Father of the Telegraph, if this alphabet was substituted for the one of which he was the founder. Really I cannot see where it is even as good as the Morse. Having worked at the key steady for the past fifteen years, I have never experienced any difficulty in receiving Morse, except perhaps when I would occasionally get hold of a plug; and I claim to have done my share of telegraphing, it being no uncommon thing to sit from 8 A. M. till 5 P. M. without an opportunity to leave my instrument for a moment, in order to keep hooks clear. It also seems plain that any telegraph company in the United States that would adopt a new alphabet would be the losers thereby, because their good operators now would become inferior ones then, for a considerable time at least. The Morse system can certainly be manipulated faster than the International; and if we have "plugs" now, we will have them then. I quite agree with the writer of the Cleveland article, signed C. F. S., that the European alphabet has nothing to do with the one used in America. I think we Americans can paddle our own canoe. In conclusion, I trust this agitation of a change will cease, and that every operator in America who has a decent respect for the inventor of the electric telegraph, will cling to the American (Morse) system as the mariner clings to the ship when the night and the tempest close around him.

134.

S. L. Fetterman.—The Morse and Hughes instruments are used almost exclusively in Switzerland. We believe that no sounders are used. The alphabet is that combination of Morse signals, known as the International. The batteries are some form of the Voltaic pile.

Night Opr.—Anonymous communications are not inserted in the Journal.

Messenger.—The duties of a messenger in a country office, where only a small business is done, can hardly be defined specifically. If he is paid by the week or month, it would be within the line of his duty to sweep and dust out the office, light the fire in cold weather, and, perhaps, under supervision of the manager, keep the local batteries in order. In short he should make himself generally useful. A messenger is not responsible for the charges upon a message, if the party refuses to pay.

Miss S.—When a person sending a message desires the operator to insure an answer, the proper reply to be made would be that it is impossible, but that reasonable effort will be made to obtain one. The information contained in Rule 13 should also be imparted to the customer. In the event of no answer being returned, he would then, at trifling expense, receive all the satisfaction possible to be obtained.

Reader of the Journal.—The greatest number of words sent with a Morse instrument in one hour, of which we find record, is 2,631. This was done by Mr. E. M. Shape in February, 1868, sending from Milwaukee to St. Paul, a distance of 450 miles. In the same month Mr. R. J. Hutchinson sent from New York to Philadelphia 1,352 words in thirty minutes. Many operators have attained a higher speed than 2,500 words per hour. The highest rate per minute was probably achieved in these tests. The skill and ability displayed by the operators who received and copied the words sent at this unparalleled rate of speed is much more wonderful than that it was possible to transmit them.

Jersey.—The best way to clear a local zinc is to wash and brush it thoroughly in water. In offices where no messenger is employed, operators are expected to make diligent efforts to deliver messages; should it be impossible to deliver a message, the office at which the message originated should be immediately notified, giving the reason. Read Rule 58.

W.—In forwarding a message which had been received collect at your office, to another point by mail, without being directed to do so by proper authority, you imposed a grave responsibility upon the company, and rendered yourself personally liable for the charges upon the message. The proper course would have been to have notified the office where the message originated, and awaited instructions.

C. B. S.—Half-rate business cannot be received for any station not upon the Western Union lines, except such office is a half-rate office. The full tariff should be collected for this company as well as for the other.

Council Bluff's Office.—See reply to C. B. S.

Manager.—Every word contained in a message, except date, address, and signature (one), must be charged for. The words "Answer before four o'clock." "Answer, Globe Hotel," and everything of a similar nature should form part of the body of a message. When a message is signed, for instance, John Jones, for Singer Sewing Machine, the four words following the actual signature should be counted and charged for. Likewise, John Smith, per James Brown, three words. The decisions and instructions given in the Journal are by authority, and are to be observed as the law until countermanded.

C. P. McAllister.—There are thirteen words in: "I desire to meet you at the St. James, at nine thirty to-night." Rule 9 says: "Names of persons and places, where given to *things*, must be counted according to the number of distinct words in each."

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
April 15, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Hereafter the tariff for other lines from Columbus, Ga., to Union Springs, Ala., will be 65 and 4.
Marianna, Ark., closed.
Amity, Ind., closed.
Red River, Ind. Terr., changed to Colbert.
Tip Top, Iowa, changed to Arcadia.
De Soto, Kansas, re-opened.
Quitman, Miss., re-opened.
Griffin Crossing, Mo., changed to Griffin.
Neshanic, N. J., re-opened.
Alder Creek, N. Y., is now an other line office; tariff for other lines, 25 and 2 from Utica, N. Y.
The office at Pleasant Valley, Luzerne Co., Pa., will hereafter be checked direct.
Stewart's Station, Tenn., re-opened.

Business which has heretofore been sent via Marshall, Texas, to the following other line offices, may also be sent and checked to Sherman, Texas, at rates here given;

Bonham, Texas	35	2	510	Sherman, Texas.
Clarksville, Red River Co., Tex.	75	5	510	" "
DeKalb, Texas,	75	5	510	" "
Paris, "	50	3	510	" "

La Crosse, Wis., will hereafter be checked as an other line office; tariff 55 and 4 for other lines from Chicago for "offices having special sheet A," and as per tariff book for all others. The order in last JOURNAL making La Crosse a "check direct" office will therefore be disregarded.

NEW OFFICES.

294 Brock's Gap, Ala.
286 Deatsville, Ala.
294 Jemison, Ala.
25 Moosup, Conn.
327 Cruger, Ill.
327 Lawndale, Ill.

* Murphysboro, Ill.	35	3	329	Carbondale, Ill.
* Sand Ridge, Ill.	50	5	329	" "

ATLANTIC CABLE BUSINESS.

We are notified that messages intended to go to China and Japan by the Great Northern route, should in future be addressed *via Siberia*, instead of via Russia, as heretofore. The tariff remains unchanged.

CUBA CABLE BUSINESS.

We are notified that communication between Dominica and Martinique is restored. The tariff to Martinique, St. Lucia, St. Vincent, Grenada, Barbadoes, Trinidad, Demerara and Berbice, will be 50 cents less than that given in JOURNAL of February 15, 1873. The additional word rate will remain unchanged.

WILLIAM ORTON, President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, April 15th, 1873.

On and after May 1st, money order offices will be established at the following-named points in D. H. Bates' district:

G. H. MUMFORD, *Vice-Pres't.*

THE INTERNATIONAL OCEAN TELEGRAPH COMPANY.—ELECTION OF OFFICERS.—A special meeting of the International Ocean Telegraph Company was held at the office of the Company, No. 88 Liberty street, on Tuesday, April 1st. The Board of Directors was reconstructed, and the management of the Company transferred to the Western Union Company, which now holds the controling interest in the Company.

The following officers were elected in place of the former officials, who resigned in accordance with the arrangement made when the stock was sold to the Western Union Company:

William Orton, President; Norvin Green, Vice-President; George H. Mumford, Secretary.

Directors—Messrs. Wm. Orton, Norvin Green, Cambridge Livingston, Augustus Schell, George H. Mumford, Wm. F. Smith, Horace F. Clark, Alonzo B. Cornell and E. S. Sandford.

THE BROKEN ATLANTIC CABLE.—The test made by Mr. Willoughby Smith, the electrician of the Anglo-American Telegraph Company, at Valentia, locates the fault at 568 miles from Valentia. The Admiralty chart shows a depth of 1,875 fathoms of water at this point. Arrangements will be made to pick up and repair the cable during the present season.

THE operators employed on the line of the Consolidated European and North American Railway are arranging to meet at a dinner, to be given by themselves, at Vanceboro, Me., the object being to bring all the operators on the line together, so that they may become personally acquainted. A Committee of Management has been appointed, which has received the sanction of the Superintendent to proceed with the affair. No doubt it will result satisfactorily.

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS 39, 40 AND 41, UP TO APRIL 10TH.

The acknowledgment of receipt of any assessment is to be understood as an acknowledgment for all previous assessments.

ASSESSMENT 40.

941.

Notwithstanding the frequency of deaths during the past few months, making a corresponding number of assessments necessary, our Association continues to increase in membership and efficiency.

On the second of the current month there were (including those who have recently joined) 1,278 members in good standing; and although at every assessment a greater or less number drop out by reason of failure to respond, our progress has been steadily onward, and the payments we have been able to make have been greater each successive time.

The following is a statement of the returns to the double assessment of February 1st, 1873:

Paid in to the credit of	Assessment No. 37	$1,117 00
do.	do. 38	1,128 00

A small manual, giving a short history of the Association, general rules of the Executive Committee governing its operation, articles of association, mortuary list, etc., has just been issued and can be had on application to the Secretary. A supply will shortly be sent to the agents, from whom copies may also be obtained.

NEW YORK, April 7, 1873.

To the Editor of the Journal of the Telegraph:

I notice in your answer to Operator K, in your issue of April 1, you state, "There is always a consumption of material going on in a battery." I beg leave to state that this is not the case in the Leclanche Battery, as there is no waste at all when the battery is not in use. As this battery is being introduced extensively in this country, it is but fair to have the above fact known.

HILBORNE L. ROOSEVELT.

FOREIGN TELEGRAPHIC ITEMS

THE NEW CABLE OF THE FRENCH ATLANTIC CABLE COMPANY.

The *Great Eastern*, lying in the Medway, has received on board the whole of the deep-sea section of the new Atlantic cable. Already there have been four cables laid, three of them being in successful operation at this moment. The first, laid and broken in 1865, picked up and completed in 1866; and the second, laid in 1866, from Valentia, in Kerry, to Newfoundland, belong to the Atlantic Telegraph Company and to the Anglo-American Telegraph Company. The third, laid in 1868, from Brest to New York, belongs to the Société du Cable Transatlantique Français. The new cable is the property of the same company, and it is intended to lay it in May and June, the ship being appointed to leave her moorings on the 10th of May. It is remarkable that the wires of this new cable, which is nominally the property of a French company, will both leave and enter British soil. If the Telegraph Construction and Maintenance Company will only keep to themselves the course of the ship during the laying, and the bearings of the cable, this new cable will give us, in case of war, a direct communication with Canada, independent of the land lines of Newfoundland, which, in Winter, are more or less liable to interruption, and of the wires crossing the wildest part of the west of Ireland, where at such a time the disaffected might take a fancy to injure them. The point of departure is a place called Germoe, on the north side of Mount's Bay, Cornwall, and the cable will be landed at Freshwater Cove, in Halifax harbor, on a piece of land in the occupation of the War Office, by which leave to use the cove has been granted. There will then be laid a branch cable from Freshwater Cove to Hog Island, near the end of Long Island, and only fifteen miles from Sandy Hook, nor much more from Brooklyn. The new cable differs somewhat from any of those hitherto laid, either to America or elsewhere. There are seven No. 18-gauge copper wires, twisted in a spiral, weighing 300 lb. per nautical mile, and these are covered with four coats of gutta percha, with thin layers of Chatterton's compound, this amounting to 400 lb. per knot. The diameter of each wire is ·0048 inch; of the strand, ·0146 inch; and of the wire and gutta percha and compound, ·0464 inch. This core is served with hemp, and the hemp is again protected by ten wires drawn from homogeneous iron, each wire being swathed in five yarns of Manilla hemp laid on spirally, with a tarry compound to preserve it. The cable weighs nearly two cwt. per knot more than the previous cables; but it is even stronger in proportion, and is calculated to last at least twice as long under the same conditions.

THE ATLANTIC SUBMARINE CABLE MONOPOLY AND COMPETITION.—The existing Atlantic Telegraph Companies will shortly have four lines between Europe and America, gaining about £688,000 of gross receipts at a cost of 10 per cent. for working, and enabling them to divide £340,000 among their shareholders, after making large additions to their reserves. This success has, doubtless, led to the formation of a new company, whose prospectus is just issued, although four lines are more than enough to do the work. When the fifth line is laid the least of the mischiefs which will result will be that the £340,000 of net earnings will have to be divided between about five millions instead of four millions of capital, reducing the dividends of the old lines by one-fifth. This will be the effect on the shareholding interest if the new company succeeds. And the effect of its success on the public will be that the lost one-fifth of the dividend will require to be made up, for both the old and the new capital, before the aggregate companies will be in the position that the existing companies are in at present for conceding a reduction of tariffs.

OFFICIAL ESTIMATE OF THE BRITISH POSTAL TELEGRAPH FOR 1873–74.

The official estimate for the telegraph service in the financial year 1873–74 puts the probable revenue at £1,220,000, and the working expenses and maintenance at £815,000, leaving a surplus of £405,000. The wires used for public messages alone, exclusive of those which belong to the railway companies, and are used principally for railway, and secondarily for public purposes, form a system of 100,098 miles. and the wires leased by the department to private firms or individuals for the transmission of messages on their own business between offices and factories. make a system of 5,187 miles. The total is 105,285 miles, and this mileage of wire serves 3,640 postal telegraph offices, and 1,097 renters of private wires. There are 435 of these renters in the metropolitan division—202 in the north-western, 183 in the northern, 46 in the north-eastern, 33 in the southern, 6 in the eastern; 154 in Scotland, 38 in Ireland. The pneumatic tubes worked in London extend through a length of 12,800 yards; in provincial towns, 8,069 yards—namely, 2,700 in Dublin, 2,403 in Liverpool, 2,026 in Manchester, 698 in Birmingham, 242 in Glasgow. The estimate provides for upwards of 6,000 telegraph messengers.

THE recent depression in Newfoundland Telegraph shares appears to have arisen from the fact that the Newfoundland Government has reserved the right to purchase the lines at a valuation in the year 1874. But as the company is earning about fifteen per cent. per annum, twenty years' purchase would give a handsome return to the present shareholders, apart from their land rights, estimated to be worth £4 per share.

THE Board of the Anglo-American Telegraph Company have resolved to pay the usual interim dividend of two per cent. on the 1st of May next for the quarter ending the 31st of March.

THE German Chancellor demands 4,000,000 thalers of the French indemnity for strategical and administrative telegraphs.

Committees of the Anglo-American Telegraph Company, the Société du Cable Transatlantique and the New York, Newfoundland and London Telegraph Companies have agreed upon an immediate amalgamation of those lines, subject to ratification by the Boards of Directors of each Company.

RESOLUTIONS have been passed by the Boards of the British Indian Extension, China Submarine, and the British Australian Telegraph Companies, agreeing, subject to the assent of the shareholders, to amalgamate their several undertakings on the basis of an allotment of shares in the amalgamated company as follows:—British Indian Extension, £15 per share; China Submarine, £11 per share; British Australian, £11 per share.

IN PERU, Henry Meiggs, the Railway King, is substituting telegraph instruments of American style in place of English, which, heretofore, have been exclusively used.

IT IS reported that the directors of the Panama and South Pacific Telegraph Company are of opinion that the present contract ought to be canceled, the deposit of 40,000*l.* returned, and other matters in dispute arranged, and (if necessary) a new contract entered into either with the present contractors or some other construction company.

INDO-EUROPEAN TELEGRAPH.

The report states that the receipts for the year 1872, amounted to £37,079, as compared with £48,949 in 1871—showing a falling off of £11,870. The £37,079 included £12,000 claimed by the Post-office, and disputed by the company. The expenditure on commercial account, amounted in twelve months, to £13,789, as against £14,601 for the year 1871—showing a reduction of £812. The balance on revenue account, after charging the £12,000 for the disputed item, amounted to £11,315. Of this sum £2,676 had to be set aside to the liquidation of the Persian debt account. The contractor's account for maintenance, for the year ending September 30 last, amounted to £22,972, and therefore, under the arrangement made in July, 1870, the balance of £8,528, together with the amount credited this year to the liquidation of the Persian debt, and any portion of the £12,000 which might be recovered from the Post office, would be accepted by them in full settlement of their claim. The diminution in the receipts of the company, was to be ascribed to the interruptions sustained over the entire line, between London and Kurrachee during 1872, and to the reduction of tariffs, which came into operation last July. The interruptions on the company's section of the through line showed an improvement of 45 per cent. upon those sustained during the year 1871. Unfortunately however, the interruptions on the section of the line between Teheran and Kurrachee, more than neutralized the improvement on the company's section. The long duration of those latter, was in great part owing to the disturbed state of Persia, consequent upon the fearful famine and distress in 1872. The country was now, happily, nearly restored to its former condition, and was rapidly improving. For the current year, up to the date of this report, the receipts exhibited an increase of 50 per cent., and for February, of upwards of 60 per cent. on those of 1872. In order to neutralize the effect of packing, and to afford additional facilities to the public, the directors had formally proposed to the Indian Government, that a word tariff, beginning with ten words, at half the present rate for twenty words, should be introduced as speedily as possible—any number of words above ten to be charged at 4s. per word, being in the same proportion. It was proposed to extend the same measure to Batavia, Australia, China, and the Straits Settlements. The balance sheet showed that £420,713 had been expended on the construction of the line.

THE River Plate Telegraph Company's cable between Montevideo and Buenos Ayres has been successfully laid.

SENOR ENRIQUEZ LEFEVRE of Panama is in Mexico to complete a contract for telegraph lines between Tehuantepec and Oaxaca, a distance of 85 leagues.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended March 15th was 312,147—an increase on the corresponding week of last year of 59,715.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom, for the week ended March 22, 1873, was 305,508—an increase on the corresponding week of last year of 31,865.

NEW CABLE BETWEEN JAMAICA AND COLON.—The West India and Panama Telegraph Company has contracted with the Telegraph Maintenance Company to lay a new cable between Jamaica and Colon, and to repair the others. Sir Charles Bright and the India Rubber Company have notified that this independent movement in no way relieves the original contractors, or prejudices the claims of the Company for compensation for their many breaches of contract.—*Panama Star and Herald.*

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, APRIL 15, 1873.

COURTEOUS RECEPTION IN ENGLAND OF THE WESTERN UNION COMMISSION.

In letters received from Messrs. Prescott and Eckert, now in Europe, mention is made of the kindness and courtesy with which they have been received by all classes of the telegraphers in England. Every facility has been afforded them to examine into the working of the British system, and in this way a great mass of information has been acquired, which will be made available to our own service upon their return. Mr. Scudamore, the Director of Postal Telegraphs in Great Britain, detailed Mr. Culley, Engineer-in-Chief, to accompany Messrs. Prescott and Eckert in their tour of inspection, and, conducted by that gentleman, they visited most of the principal telegraphic points in England and Scotland.

At the present writing the Commissioners are visiting the telegraphic centres on the Continent.

General Eckert is expected home about the 1st of May, while Mr. Prescott will remain to attend the Vienna Exposition.

A WORD TO OUR CORRESPONDENTS.

We surrender in this, as in former issues of the JOURNAL, considerable space to correspondents, who desire to express their views on the proposed change of alphabet, by the substitution of other characters for the spaced letters. A large number of communications which have been received upon this subject, throw but little light upon the matter, but exhibit a considerable amount of prejudice. It should be remembered that a change in the alphabet will take place only for good and sufficient cause. Make your comunications short and to the point. Bear in mind that space in a newspaper is valuable, and that life is short.

OWING to typographical and other errors, the notice to managers regarding business done under "Red" Franks, which appeared in the last JOURNAL, was incorrect. The following is the correct version of the order:

Managers of offices in returning, with their Monthly (No. 4) report, the business done under "Red" Franks, should enter such on a separate blank from other half-rate messages, or press, and indorse the statements "Refunded under Executive Order No. 143." All such messages should bear upon their face the amount of tolls at full rates, and the number of Frank on account of which one-half of the (full) tolls is refunded.

HOW THE BRITISH POSTAL TELEGRAPH SERVICE IS MADE TO SHOW A PROFIT.

The outlook of the British Postal Telegraph does not brighten. In fact their wonderful success, pecuniarily, *vide* Scudamore, Creswell, Sauer, Lines, Hubbard, &c., is only apparent in the able manner in which the public has been deceived, and public money expended. Since the government has controlled the lines, nearly sixteen million dollars have been added to the capital account, and the end is not yet. Expenditures in excess of receipts has been going on at the rate of over three millions per year, the deficiency being placed to account of capital. To avoid unpleasant and embarrassing enquiries, during the past two years trust funds in the hands of the government have been diverted ("misappropriated" is the term used) to cover expenses for extensions and improvement of the lines, in the probable view that such appropriation would, when brought to light, be legalized, that the step having been taken, the government could not recede. The true state of affairs has been recently exposed by a committee of the House of Commons, and a further investigation, which has been recommended, will doubtless be made.

Perhaps Mr. Creswell will incorporate these facts into his next annual report, in support of his scheme, while Messrs. Hubbard and Ramsey will use them to intensify their patriotic appeals for the privilege of putting public money into private pockets. The figures of this small expenditure for extensions and improvements may also be useful to the "estimate man."

MANY of our readers will probably recollect the amusing case of an individual who joined the Telegraph Life Association in the early part of its history, and who, after paying two or three assessments, sent in his withdrawal on the ground that he "did not receive any benefit from the Association, and saw no reason why he should pay out his money for it." His case is somewhat eclipsed by a philanthropic gentleman in Iowa, concerning whom an agent writes: He paid his dollar and a half for a certificate of membership in the Association, because the "small-pox was epidemic in his place." His great soul was in fear. His life was jeopardized. In time a member died, a dollar was called for, our friend failed to respond. The agent wrote, reminding him of his duty. The response came that "the epidemic had subsided," and he declined to pay.

ADVANTAGE is to be taken of the gathering of men of science of all nations during the International Exhibition at Vienna to convene a congress on the question of patent rights. It will meet on the 4th of August, and will be composed of manufacturers, scientific men, political economists, and skilled workmen.

PROGRESS OF THE ELECTRIC TELEGRAPH IN AMERICA SINCE 1866.

The year 1866 marks an epoch in the history of the telegraph in America, hardly second to that of the introduction of this means of communication. The advance in electric science, more particularly in its bearings upon the art of telegraphy, is a subject of wonder and admiration. The assertion is safe, that more real progress has been made within the past seven years than in the whole twenty-five years preceding. The laws which govern the electric current, if current it may be called, have become familiar as household words in our ears. New projects in telegraphy are of almost daily announcement. Theories, many of them possessing novelty, and some few, merit, are continually being advanced. Electricity, in all its branches, has become the foremost science of the day.

In recording the progress of the telegraph in America, in these latter days, we shall speak more particularly of the Western Union system, under which comprehensive summary is embraced the lines of the Western Union Telegraph Company, and those of the companies with whom they connect. That this is the proper course for us to pursue will be evident from the fact that this system comprises at least nine-tenths of all the lines upon the North American Continent, and as, from the want probably of ability rather than from a lack of enterprise, the lines operated outside of this system are unable to do other than to follow in the course of the Western Union Company, the assumption that the progress of this Company represents the entire history of the progress of the telegraph, will not, probably, be brought into question.

In the United States, at, and shortly after, the time of the consolidation of the three great companies, referred to in our last article, there existed, outside of those consolidating the following lines:

Banker's and Broker's Telegraph Company, lines extending from New York to Washington; Pacific and Atlantic Telegraph Company, lines completed from Philadelphia to Pittsburg and Cincinnati, and extending; Franklin Telegraph Company, lines extending from Boston to Washington; International Telegraph Company, lines completed from Boston to Bangor, Me.; Keystone Telegraph Company, lines extending from Philadelphia to Harrisburg and Pittsburg; International Ocean Telegraph Company, lines extending from Lake City to Key West and Havana; Northern Telegraph Company, lines completed from Boston to Bristol, N. H., and extending; Atlantic and Pacific Telegraph Company, lines completed from New York to Chicago, and extending; Great Western Telegraph Company, line completed between Chicago and Milwaukee; Northwestern Telegraph Company, lines extending from Milwaukee through Wisconsin, Michigan, Iowa, and Minnesota; Mississippi Valley Telegraph Company, lines extending between St. Paul, Minn., and St. Louis, and from Dubuque to Chicago; California State Telegraph Company; Illinois and Mississippi Telegraph Company, and the Chicago and Mississippi Telegraph Company.

There were, in addition to this list, quite a large number of Companies, covering more or less territory, which, with all of the above mentioned, were independent organizations, and nearly all of them engaged in competition with each other.

In the British Provinces, there were the Montreal Telegraph Company, lines covering Upper and Lower Canada, and the New York, Newfoundland and London Telegraph Company, lines extending from Plaister Cove, Cape Breton and Heart's Content.

Digitized by Google

In 1868, the Dominion Company, with lines extending over a portion of the Dominion of Canada, was organized, and in 1872, the Southern and Atlantic Telegraph Company, with lines from Washington, D. C., to Montgomery, Ala., commenced to operate.

Of these, the Bankers' and Brokers', Northern, International, California State, Illinois and Mississippi, and Chicago and Mississippi Companies have been absorbed by the Western Union Company, and a controlling interest in the management of a portion of the remainder has been acquired. During all of this time, the wires of this Company, in addition to the acquisitions above mentioned, have been carried by various new routes many thousands of miles, while nearly every mile of their old systems has undergone reconstruction.

Among the more important lines which were thus rebuilt, is that extending from Omaha to San Francisco. This line was originally constructed in 1862, along the emigrant route *via* Forts Kearney and Laramie, crossing the Rocky Mountains at the South Pass, and thence, *via* Salt Lake City, Forts Crittenden and Churchill, across the Sierra Nevada Mountains to Placerville, Sacramento, and San Francisco.

When this line was first operated, very little annoyance was experienced from the Indians, but subsequently, when they ascertained that it communicated, by some mysterious agency, with the soldiers, they took every opportunity to destroy it. This unfortunate change in their disposition rendered the situation of the operators—stationed in many cases miles from human habitation—extremely hazardous, and some of the stations were necessarily abandoned.

The opening of the Pacific railroads fortunately remedied these grave difficulties, and the lines were at once transferred from the old route to the railroads. New lines have since been completed over the entire length of the Pacific roads, from Omaha, Nebraska, to San Francisco, California.

The territory now occupied by the lines of this company embraces almost the entire civilized portion of the continent of North America. On the eastern coast their lines extend from Plaister Cove, on the Gulf of the St. Lawrence, to Brownsville on the Rio Grande, and on the western coast from San Diego, California, to the fisheries on the Kishyox river, eight hundred miles north of New Westminster, British Columbia. They reach across the continent, from the Atlantic to the Pacific Ocean, and embrace every State and Territory in the Union but Minnesota, New Mexico and Arizona, and include the British Provinces of Nova Scotia and New Brunswick.

On the 1st day of July, 1872, the Western Union Company controlled and operated 62,032 miles of line, 137,190 miles of wire, and 5,237 offices or stations. Of this aggregate, 1,212 miles of line and 2,742 miles of wire were in New Brunswick and Nova Scotia, and 512 miles of line, bearing one wire, in British Columbia; leaving 60,308 miles of line, and 133,936 miles of wire in the United States. Since then nearly 20,000 additional miles of wire has been strung and about 300 new offices opened.

The telegraphic facilities of the United States have been increased within less than six years past by the construction of thirty thousand miles of line and seventy thousand miles of wire, and the opening of more than three thousand new stations. Of this development the Western Union Company has provided more than half, and has expended therefor about five million dollars, in addition to the contributions of Railway Companies included in its system, which amount to two and a half million dollars more. Probably, the gross expenditure for new telegraphic property by all the companies in the country, including railways, has amounted to nearly or quite twelve millions of dollars within these six years. During this period the average charge for messages has been reduced one half, and work has been in progress for some time by the Western Union Company preparatory to further reductions, which will be made at an early day.

The nominal capital of the Western Union is $41,000,000, and its gross receipts for the year ending June 30, 1872, were $8,457,095.77.

Of the companies competing with the Western Union the following are the most important:

First. The Pacific and Atlantic, with 5,000 miles of line, and 10,000 miles of wire, extending from New York to St. Paul and St. Louis by Chicago, and to New Orleans by Cincinnati and Memphis.

Second. The Atlantic and Pacific, in connection with the telegraph of the Union Pacific Railroad, 4,500 miles of line, and 9,000 miles of wire.

Third. The Southern and Atlantic, extending from Washington, along the line of the coast, to Charleston, S. C., thence to Montgomery, Alabama.

Fourth. The Franklin, extending from Washington to Boston, 800 miles of line; 2,780 miles of wire.

Fifth. The Great Western, with headquarters at Chicago.

Sixth. The Philadelphia, Reading and Pottsville, owned and operated by the Philadelphia and Reading Railroad.

These companies have about 800 stations, and operate an aggregate mileage of 13,000 miles of wire, with 27,000 miles of wire. Their nominal capital is estimated at $16,000,000.

For the 1st of January, 1873, the telegraphic system of the United States may be thus approximately estimated:

Aggregate nominal capital, $60,000,000; length of lines, 80,000 miles; length of wire, 180,000 miles; number of stations, 6,300.

There are several important offshoots, which are not enumerated in the above summary, as, although to all intent and purpose they are lines of telegraph, yet in their aims and results they are so far removed from what is ordinarily understood to be the business of the telegraph, that they properly constitute and occupy an independent position. The most prominent among these are the Gold and Stock Telegraph Company, and the American District Telegraph Company. The first named company embraces in its operations many of the most important cities in the country, connection being had, each with the others, t rough the commercial lines of the Western Union Company. In New York City upwards of 1000 separate offices are operated, which receive uninterrupted messages during business hours relative to prices and sales, the telegraph company furnishing the operators and the instruments, and the officers of the "Stock Exhange" the information.

The latter confine their operations to furnishing messengers for service, calling policemen, and extinguishing fires for their patrons. They place instruments in any office or private house, and connect them with some one of their stations, charging a certain sum per week for the use thereof, and an extra sum in proportion to the service rendered upon a call. The machinery used by these companies is adapted to their peculiar requirements.

Any review of the experience of the telegraph in the United States would be imperfect, which omitted to call attention to the circumstance that it stands before the people of the United States as the product of private enterprise, and is not the debtor of the Government for a single dollar. Congress has given hundreds of millions for other enterprises—hundreds of millions in bonds and lands to railways, and so far as we know, not a single Telegraph Company in the United States is to-day the recipient, direcly or indirectly, of one single dollar of benefit conferred by the Federal Government.

Its development has fairly kept pace with the growth of the country, without having cost the Government a dollar, while in Europe, under Government control, the annual deficit, provided by taxation, has been several millions.

Private enterprise has already established the telegraph throughout every State in the Union, and in all the Territories but one (Arizona). The value of the services it has rendered, without charge, in the interest of science, and to sufferers by fire, and flood, and pestilence, is far beyond that of all the pecuniary contributions it has received. Millions of acres of the public domain have been granted to railway corporations, while the telegraph has received no grants of land except whereon to plant its poles.

A LESSON IN GOVERNMENT TELEGRAPHY.

The advocates of the postal telegraph system make it one of their standing arguments that the British telegraphs are yielding a handsome profit to the Post-office Department, after paying the interest on the capital invested. We have never been able to get any positive evidence in support of this assertion; on the contrary, we have had good reason to disbelieve it; and now here comes a "financial scandal," disturbing the House of Commons, and scattering all the calculations of profit to the winds. It has been discovered that the telegraph authorities have been in the habit of appropriating for the expenses of the service, not only a large surplus belonging to the post-office, but a considerable amount of savings bank deposits, a proceeding which a Parliamentary Committee, charged with an investigation of the matter, mildly characterizes as "misappropriation of a peculiarly serious character. "Last year a deceptive return of the financial transactions of the telegraph service was made, by transferring to the capital account £645,000, properly chargeable to current expenses. Parliament, nevertheless, granted an additional £1,000,000 of capital, and it appears that Mr. Scudamore, after spending all this as well as all the gross receipts of the traffic, has already drawn upon outside sources for a deficiency of £656,000, which will be increased to £800,000 by the end of the financial year.

This unwarrantable use of trust funds has caused considerable excitement in England; but the case interests us in the United States chiefly because it shows the fallacy of the idea that the Government can manage the lines with profit to itself or to the people. We were told that a postal telegraph would give cheap rates and efficient service, without cost to the tax-payers. The system has been four years in operation—long enough certainly to give it a fair trial—and this is the result.—*N. Y. Tribune.*

Telegraphica is the title of a spicy sheet edited and published by Mr. Walter P. Phillips, an erratic genius, with an overwhelming propensity for fun, which is constantly breaking out in new spots. "Laugh and grow fat" is an old saying, and, if true, five cents invested in *Telegraphica* will go further in developing adiposity than double that sum in roast beef.

Mr. Phillips is a well and favorably known telegrapher, and is now engaged in the General Office of the Western Union Company, No. 145 Broadway.

REPORT OF THE COMMITTEE OF THE HOUSE OF COMMONS UPON THE POSTAL TELEGRAPH SERVICE.

The Commons Committee of Public Accounts, nominated on the 7th of February, 1873, and which consists of Messrs. Baxter, Sclater-Booth, Seely, Liddell, Algernon Egerton, Goldney, Candlish, Crawford, Rylands, Lord Eustace Cecil, and Mr. O'Reilly, have presented their first Report. The following are their remarks on "Vote 5—Telegraph Service:"

"Your Committee reported last year that the accounts under this head had been much disturbed by their incomplete condition as to separation of capital from current expenditure, and they were then informed that a statement of capital expenditure was in course of preparation, and would be laid before Parliament during the Session of 1872.

"To the accounts now before them the same observations apply, and the Committee are again informed by Mr. Scudamore that the statement is still incomplete, that he hopes shortly to be able to show all that has been done down to the close of February, and that it may be possible to close the capital account on the 31st of March next, except with reference to certain payments to railway companies.

"With regard to the working expenses of the year, it has been impossible to examine and report upon them in a proper manner. The vote was taken in one sum, and no details were given; while the scale of salaries and allowances, when approved by the Treasury, was not furnished to the Audit Office in time to enable the payments charged in the present account to be compared with it.

"With reference to the important point raised in the fourth paragraph of the Controller and Auditor-General's report as to the 'audit of authority,' Mr. Scudamore admits that regulations must be laid down defining what portion of the expenditure, both in kind and in amount, may be undertaken by the Postmaster-General on his own responsibility, and what will require the sanction of the Treasury.

"The Committee trust that immediate steps will be taken to frame and issue these regulations, apart from which, and from the scale of salaries above mentioned, the operations of the Controller and Auditor-General have hitherto been rendered to a great degree futile, if not illusory.

"The Controller and Auditor-General observes, in his fifth paragraph:

"'That transfers of 644,936*l.* have been made from the Telegraph Vote to capital account; that by this means the department has escaped the necessity of submitting estimates for extensions and improvements, and the control of Parliament has been avoided, though an *ex post facto* authority may be said to have been given by the Act subsequently passed granting an additional million on capital account (Telegraph Act, 1871), and that this proceeding has only been effected by applying Post Office revenue to services which should have been otherwise provided for.'

"The Committee having made inquiry of Mr. Scudamore on this point, it appears from his replies that the proceeding thus commented upon with respect to previous transactions has been repeated during the last 12 months, and that the whole of the additional million of capital granted in 1871, having been spent, the department, instead of applying to Parliament for a further grant, has continued its payments for extensions, &c., defraying the cost out of the balances in the hands of the Postmaster-General; that 656,000*l.* had been thus spent up to the end of November, 1872, and that a sum not far short of 800,000*l.* will have been so expended before the end of the current financial year, and that a large proportion of this has been derived from savings-bank deposits.

"Your Committee do not hesitate to express the opinion that this wholesale expenditure out of the balances, in anticipation of the vote, is in the highest degree irregular and objectionable, and appears to be in conflict with the provisions of the Telegraph and Savings-Bank Acts; nor can they admit the plea of urgency, seeing that four years have now elapsed since the telegraph service was taken over by the Government; but further and still more important considerations arise, to which, though less directly within their functions, they desire to call the attention of the House of Commons:

"1. Under the present system the Post Office would appear to have the uncontrolled power of dealing with balances to the extent, probably of a million in excess of its legitimate requirements.

"So far as those balances consist of savings bank deposits, such dealings must be held to amount to misappropriation of a peculiarly serious character.

"3. If, as is understood, the National Debt Commissioners are constantly kept informed of the sums due to them, some strange defect of power or activity would seem to have interfered with their obvious duty of calling for the balances with a view to investment.

"4. The check of the Audit Office, which is also supplied with monthly statements of receipt by the Postmaster-General, must be imperfect, if not altogether nugatory.

"5. The position of the Postmaster-General is compromised if the secretary in his office can carry on such enormus operations by means of moneys for which he, as chief, is liable to account to the public.

"6. Finally, what becomes of the control of the Treasury over a Revenue Department, for the due and regular conduct of which it is in the highest degree responsible if such things can happen, not once, but repeatedly, and if the abstraction of such enormous sums from their legitimate destination can continue to be unnoticed throughout the whole of a financial year, even up to the time when the statement of the year's income is formally submitted to the public? The Treasury state that they had no knowledge that the authorized capital had been exceeded, but it must be observed that the evidence taken by your Committee last year brought out the fact that such would inevitably be the case, while it was known to them that similar, though less extensive transactions were covered by the grant of the additional million in 1871. (See letter of Mr. Scudamore to the Chancellor of the Exchequer, Parliamentary Paper, No. 378—1871, page 4.)

"Your Committee have not thought it incumbent on them to pursue these investigations at present. Considering the relations in which the Post Office stands to the Treasury, it is, they think, the duty of the latter department forthwith to institute a complete and searching inquiry. It seems indispensable that the House should be informed, before the Post Office Estimates for the current year are voted, how such things have been possible in the past, and what steps are proposed to make them impossible hereafter.

"They accordingly recommend that the Treasury should lay before them a full statement of their proceedings in this matter, which they propose to submit for the consideration of the House in a future Report.

"The Controller and Auditor-General calls special attention to the fact that the whole expenditure for materials has been transferred to capital. Mr. Scudamore in answer to question 521, explains that the amount of materials legitimately to be borne by revenue has, as yet, been extremely small, but hereafter the case will be very different.

"The Controller and Auditor-General proposes to disallow the transfer of 40,157*l.* 13s. 10d. from the vote to capital in respect of 'way leaves,' &c. It appears that this service is very imperfectly thus described, and that the true heading should have been 'compensation to railway companies for surrender of their revisionary interests in telegraph business, including way leaves.' Your Committee agree to this proposal, and in the other corrections which have been made in the account by the Auditor.

"The net deficit to be voted will accordingly be 171,775*l.* 18s. The amount of this deficit is owing to the great, rapid, and unforeseen extension of the telegraph business during the past year."

DEATH OF M. CHARLES LENDI.

The *Journal Telegraphique* contains an obituary notice on the late M. Lendi, Chief of the Swiss telegraphic system, and Director of the International Bureau of Telegraphic Administration at Berne. M. Lendi was a gentleman of the highest character and of considerable ability. In his death, which occurred January 12, 1873, the telegraphic service of Switzerland has sustained a loss that will not be readily repaired. We condense:

"M. Lendi, although of Swiss descent, was born in Paris, in 1825. His father removed to Lucerne at the time of the Revolution in 1830, and it was in the schools of the latter city that he received his education. When seventeen years of age he entered the military service and served for several years with distinction. When the telegraph was first introduced into Switzerland, M. Lendi found in its service a congenial field for his activity and intelligence, and accordingly entered it. In a few months he was appointed chief of service at Schuytz, and subsequently at Lucerne. The following year he was employed by the Government of Piedmont to set up the Morse apparatus and instruct the employés in the use of that system, then first introduced into Italy. In 1857 he was appointed Inspector of the Lausanne Telegraph District, which position he filled until 1864, when he was made assistant director of the Swiss telegraphic system. In 1869 he was promoted to the position of director-in-chief, which he occupied at the time of his decease. In the latter part of 1869, the directorship of the International Bureau being vacant, he consented to fill it temporarily, and, as representative of the Bureau and of the Federal Government, attended the telegraphic conference at Rome in 1871."

RAILWAYS AND TELEGRAPHS IN RUSSIA.—From a recent chart just published, Russia is shown to possess railways and telegraph lines actually in operation which the world outside seem to know very little about; at least it is asserted that the German military authorities were quite surprised not only at the number of miles constructed, but the strategical system developed. Ten lines of railways radiate from the principal lines, uniting in St. Petersburg, Moscow and Kieff, and extend even to the Asiatic frontier. All the military centers are accessible by rail, and in a short time Russia can move large bodies of troops, and concentrate them within a few days at any desired spot.

THE *Industrial Age* states that Philadelphia and New York capitalists have taken a large amount of stock in the Loomis Ærial Telegraph project.

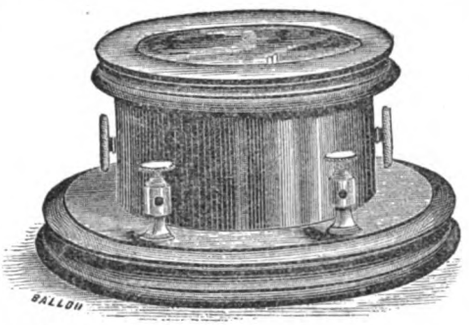
OBSERVATIONS ON THE DURATION AND MULTIPLE CHARACTER OF LIGHTNING FLASHES.

Arago has classified the different forms of lightning under three heads: 1st, linear zig-zag flashes; 2d, flashes appearing as a broadly diffused light (sheet lightning, heat lightning), and, lastly, the rarely occurring discharges which are seen as slowly moving balls of fire. The first form is due to the production in the atmosphere of a gigantic electric spark, and the majority of physicists and meteorologists suppose that flashes of the second form are due to the same cause, their light being seen either by transmission through or reflection from the clouds.

Professor O. N. Rood, of Columbia College, communicates to the *Journal of Science and Arts* an interesting paper detailing observations made by him on the nature of lightning flashes. The apparatus used was a small train of toothed wheels, driven by a spring so that it should be capable of rotating a circular paste-board disk which was provided with four open sectors. On examining lightning flashes of the second form with this rotation apparatus, it was found that each flash consisted of a considerable number of isolated and apparently instantaneous electric discharges, the interval between the components being so small that they constituted a continuous act.

From the observations made, Professor Rood concludes that the nature of the lightning discharge is more complicated than has been supposed; it is usually, if not always, multiple in character, and the duration of the isolated constituents varies very much, ranging from intervals of time shorter than one sixteen-hundreth of a second up to others at least as great as one-twentieth of a second; and, furthermore, a variety of the latter kind may sometimes be found in the components of a single flash.

In the examination of the spectrum of lightning by Dr. Vogel, a number of lines were identified as also occurring in the spectrum of the electric spark in the ordinary atmosphere; but what is remarkable, it was found that sometimes the spectra consisted of bright lines on a dark ground, while at others bright lines were traced on a less bright continuous spectrum, and, finally, sometimes a continuous spectrum, destitute of lines, was obtained. The discharges were principally of sheet lightning. Professor Rood considers that the continuous spectra, destitute of lines, were due to the prolonged constituents above referred to; and the occurrence of bright lines on a less bright ground, he refers to cases where instantaneous and prolonged constituents were noticed by himself, the normal spectrum of bright lines on a dark ground being produced by flashes more nearly instantaneous. It is also believed that zig-zag, heat, and sheet lightning are really identical, being in point of fact due to the same cause, but viewed under different conditions.



From the study of lightning flashes, the author recommends a black or gray opaque disk about 3·9 inches in diameter, with one open sector. The best form for the shortest and longest durations is that of a square, with sides of from 0·27 to 0·39 inch; for examining the multiple character of flashes, simply a long narrow sector of 1° or 2° is preferable. A spring rotation apparatus may be used, so as to admit of rotation up to twenty or thirty per second.

M. A. Boillot describes the method for preparing ozone, by bringing oxygen in the vicinity of electricity passing through broken or pulverized gas-carbon contained in a tube.

TELEGRAPH SUPPLIES.

THE LITTLE MONITOR RELAY

Is a substantially made and good working Instrument, incased in a polished Rubber Cylinder with Plate Glass Cover, has back and front Adjustment.

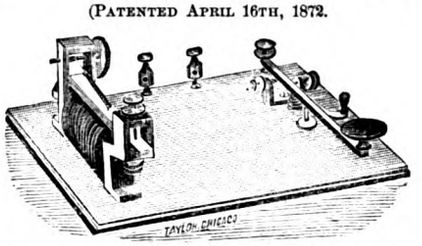
EVERY INSTRUMENT WARRANTED.

Price, $10.00.

Also, LITTLE MONITOR SOUNDER, to match, *Price, $6.00.*

And Small Size W. U. KEY, *Price, $4.00.*

All kinds of Learner's Instruments, with Instructions, constantly on hand. Send for Circular.



M. A. BUELL,

26 Waring Block,

CLEVELAND, O.

The Amateur's Telegraph Apparatus.

(Patented April 16th, 1872.

This is no toy, but a *bona fide* Telegraph Instrument, with a full-sized trunnion lever Key, with friction Circuit Closet and a Pony Sounder, both on same base.

The battery used is Hill's Patent Gravity Battery, which is considered to be the most constant and economical Telegraph Battery in use. A small size is made expressly for the above apparatus.

With each Instrument is furnished:

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners.

This is sufficient outfit for the student; and all can be set upon a table, or the battery can be set upon a shelf near the table.

In operating a short line, there will only be required, in addition to the above, more cups of battery, according to the length of line.

A Complete Outfit for a Telegraph Office,

WITH BOOK OF INSTRUCTION,

FOR

Seven Dollars and Fifty Cents.

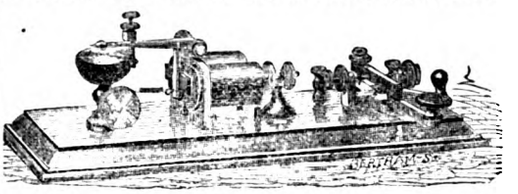
MANUFACTURERS OF

Electrical and Telegraph Instruments



AND

Material of Every Description,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc.

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER.

ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

[SOLE MANUFACTURERS OF THE

NEW PATENT BALTIMORE BATTERY,

MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7½ inches,
Specially adapted to Railroad Signals, Printing Instruments, etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country having proven the cheapest, and least trouble to maintain of any in the market.

Patented Dec. 31, 1872.

Also, Sole Manufacturers of the

Patent Circuit Closer Key,
O'Sullivan Self-closing Key,
Scott's Patent Hotel Annunciator,

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE

PATENT BATTERY INSULATOR

shown, holding a cup of the Baltimore Battery in the above cut, which most effectually insulates the Battery as the drip passes off *through a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. Prescott, says of it:—"I think your Battery Insulator is very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.

Repairers' Tools constantly on hand.

Importers and Dealers in best English and American Galvanized Wire.

Manifold Paper, for Train Orders, etc. Also, Agate Pens.

In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices.

TELEGRAPHERS' EMPLOYMENT BUREAU,

TOLEDO, OHIO.

— o —

A Telegraphers' Employment Bureau has been established in this city, under the direction of several well known Telegraph Superintendents, having for its object the reception of applications for positions as operators, or operators and clerks or agents combined.

Applicants must state:

1st—Age. How long in the service. Reason for changing position. Present salary. Sound or paper reader. Able bodied or otherwise.

2d—Applicants must send recommendations from present employer, or if not at work, from former employer as to moral character and capabilities. Recommendations to state if applicant is capable of filling positions other than operator, such as ticket agent, freight clerk, or agent.

This list will be published monthly and forwarded to the Superintendents of Telegraph Lines and a copy sent to each applicant whose name is printed thereon. All names to be published two (2) months. All applications to be accompanied by a fee of two (2) dollars.

Address,

Telegraphers' Employment Bureau,

TOLEDO, O.

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 11. NEW YORK, MAY 1, 1873. WHOLE NO. 132.

HOLTZ'S ELECTRICAL MACHINE.

In the electrical machines described in our last issue, electricity is produced by the friction of one substance against another. Quite recently several machines have been invented of quite a different kind, in which a body is electrified once for all, and made to act by induction upon a movable system in such a way as to produce a continual generation of electricity. The most successful of these is that invented by Holtz, of Berlin, in 1865. (Fig. 1.)

It contains two thin circular plates of glass, one of which (A) is fixed, while the other (B), which is rather smaller, can be made to revolve very near it. In the fixed plate there are two large holes or windows, near the extremities of its horizontal diameter. Across these, and partly covering them, are glued two paper bands or armatures, having points *f*, *f'* directed the opposite way to that in which the movement takes place. Two metallic combs, P, P', are placed opposite the windows, on the other side of the revolving plate, and are connected with two insulated conductors terminating in the knobs *n*, *m*, which may be called the poles or electrodes of the machine. These knobs can be set at any distance asunder. In starting the machine, they are placed in contact; and one of the armatures, suppose *f*, is electrified by holding against it a sheet of vulcanite which has been charged with negative electricity by friction. The plate is then turned for a few seconds, and the two knobs are gradually separated.

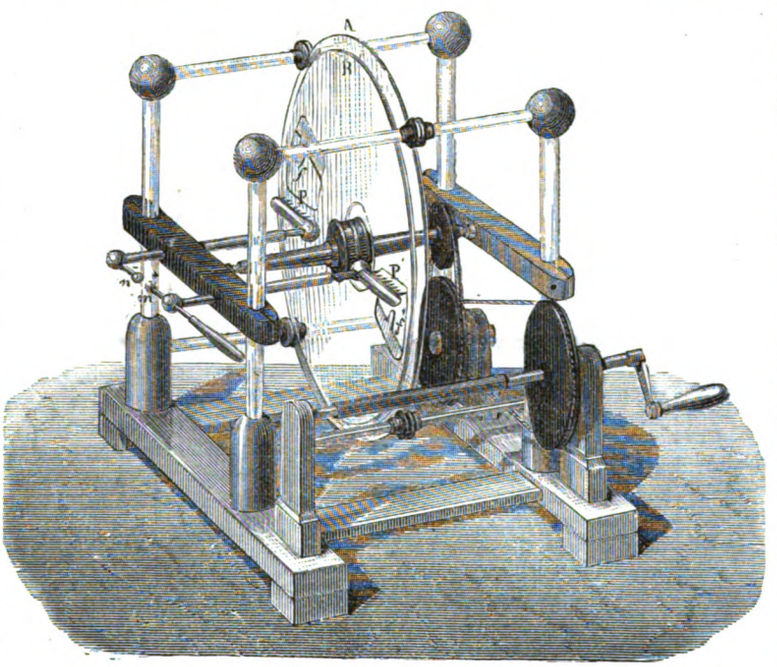

Fig. 1.

A continuous crackling noise is immediately produced at the place of separation, resulting from electric discharge across the interval. In the circumstances supposed, the knob *n* is the negative, and the knob *m* the positive electrode. In dry weather, the machine, when once started, will continue in action for a long time if the motion is kept up, but it soon ceases to act if the air is damp, being even more sensitive to moisture than the ordinary machine.

The action of the machine is as follows: The negative electricity of the armature *f*, acting inductively on the opposed conductor, from which it is separated by the revolving plate, causes this conductor to discharge positive electricity through the comb upon the face of the plate, and thus to acquire a negative charge. When the part of the plate which has been thus affected comes opposite the other armature, the latter is affected inductively, and discharges negative electricity through its point *f'* upon the back of the plate, thus becoming itself positively electrified. Positive electricity from the front of the plate is, at the same time, collected by the comb P', an equal quantity of negative being of course discharged from the comb upon the plate. In the subsequent stages of the process, the negative electricity thus discharged upon the face of the plate exceeds the positive which was previously there, so that the face of the plate passes on with a negative charge. When the portion of the plate which we are considering again comes opposite *f*, it increases the negative electrification both of the armature and the conductor, inasmuch as it has more of negative or less of positive electricity upon both its surfaces than it had when it last moved away from that position. Both armatures thus become more and more strongly electrified, until a limit is attained which depends on the goodness of the insulation; and as the electrification of the armatures increases,

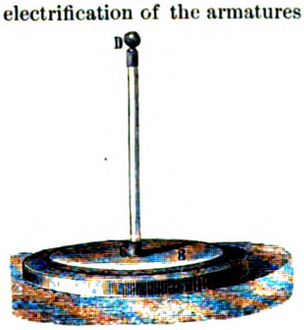

Fig. 2.

the conductors also become more powerfully affected, and are able to discharge to each other by the knobs *m n* at a continually increasing distance.

The inventor has recently introduced a modified form of his machine. The plates are placed horizontally; they have neither windows nor armatures, and they both revolve, but in opposite directions. Two conductors, furnished with rows of points, are placed above the upper plate at the extremities of one diameter, and two others below the lower plate at the extremities of another diameter perpendicular to the former. Each of the upper conductors is connected with one of the lower, so that there are virtually only two conductors. In starting the machine, a sector of electrified vulcanite is held over the upper plate, opposite one of the lower combs. When the machine has been turned for a few seconds, the sector may be removed, and a continual discharge of sparks takes place between the two knobs which are connected with the two conducting systems. Frequently a comb is placed above, opposite to the lower comb, and this arrangement appears to increase the efficiency of the machine.

The action in this form of the machine also depends upon induction, the conductors performing the duty of armatures as well. We shall not enter into details, but merely remark that, in both forms of the machine, work is spent in turning the plates in opposition to electrical attractions and repulsions, and that the mechanical energy thus consumed produces an equivalent in the form of electrical energy.

When electricity is required in comparatively small quantities, it is readily supplied by the simple apparatus called the *electrophorus*. This consists (fig. 2) of a disc of resin, or some other material easily excited by friction, and of a polished metal disc B, with an insulating handle C D. The resin disc is electrified by striking or rubbing it with catskin or flannel, and the metal plate is then laid upon it. In these circumstances, the upper plate does not receive a direct charge from the lower, but, if touched with the finger (to connect it with the earth), receives an opposite charge by induction. On lifting it away by its insulating handle, it is found to be charged, and will give a spark. It may then be replaced on the lower plate (touching it at the same time with the finger), and the process repeated an indefinite number of times without any fresh excitation, if the weather is favorable.

The resinous plate has usually a base or *sole* of metal, which is in connection with the earth while the electrophorus is being worked. This sole, by the mutual induction which takes place between it and the upper plate or *cover*, increases the capacity of the latter, and thus increases the charge acquired. When the cover receives its positive charge on being connected with the earth, the sole at the same time receives from the earth a negative charge; and as the cover is gradually lifted, this negative charge

Digitized by Google

gradually returns to the earth. The most convenient form of the electrophorus is that of Professor Phillips, in which the cover, when placed upon the resinous plate, comes into metallic connection with the metal plate below. That this arrangement is allowable is evident, when we reflect that, when the upper plate is touched with the finger, it is in fact connected with the lower plate, since both are connected with the earth; and it effects a great saving of time when many sparks are required in quick succession, for the cover may be raised and lowered as fast as we please, coming alternately into contact with the resinous plate and the body which we wish to charge.

THE INVENTION OF THE LEYDEN JAR.

Certain parts of works on physical science, written a century or more ago, are at the present day sometimes very interesting to read on account of the expressions of delight indulged in by the authors, on matters which, at present, are considered of a trifling interest with what is now known in regard to the sciences of nature. Priestley, in his "History of Electricity," published in London, 1767, says; "The end of the year 1745, and the beginning of 1749, is celebrated by reason of the most astonishing discoveries which have ever been made in the whole field of electrical science, namely, the wonderful condensation of this force in a glass named the Leyden jar, because it was first made by Cuneus, of Leyden, while experimenting with Professor van Muschenbroek," etc.

The history of the discovery of that form of electric induction on which the invention of the Leyden jar is founded, is thus given by Desaguillers: "Professor van Muschenbroek, of Leyden, Holland, and some of his friends, observing that electrified bodies, exposed to the air, lost their electricity rapidly, imagined that, if they inclosed a conducting body in a non-conductor, it would become possible to charge more electricity into the conductor and retain it longer. As a glass bottle was the most convenient non-conductor, and water the most common conductor, water was placed in a bottle, a brass rod put in the water, and the same charged by the intervention of this rod; but nothing particular was observed till Mr. Cuneus, who supported the glass flask by his left hand while it was being charged, supposing that the water had received as much electricity as it could contain, attempted to withdraw the brass wire with his right hand, when he was suddenly frightened by a violent shock in his arms and chest." The water served here for the inner coating of the jar, and his left hand for the outer coating; and yet, however simple and easily repeated the experiment is, there were at that time many experimenters who, after reading the published accounts, and trying it for themselves, did not succeed, being still in the dark about the conditions required for success, which at the present day are so well known.

It has been proved that the discovery of the same principle, and its application by Von Kleist, in Germany, in the same year, was without knowledge of the above, each investigator working independently of the other. Those who succeeded gave the most exaggerated account of their feelings. Professor Van Muschenbroek, who made the experiment with a flask of very thin glass, and therefore obtained a most powerful charge, declared in a published letter that he was so violently struck in his arms, shoulders, and chest, that he lost his breath, and two days elapsed before he was recovered from his fright. He adds that he would not submit to a second shock for the whole kingdom of France.

M. Allamand made the experiment with a common glass tumbler, and says also that the shock took his breath away; that he felt such a violent pain in his arms as to fear serious consequences, but that it passed over without injury to him. Winckler, of Leipeic, tells another story. He says that when he first performed the Leyden experiment upon himself, he felt strong convulsions over his whole body; his blood was brought into a most violent agitation, and a burning fever would have been the result if he had not taken cooling medicines. He felt also a heaviness in his head, as if a large stone laid upon it; it caused him twice to bleed at the nose, which otherwise seldom took place. His wife appears to have been of an investigating turn of mind, and much less afraid than he; she took the shock twice, but Winckler says she was then so weakened that she could not walk, and a week later, having obtained the necessary courage to give her another shock, she commenced at once to bleed from the nose.

But everybody was not so foolishly frightened, M. Bose, with a truly philosophical courage, worthy of Empedocles, wished to be killed by the electric shock, in order that the account of his scientific death might procure an article for the Memoirs of the French Academy of Sciences, but his wish was not fulfilled.

The electric shock produced by the Leyden jar attracted then so much general interest that many persons traveled around Europe and made a living by administering it, some of them pretending to cure by it all kinds of diseases.

Foremost of those who advanced this branch of science must be mentioned Gralath, in Germany, who, in 1746, gave the shock at great distances, and through twenty persons at once, and invented the electric battery, consisting of a number of Leyden jars. Finally, Drs. Watson and Bevis, according to the *Philosophical Transactions*, found the modern method of covering the outside of the jars with tinfoil, while the first connected several separate masses of combustible fluid, with metallic wires, and ignited them all with the same spark. After accounting for many other experiments, he says, in a prophetic style; "Notwithstanding the many great discoveries made during the latter years in this branch of natural sciences, posterity will consider our knowledge to be in its infancy; therefore we must, in so far as experiments justify us, be ready to modify or abandon our conclusions as soon as other more probable theories are proposed."

Another investigator, quoting these words fifty years later, says: "Considering the rapid progress since that time, we may hope that even the so enormously advanced science of the present day (1795) will, at some future time, be looked upon as merely in its infancy."

THE great globe which we inhabit is itself a magnet. On the one side of the magnetic equator, the north end of the needle dips; on the other side, the south end dips, the dip varying from nothing to ninety degrees. If we go to the equatorial regions of the earth with a suitably suspended needle, we shall find there the position of the needle to be horizontal. If we sail north, one end of the needle dips; if we sail south, the opposite end dips; and over the north or south terrestrial magnetic pole the needle sets vertical. The south magnetic pole has not yet been found, but Sir James Ross discovered the north magnetic pole on the 1st of June, 1831.—*Faraday.*

ON A NEW RELATION BETWEEN HEAT AND ELECTRICITY.

BY FREDERICK GUTHRIE.

It is found that the reaction between an electrified body and a neighboring neutral one, whereby the electricity in the neutral body is inductively decomposed and attraction produced, undergoes a modification when the neutral body is considerably heated.

Under many circumstances it is found that the electrified body is rapidly and completely discharged. The action of discharge is shown to depend mainly upon the following conditions:—(1). The temperature of the discharging body, and its distance from the electrified one. (2). The nature (+ or —) of the latter's electricity.

With regard to (1), it is shown that the discharging power of a hot body diminishes with its distance and increases with its temperature. But, concerning the temperature, it is proved that the discharging power of a hot body does not depend upon the quantity of heat radiated from it to the electrified body, but chiefly upon its quality. Thus a white-hot platinum wire connected with the earth may exercise an indefinitely greater discharging power, at the same distance, than a large mass of iron at 100° C., though the latter may impart more heat to the electrified body.

Neither the mere reception of heat, however intense, by the electrified body, unless the latter have such small capacity as to be itself intensely heated, discharges the electricity if the source of heat be distant, nor is discharge effected when the electrified body and a neighboring cold one are surrounded by air through which intense heat is passing; but, for the discharge, it is necessary that heat of intensity pass to the electrified body from a neutral body within inductive range.

White and red-hot metallic neutral bodies exercise this discharging power even when isolated from the earth, but always with less facility than when earth-connected.

The hotter the discharging body, whether isolated or earth-connected, the more nearly alike do + or — electricities behave in being discharged; but at certain temperatures distinct differences are noticed. The — electricity, in all cases of difference, is discharged with greater facility than the +.

It is shown that various flames, both earth-connected and isolated, have an exceedingly great power of discharging both kinds of electricity.

The effects in regard to discharge are shown to be similar when platinum-wire, rendered hot by a galvanic current, is used, and also when the condensed electricity of a Leyden jar is experimented on.

As hot iron shows a preferential power of discharging — over + electricity, so it is found that white-hot, but isolated, iron refuses to be charged either with + or — electricity. As the iron cools, it acquires first the power of receiving —, and afterwards of receiving +. Further, while white-hot iron in contact with an electrified body prevents that body from retaining a charge of either kind of electricity, as it cools it permits a + charge to be received, and subsequently a — one.

A suggestion is made as to the existence of an electrical coercitive force, the presence of which, together with its diminution by heat, would explain much of what has been described.

THE heathen Chinee's ideas of the uses and habits of deep-sea telegraphic cables are rather peculiar. Some of these innocent Confucians make a living by fishing up the wires, cutting them, and selling the pieces. Occasionally they vary their dark ways by resetting the cable like a verbena or a geranium, in order that it may grow and serve for future provision.

TELEGRAPH POLES.

In India, Central Asia and Australia, where great telegraph lines have been erected, iron poles have been especially made, which have answered all constructional requirements and which has since proved to be the most economical means of carrying wires above ground.

On the application of iron to this purpose, Major Webber lately read a paper before the Society of Telegraph Engineers in England, in which he adverted to the different forms of metal poles proposed. Some are constructed like railway signal posts, others like split tapered tubes, telescopes, lattice and ribbons. Others again have been made of multiple iron bars of T and H sections or of cast and wrought iron tapered tubes, connected by socket joints. As a general rule no one design is applicable to all situations, for on ordinary roads the mathematical curves of a railway are not met with, but, in their stead, every abrupt angular change or tortuous winding. The poles should be strong enough to carry the weight of the wire at the requisite height from the ground without bending, and rigid enough to resist the pressure of wind. When placed in the ground straight, they will require no side support, but when at an angle they will hardly resist the lateral strain due to the wires. A wooden pole, unless placed so as to partially convert strain into thrust, cannot long resist strain with the resistance furnished by the ground alone. The difficulty lies, not in making a pole with the necessary strength, but in obtaining a sufficiently unyielding mass to hold it upright against the horizontal strains to which it is subjected.

Lieutenant Jekyll, R. E., having analyzed the forces to which poles are subject, considers a stay superior to a strut in affording support. Where stays or struts cannot be fixed at the same height as the wire, it is better to attach them above than below it. An iron loop at the arm bolt would form a good means for the attachment of a stay; the loop should be put on inside the arm and be galvanized. The defects of struts are sometimes remedied by anchoring or foot-staying the pole and by bracing the pole and strut together in the middle with twisted wire; though even this precaution does not prevent the top from bending.

When local circumstances preclude the use of either stays or struts, trussing may be employed with advantage. The pole for this purpose is supported horizontally by a crutch at each end, in which position it sags slightly in the middle. A block of wood about two feet in length and the same thickness as the pole, is halved into and spiked to the butt of the poles at right angles to its length. A spur about one foot in length is fixed on the side of the pole, half way between the ground line and the top. An ordinary stay rod is grooved into the side of the butt and passed through the block at the bottom, and an iron hoop is attached to the bolt of the top arm. A twisted wire stay is then made between the loop at the top and the eye of the stay rod at the bottom, which, when tightly secured, is stretched over the spur as a bow is drawn. It will then be found to be quite tight and to impart a slight bend to the pole, which can be further increased, if required, by screwing up the nut at the end of the stay rod. The block at the bottom may be bolted side by side to the pole, and a four-armed spur is recommended. The trust wire must be placed on the same vertical plane with the resultant of the wire strains. The ground, and especially near the foot, where blocks should be used, must furnish the necessary support. In cases of withstanding exceptional pressures, double or A poles are sometimes used.

Mr. W. Siemens considers that in the employment of iron poles a buckled wrought iron foot-plate is of advantage, as affording a much firmer foundation. The portion of the post which is partly buried in the ground and therefore exposed to the simultaneous action of moisture and air, is made of cast iron and is of tubular form. This tube is fastened to the buckled plate by means of four bolts, and is provided at its upper end with a suitable pocket to receive the upper tube, which is made of wrought iron. The shape is approximately parabolic. The tubes are cemented with a mixture of sulphur and oxide of iron. 180,000 poles, thus arranged, have been erected by the Messrs. Siemens in South America, with satisfactory results. They are not as cheap as wooden poles in the first outlay, but are of course not subject to dry rot.

NEW MAGNETO-ELECTRIC MACHINE.

We have had an opportunity of witnessing the trial of a magneto-electric machine, which appears to be likely to give satisfactory results, says the *Engineer*. It consists of a row of modified horse shoe electro-magnets, surmounted by another row of inverted similar electro-magnets, the poles consequently being face to face, but of course separated by a space. In the central space there revolves a drum carrying the armatures, one armature being supplied to every pair of magnets. The armatures are simply rings or hoops of soft iron, surrounded by a number of helices containing wire. The ends of the wires of each helix are brought down to the shaft of the drum, each insulated from the other, and thence the currents are collected in the usual way. Pieces of iron attached to the poles of the magnets partly embrace without touching the armatures. In the machine in question there were three armatures, one of which was sufficient to excite all the magnets by means of the induced current, as above described, and the other two were sufficient to provide a powerful current, which gave an excellent light in one of Mr. Ladd's lamps. The power required to drive the machine was about 3½ or 4 horse.

Lenz's Law.—Considering the induction effects produced by the motion of a wire through which a current is passing upon another wire formed into a closed circuit, Lenz was led to give the following law, which is known by his name: "Whenever a relative displacement takes place between a current and a closed circuit in the natural state, the latter is traversed by an induced current, which reacts so as to determine a motion in the opposite direction—or, what comes to the same thing, which is opposite to the current that would produce the same displacement." Thus, when we diminish the distance between two parallel wires, one of which transmits a current, the other forming a closed circuit, we obtain in the latter an inverse current; and we know that two parallel currents in opposite directions repel one another.

Powerful Electro-Magnets.—M. Jamin of Paris has exhibited to the French Academy an artificial magnet, weighing 4-4 pounds, of which the carrying force is 99 pounds. This result has been gained by substituting very thin leaves, thoroughly magnetized—to saturation, as the inventor expresses it—for the thick plates formerly used in constructing electro-magnets.

An idea of the magnitude of the power thus obtained may be gathered from the fact that, although some natural magnets have carried loads of twenty times the sustaining capacity of the best artificial magnets, has not exceeded four or five times their weight. The practical application of M. Jamin's discovery will be to diminish, in an immense degree, the volume and weight of the magneto-electric machines for the production of light and electricity.

ON THE INDUCTION OF ELECTRIC CURRENTS IN AN INFINITE PLANE SHEET OF UNIFORMLY CONDUCTING MATTER.

By Prof. Maxwell, F.R.S.

The currents are supposed to be induced in the sheet by the variation in position or intensity of any system of magnets or electro-magnets.

When any system of currents is excited in the sheet, and then left to itself, it gradually decays, on account of the resistance of the sheet. At any point on the positive side of the sheet, the electro-magnetic action is precisely the same as if the sheet with its currents, retaining their original intensity had been carried away in the negative direction with a constant velocity R, where R is the value in an electro-magnetic measure, of the resistance of a rectangular portion of the sheet, of length 1 and breadth 2 in. This velocity, for a sheet of copper of best quality of one millimetre thickness, is about twenty-five metres per second, and is, therefore, in general comparable with the velocities attainable in experiments with rotating apparatus.

When an electro-magnet is suddenly excited on the positive side of the sheet, a system of currents is induced in the sheet, the effect of which on any point on the negative side is, *at the first instant*, such as exactly to neutralize the effect of the magnet itself. The effect of the decay of this system of currents is therefore equivalent to that of an image of the magnet, equal and opposite to the real magnet, from the position of the real magnet, in the direction of the normal drawn away from the sheet, with the constant velocity R.

When any change occurs in an electro-magnetic system, whether by its motion or by the variation of its intensity, we may conceive the change to take place by the superposition of any imaginary system upon the original system; the imaginary system being equivalent to the difference between the original and the final state of the system.

The currents excited in the sheet by this change will gradually decay, and their effect will be equivalent to that of imaginary system carried away from the sheet with the constant velocity R.

When a magnet or electro-magnet moves or varies in any continuous manner, a succession of imaginary magnetic systems like those already described is formed, and each, as it is formed, begins to move away from the sheet with the constant velocity R. In this way a train or trail of images is formed, moves off, parallel to itself, away from the sheet, as the smoke of a steamer ascends in still air from the moving funnel.

When the sheet itself is in motion, the currents, relatively to the sheet, are the same as if the sheet had been at rest, and the magnets had moved with the same relative velocity. The only difference is, that whereas when the sheet is at rest, no difference of electric potential is produced in different parts of the sheet, differences of potential, which may be detected by fixed electrodes, are produced in the moving sheet.

Pneumatic Despatch.—In the application and employment of pneumatic despatch tubes, for the transmission of despatches from the various telegraphic posts to the central office, in Paris, MM. Mignon and Rouart have utilized, for the compression of the air, the force generated by the pressure of water in the service pipes, with considerable economy. The cubical contents of the reservoirs provided is three times the capacity of a kilometre of pipe. The cost of water for the transmission of a train of 500 despatches through a distance of one kilometre is about 25 centimes (2½d).

CORRESPONDENCE.

To the Editor of the Journal of the Telegraph:

With your permission, a word in regard to the proposed change of alphabet.

Most certainly any change of the kind proposed can but be injurious in the extreme, and would seem to have originated in nothing higher than that most miserable of all American ideas—that of aping and worshiping European ways and fashions.

What matter to us if our alphabet is not universal? It is American, and is the pioneer of all. Morse invented the telegraph, and Europe endeavored to rob him of it, but failed. Morse invented our alphabet to perfect his first invention; and this same alphabet has, I doubt not, been the means of transmitting a greater amount of intelligence and correspondence, in the past ten years, than has been transmitted over all the wires using the "English," "Continental," "International," or whatever high-sounding name they may give it, since its first adoption. And we are asked to discard our good old Morse and adopt the foreigner, merely that we can be, as the Pharisee thanked God he was not, as other men are. Why not propose that Americans use burnt cork as an article of the toilet, merely because the people of Africa are black? We have as much occasion for African color as for European alphabets in our telegraphy. The idea that it is to get clear of spaced letters is all bosh. If not, why not substitute other characters for spaced letters and leave others undisturbed? Why use the J character for C, and F for R, and so on, thus compelling an old operator to learn to look on white as black and black as white?

Have the proposers of this matter considered what they are asking?

Consider the number of operators using the Morse to whom an error in transmitting or receiving seems almost an impossibility, and on whose brain the characters of the Morse are branded as with an iron and as firmly rooted as the words of a person's mother tongue. Are these men all to be sent back into the primary school of telegraphy? And think you they can ever become again greater than mediocre? Do not deceive yourselves till it is too late. This alphabet is to them as is the mother tongue, which is the only tongue a person can ever speak in purity and perfection. It will always interfere with any new language to be accomplished, to an extent that will cause the most persevering and accomplished student to rate, in the pronunciation of any new language he may acquire, far below persons of scarcely any education, but whose mother tongue such language is. Did you ever know the most accomplished foreigner, French, German, Italian, or what not, who, after twenty or even thirty years' residence in this country, could so speak the most common sentence that the most casual listener would not recognize his foreign accent, and probably pronounce his nationality?

Change the alphabet and telegraphy in this country is checked for at least five years, by reducing the first-class operators and "plugs" to the same level, while other countries maintain their onward march.

Turn your backs upon the "plugs," or send them back to school, and no change will then be needed.

The telegraph companies of this country will pay more damages from errors of operators now ranking first-class, within the first year after such change takes effect, all caused by confusing the characters of the old and new, than they have paid in any five from blundering of "plugs" with spaced letters.

In conclusion, I would ask how many operators who cannot write spaced letters correctly would be able to write legibly the following simple message with the "Continental" alphabet?

"*To John Morton, 109 West 28th St., New York City: Meet mother at depot to-morrow morning at ten* (10) *o'clock.*

(Sig.) THOMAS MORGAN."

Show me an operator who cannot write distinctly any word of spaced letters such as "*error*," "received," "receipt," "record," or any other, and I will show you in the same individual a "plug" who cannot with the "Continental" write the commonest word in the English language, *i. e.* the word "*common.*"

AMERICUS.

FRANCISVILLE, MD., April 5th, 1873.

To the Editor of the Journal of the Telegraph:

I notice in your issue of March 15th a great deal in reference to a change in alphabet, and various good reasons for the change.

However, I see none offered which are calculated to effect the desired result; and as it is a matter of importance, or at least interest, to every telegrapher, I offer my opinion, which, if not very important, accords with my experience and that of many of us with whom I have conversed upon the subject. In the first place I regard our present alphabet as superior to the "European alphabet," even with its spaced letters, and although "the spaced letters" are the cause of many of the errors in copying, they can not be more so than would some of the clumsy letters in the "European alphabet."

There is a necessity for a change; yet why could not our alphabet be improved, and let others adopt ours instead of us adopting an alphabet which is extremely "clumsy" and no improvement upon ours whatever?

R. L. M.

To the Editor of the Journal of the Telegraph:

If the only object in changing the alphabet would be to get clear of the spaced letters, why not substitute characters entirely new for them only? Could they not be learned more readily and with *less risk* of making mistakes, than adopting a new alphabet, or changing, in any way, our good old Morse characters; and are not characters such as - — - - - - - — - - - - -

to substantiate my assertion that they come from careless and incompetent operators. What the Company desires is accuracy and speed in the transmission of business, and I think we have more of these qualities in our alphabet than we get in the European; for instance, take their letters that contain a number of dashes, and use them where the ends with the dashes connect, and I am sure it will take a longer time to transmit them accurately than it would with our spaced letters, and at the same time be as liable to make mistakes (if not more so) than with our spaced letters. The idea suggested by "H." that it would be a trifling matter to make the change, and only take two weeks, is absurd, as I think that the mistakes and delays that would necessarily follow would injure the Company more than all the "bulls" that would arise from our spaced letters in half a century.

I will admit that there may be room for improvement in our alphabet, as far as spaced letters are concerned; and if any change should ever be made, it should be confined to those alone. Let the change be as limited as possible, and it will cause more or less confusion, and the less the better. The Company has done well, and is doing well, and its prospects are brightening every day. Mistakes occur in all kinds of business, and there are losses to corporations, and always will be as long as there is business done. And I think that the losses that the Company sustain from the source my friends H. and H. H. W. speak of, or have reference to, would not be a drop in the bucket, compared with losses of other corporations. And still they are powerless to prevent them, do what they may; and sometimes what they think will remedy the matter only makes it worse. So what is the use of swapping horses unless you are *certain* that you are going to get one that will answer your purpose better in every respect than the old and tried ones. And I am confident that the majority (and a large one) of the operators prefer the alphabet as it is. E. A. T.

WINTHROP, Me., April 12, 1873.

To the Editor of the Journal of the Telegraph:

About the end of the year 1857, Mr. Culley, then Division Superintendent of the Electric and International Telegraph Company, at Edinburgh, (Scotland,) issued an order to the effect that a fortnight hence the Morse instrument would be substituted for the Double Needle instrument, on all long and important circuits running into that office, and that clerks who could work the new instrument would be promoted at once.

We had served an apprenticeship in the Double Needle alphabet, and, taking the staff on an average, could read 45 words per minute—50 per minute had been frequently acquired on reports during the Crimean war, and on one occasion, on a speech delivered by John Bright at Glasgow, (Scotland,) a certain clerk had averaged 60 words per minute for upwards of two hours—and, all being good clerks, we were much prejudiced against what we deemed an innovation.

Nevertheless we set ourselves to the task, and at the end of the fortnight only one man was disqualified, and he is now Train Dispatcher on the C., B. and Q. R. R., and a first-class Morse operator.

If a change of alphabet is really necessary, (and I think it certainly is,) I am satisfied that a fortnight's notice is sufficient for the majority of operators; and as for the rest, let them go. Those space letters ARE a nuisance. If all operators were A1 there would be no need of alteration, but they are not. A telegraphic alphabet should be composed so as to be as near as possible to perfection, to suit the majority. WINTHROP.

SALISBURY, MD., April 9th, 1873.

To the Editor of the Journal of the Telegraph:

On the proposed change of Telegraph Alphabet: Why do we want a change? where is the need of it? and what is the trouble with the present good old "Morse?"

I have read where some one has said, to "secure more perfect accuracy," to "secure speed," &c., &c. Well, if a competent operator be placed at each end of a wire, and its sender writes good "Morse," how and by what means can you secure anything more plain or accurate? Just as fast as the fastest penman can get it scrawled down. I will wager a month's pay, if the matter could be tested, the W. U. Tel. Co. has in its employ plenty of men who can send, or receive, faster, and with more accuracy, with the old "Morse," than any Englishman, Frenchman, Dutchman or Spaniard, that can be found in all the land of their respective countries—with their Dutch alphabet.

To illustrate: - - - - - - - - - - —. What is plainer? Among the first words a student learns to catch. But imagine — - — —, — — —, - - —. The call of my office is "Sy" - - - - - -; a very pretty, neat and appropriate call. But just listen to a fellow plugging away thus - - -, — - - —. And then the numerals—worse than ever. This is not so much an item to commercial operators, but with us R. R. Operators it is a matter of great importance. For instance, Car No. 2009 - - — - -, —, —, — - - —, (- - — — —, — — — —, — — — — —, — — — —). I pity a poor paper operator, unless he has plenty of room for his paper to run, and plenty of time to count out dashes.

We are not going to plead inability or unwillingness to learn the new alphabet, when it has really been shown a necessity and advantage (but we think it an absurdity to talk about this being an improvement), and if it becomes an international necessity.

It has been some five or six years since I worked in a city office, and am not probably up to the fast age in which we live—but, to express a countryman's views, I don't see the international necessity.

Have you any records of fastest time accomplished by any of our cousins across the waters, with this *dashed up* alphabet? And how does it compare with our record of 42 to 52 words per minute?

AMERICA.

To the Editor of the Journal of the Telegraph:

The phrase "a universal alphabet" sounds well, but who would exchange for the name? Count the cost for a high-sounding title. Merit is the real question. There is nothing in the "Morse" objectionable, unless it is the spaced letters. But why should we transfer so many letters and substitute so many new combinations in the alphabet, and exchange all the numerals for characters very much more clumsy, saying nothing about the punctuations; all this for the purpose of getting rid of the spaced letters? How absurd.

Some maintain that a change is unnecessary; that if operators were required to "write Morse" the point would be settled. Does any one expect to live to see the time when a Board of Examiners will be resorted to, or suppose that an executive order would reach the difficulty. He who looks for remedy aside from a change in the alphabet, looks in vain. A change is the most certain way of reaching the evil, so far as relates to the spaced letters.

As to the wretched formation of other characters, a change in alphabets would avail nothing.

No doubt many who write carelessly can write well; others are constitutionally defective, perhaps nervous system shattered, but a still larger class of bunglers are those whose early training at the key has been neglected. This is certainly a matter of great importance. Teachers should see that their students make every letter perfectly, and space properly between letters, and also between words. The teacher is undoubtedly responsible for the manner in which the characters are formed, until the student is sufficiently advanced to realize the necessity for the great care that should be thus exercised. Many, from ignorance and lack of proper instructions, fall into a shuffling habit of writing which becomes next to impossible to correct.

There are many operators who have no difficulty worth mentioning with the "Morse." It is absurd to say that operators of the present day will not compare favorably with those of the past. There may be more inefficient operators now, but what does that prove? Every profession has its "mules," every calling its quacks, and as the number engaged in any calling increases, it is presumed those who have "missed their calling" will increase in number also.

What you or myself might accomplish with "Morse" is of little consequence to the profession. Now and then one may accomplish extraordinary things and be called a clever fellow, especially if he is modest about it. But the question is, what will the masses do?

If change we *must*, pray don't change anything but the "spaced letters." Even that will cause great confusion. W. B.

BLOOMSBURG, April 16, 1873.

To the Editor of the Journal of the Telegraph:

I received a half-rate message about seven o'clock P. M., to be mailed; mail was closed same evening, to start out early in morning. Was I right in mailing it that evening? W. A.

Answer.—It was right to mail it that evening under the circumstances mentioned.

A B C.—Lightning arresters are used in offices to carry off the charges arising from thunder storms, which, without such protection, might cause damage. They can be had by requisition upon your Superintendent.

H. H. MORING.—The question you ask, "What will it cost to build and equip a line twelve miles long," is very indefinite. It depends entirely upon the size and quality of the poles and wire, the number and form of instruments, and the price of labor.

DELAWARE, O.—Messsages of Professors or Students at Universities are to be treated in the same manner as the business of other parties. No one is exempt from the rules of the Company.

AN EMPLOYÉ.—It is correct to count the expressions "Mother's coming," or "Mother's arrived," as two words. Mothers is but one word. The Company does not assume to know the literal meaning of messages offered for transmission.

BEGINNERS.—We do not understand what you mean by the inquiry, "Who has to stand the postage of inquiries, answers," &c.

JACK.—Thanks for your kindness in keeping the JOURNAL posted. The matter contained in your letter, however, cannot be published, for reasons given in our issue of February 1st.

N. W. O.—There is no work published in America which contains an account of all improvements recently developed in electricity and telegraphy, nor, to our knowledge, in any other country. The JOURNAL is a complete record of everything pertaining to the science, and proper attention to its contents will afford as much information as the study of any manual or compendium. Any knowledge at our command is gladly imparted to enquirers.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
May 1, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Evansville, Ala., closed.
Carpenter's Sta., Ala., closed.
Elk Point, Dac., should read 30 2 463 Sioux City, Iowa.
Fargo, " should read 175 12 307 Chicago, Ill.
Vermillion, " should read 50 3 463 Sioux City, Iowa.
Yankton, " should read 75 5 463 " " "
Sioux City Junction, Iowa, changed to Tara.
Sandy Hook, Md., closed.
Hopewell Cross Roads, Md., closed.
Darlington, Md,, re-opened.
An office has been opened at East Cambridge, Mass., square 21; check direct, erase delivery charges.
Renick, Mich., closed.
Saline, Mich., closed.
Escanaba, Mich., should read 100 7 307 Chicago, Ill.
Houghton, Mich., should read 175 12 307 " "
Ishpeming, Mich., should read 150 10 307 " "
L'anse, Mich., should read 150 10 307 " "
Marquette, Mich., should read 150 10 307 " "
Negaunee, Mich., should read 150 10 307 " "
An office has been opened at Pennington, N. J., square 47. Check direct.
Athens, N. Y., re-opened.
Warsaw, N. C., closed.
Sonora, O., closed.
Mifflinburg, Pa., is now an Other Line office; tariff for Other Line 90 and 2 from Lewisburg Junc., Pa.
Millford, Pa., is now a W. Union office, square 46. Check direct.
Birdsboro, Pa., re-opened. Square 59.
58 Gouldsboro, Luzerne Co.. Pa., should read Gouldsboro Sta., Wayne Co. P. O. A. is Sand Cut, Wayne Co.

* Carter, " 55 4 571 " "
* Piedmont, Wy., 65 4 571 " "

Offices having "Special Sheet A" will hereafter check Birdsboro, Pa., 25 cents more than "special rate" to Phila., or Harrisburg, Pa. Present rates are not to be increased.

CUBA CABLE.

The Cable to Havana, Cuba, is again working. The extra charge of three dollars per message for "Cuba Cable business," collected during the interruption of the Cable, will hereafter be discontinued.

ATLANTIC CABLE BUSINESS.

The order in JOURNAL of April 1, 1873, giving reduced rates for Atlantic Cable business, is hereby revoked. The following will be adopted instead:

Tariff of Rates, Payable in Gold, to all Points in Great Britain, Ireland and France, to take effect on and after May 1st, 1873.

NOTE.—The 10 word minimum on business to or from Great Britain and Ireland is abolished.

	To Great Britain and Ireland.	
	For each word.	*For ten words.*
From New York City, and all points in Nova Scotia, New Brunswick and New England States	$1.50	$15.00
From all points in New York (except New York City), New Jersey, Pennsylvania, Delaware, Maryland and District of Columbia	1.53	15.30
From all points in Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan and Wisconsin, from St. Louis, Mo., and from Western Union Company's offices in Florida	1.65	16.50
From all points in Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dacotah, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California, Arizona, Oregon and Washington Territory	1.70	17.00
British Columbia	1.85	18.50

NOTE.—*The rates to points beyond Great Britain and Ireland and France*, which have heretofore been computed by adding to the rate to France, will hereafter be found by adding the same amounts to the rate for ten words to London.

The tariff to France will hereafter be $1.25 for twenty words or less, and half this rate for each additional ten words or fraction thereof, in addition to the rate for ten words to London.

The rates to points in Egypt, published in JOURNAL of April 1, 1873, should be added to the rate for ten words to London.

WILLIAM ORTON,
President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, April 24, 1873.

CIRCULAR TO TRANSFER AGENTS AND OFFICES.

Referring to instructions published in JOURNAL of Sept. 16th, 1872, in regard to the cancellation of transfer orders in cases where the payee cannot be found, and in order to cut off unnecessary office messages in such instances, the following additional particulars will be observed:

Upon the receipt of a transfer order, managers are expected to use every effort to notify the payee thereof to call for same—and to continue such efforts, if necessary, for the period of forty-eight hours thereafter. If the rules in regard to "addresses," published in JOURNAL of March 15th, 1873, are strictly complied with, there should be no difficulty in this respect; but if, from any cause, the payee cannot be found within forty-eight hours, upon the expiration of that period, *and not before*, the manager should notify his local transfer agent of the fact by telegraph, stating reasons, &c. This should end the matter so far as the manager of the paying office is concerned, and no further telegraph correspondence should be had upon the subject.

The transfer agent, upon receipt of the manager's message, should at once notify the manager of the receiving office, if within his district, or the transfer agent of the district in which such receiving office is located, that the transfer has been canceled. The manager of the receiving office, upon receipt of such notice, will notify the sender and refund to him the amount of the transfer, retaining tolls and premiums. No further enquiries or explanations should be made on either side for the benefit of the parties concerned, unless such parties guarantee the payment of our regular tolls upon all the messages involved in such enquiries or explanations.

Transfer agents are requested to give their *personal* attention, whenever practicable, to the operation of the transfer service in their respective districts. Violation or neglect of the rules is the cause of most of the office messages now sent, and an occasional examination of the office messages on file would reveal any irregularity, and enable transfer agents to take the proper steps to prevent a repetition of the offence. A strict compliance with regulations should be enforced, and any difficulties experienced reported to this office.

GEO. H. MUMFORD,
Vice-President.

EXECUTIVE OFFICE,
NEW YORK, April 30, 1873.

In the list of new transfer offices in D. H. Bates' District, given in the last JOURNAL, for Morristown, Pa., read Morristown, N. J.

G. H. MUMFORD,
Vice-Prest.

THE SECRETARY OF THE TREASURY IN REGARD TO DUTIES ON OCEAN CABLES.

Mr. Orton, President of the Western Union Telegraph Company, having requested certain privileges in the matter of the new cable on the Kangaroo, Secretary Richardson has written Collector Arthur as follows:

"In regard to the shore end of the cable, the Department would state that heretofore it has been the practice to allow the free entry of submarine cables intended to bring the United States into communication with foreign countries, and therefore, so far as that is concerned, Mr. Orton's request is hereby granted, and you will be governed accordingly. The previous action of the Department in like cases has not, however, included the exemption from duty of the apparatus necessary to work the cable, and the Department is not disposed to set a precedent in this respect. That portion of the application is therefore denied. The remittal of the tonnage tax will be made the subject of another communication."

OWING to press of matter received at a late moment, the acknowledgment of assessments of the Telegrapher's Insurance Association is unavoidably crowded out. It will appear in our next.

BORN.

ALEXANDER.—At Ludington, Mich., April 3, 1873, a daughter to H. F. Alexander, Manager W. U. Tel. Office.

DODD.—At Girard, Kansas, April 6, 1873, a son to George A. Dodd, Manager W. U. Tel. Office.

HUNT.—At Terre Haute, Ind., April 15, 1873, a son to Harry C Hunt, Operator I. and St. L. R. R., Carbon, Ind.

Digitized by Google

FOREIGN TELEGRAPHIC ITEMS

BASIS OF PROPOSED CONSOLIDATION OF THE ATLANTIC CABLE COMPANIES.—The following is the basis proposed for the consolidation of the Anglo-American, French Atlantic, and New York, Newfoundland and London Telegraph Companies:

The capital to be £8,000,000, divided into 800,000 shares, of £10 each, of which 400,000 are to be preference shares, with a dividend of six per cent. per annum, and 400,000 ordinary shares.

The terms upon which it is proposed to exchange the new stock for the existing shares is as follows: For every £100 of Anglo-American stock, £200 of the new, of which ten shares shall be preferred and ten shares ordinary.

For every £20 French Atlantic stock, £40 new—equally divided into preferred and ordinary stock. For every £20 of New York, Newfoundland and London stock, £30 of the new stock, preferred and ordinary in equal amounts.

TERMS OF THE AMALGAMATION OF THE ATLANTIC CABLE COMPANIES.—The respective boards of the Atlantic Telegraph companies have at length agreed upon terms of amalgamation, and the proposal will be submitted at an early date for the sanction of the shareholders. The capital of the amalgamated undertakings will amount to £7,000,000, distributed as follows: To the French Atlantic Telegraph Company £3,450,000, to the Anglo-American Company £2,550,000, and to the New York, Newfoundland and London Company £1,000,000. It will be noticed that the capital is £1,000,000 less than that of the proposed Consolidated Atlantic Telegraphs Company limited. The Newfoundland Company, however, are agitating for better terms.

A dispatch from London, dated the 29th, states that consolidation between these Companies was effected on the 28th.

THE TELEGRAPH IN BRAZIL.—Mr. Charles Burt, the representative of the English Great Western Telegraph Company, is now in Rio Janeiro. This Company owns the Brazilian coast cables concessions, and is intending to lay a cable from Para to Rio Grande do Sul, in the course of the next twelve months, and in connection with the company going to lay the Lisbon and Pernambuco cable. Mr. Burt is effecting some preliminaries with the government, and it is probable that the imperial government will place a war steamer at his disposal for the soundings that have to be made. A slight difficulty exists about a conflict of concession with the Lamas, one for a cable between Rio and the River Plate; but it seems probable that some compromise or amalgamation will be effected.

A CONCESSION has been granted by the Spanish Government, giving certain parties the right to lay lines of telegraph cable from Cuba or Porto Rico to Hayti, in St. Domingo.

AN interim dividend of two per cent. for the quarter ending March 31st, payable May 1, has been declared by the directors of the French Cable Company.

AT a meeting of the directors of the New York, Newfoundland and London Telegraph Company, it was resolved to declare an interim dividend of 10s. per share for the quarter ending March 31st.

THE Emperor of Russia has recently granted to a joint stock company a concession to lay and work a submarine telegraph cable between Odessa and Constantinople.

THE number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended March 19, 1873, was 350,551—an increase on the corresponding week last year of 89,862.

THE TELEGRAPH IN PERU.

Correspondence of the Panama Star and Herald.

LIMA, March 28, 1873.

In one great feature of the general project for internal progress and material advancement, Peru has been singularly unfortunate. Whilst her railways have been approaching a successful completion, her agricultural interests extending in importance every day, her commerce increasing in a wonderful manner for a South American republic, her telegraphic system has failed to achieve its end or perform its duty, and there are probably few civilized countries where so little faith may be placed in the electric medium of conversation. The reason of this misfortune is, at the same time, clear to the unprejudiced observer. The telegraphic lines in Peru extend over barren deserts only traversed by the muleteers and Indians of the coast districts; the distance between the stations are excessive; the necessity for this usually required means of communication is limited, and the enhanced cost of material, the exorbitant salaries paid to the employees, and the continual disasters arising from floods, do not compensate those who have ventured to embark their capital in the enterprise. At first the lines were constructed in the cheapest manner consistent with the expected requirements; afterwards it was found necessary to substitute iron for wooden posts, a considerable expense in itself, and finally the Company recognized the expediency of placing guards along the lines of wire. But even these precautions have proved insufficient against the continued warfare of man and the elements; many, since the uneducated people through whose territory the wires in many instances pass, regarded the innovation as directly against their privileges and interests, and feared that their ancient and profitable employment and couriers would entirely disappear before the strange method employed for conveying intelligence. Hence many cases have occurred when the denizens of these more than rural districts have arisen in their wrath, destroyed the posts, torn down the wires, and intimidated the operators to such a degree that communication has been suspended, for considerable lengths of time, between the most important points of the Republic. The telegraph in Peru is in the hands of a company composed of some of the most energetic men of the country. Their enterprise, vigilance and ability have proved to be unequal to the mode of warfare employed by their enemies. Hardly a day passes but the chief office in Lima receives the unwelcome intelligence of the destruction of a portion of the works by human or superhuman means. In fact things have arrived at such a pass that the Government has seen proper to interfere, and the Minister of Public Works, acting under the instigation of President Pardo, has presented a proposition to Congress to the following effect: "The nation shall become the proprietors of all the telegraph lines in the Republic, after having paid to the company now holding the same a fair and just valuation for the stock on hand, and the undertaking as it stands, covering this value with bonds pledged for the extinction of the internal debt, bearing an interest of 6 per cent. per annum; an authorization to be granted to the Government to continue the line from Pisco to Iquique, thereby perfecting the electric communication from the last named port to Payta, a distance overland of more than one thousand miles; and furthermore soliciting the permission of Congress the guarantee and interest of 5 per cent. on the sum of 1,500,000 soles, which is estimated for the successful submersion of a cable from Payta to Panama." The advantages of the scheme are so obvious, and the profitable results to be deprived from its accomplishment by commercial circles are so readily comprehended, that Congress very favorably received the indication of the Executive, and we have reason to believe that the resolution of the legislative body will harmonize with the desires of the President and his immediate counsellors.

At present Peru boasts of nearly 1,000 miles of telegraph in actual use, but which, under the administrative measures now in force, do but little more than cover working expenses. The Government, basing its ideas on the happy results obtained by our neighbor Chili, and the striking example of Great Britain, will bravely undertake the experiment, provided it may be possible to secure the consent of Congress, which, as I have already stated, appears to be more than probable.

DETAIL OF THE ESTIMATE FOR THE BRITISH TELEGRAPH SERVICE.

The increasing work of the Telegraph Department causes an increasing amount of working expenditure. The estimate for the financial year 1873–74 is 815,000*l.* When the Civil Service Estimates were presented to Parliament on the 27th of February, this particular estimate had not been submitted to the Treasury; it arrived there, however, on the next day, and is printed in the volume of Civil Service Estimates; but, unfortunately, it was impossible to subject it to previous examination by the Treasury. The department being so new, some account of the expenditure will be acceptable. A sum of 46,646*l.* is required for the Secretary's office and account departments, in which there are upwards of 400 officers employed; the amount includes 300*l.* a year for the Second Secretary to the Post-Office, Mr. Scudamore, who has a salary of 1,500*l.* a year from that department. The sum of 175,412*l.* is required for "the maintenance of the telegraph system;" under this term are included the salaries of 656 officers in the engineers' offices and the factories, 12,000*l.* for traveling, 24,000*l.* for materials and carriage, and 33,000*l.* for maintenance by railway companies. The total of this item is 42,870*l.* more than was voted for it last session. A sum of 15,000*l.* is required for remuneration of railway companies for the transaction of telegraph business at their stations on behalf of the Postmaster-General. Three great items for salaries and expenses follow—87,908*l.* for the central telegraph station in London, with its 1,530 officers; 60,671*l.* for the district and branch post-offices in London; and 373,412*l.* for provincial post-offices; the increase on the three items amounting to 95,129*l.* There is also required 6,325*l.* for the special staff of 18 officers for special occasions, when the ordinary force of the department is unequal to the sudden pressure of work; the item includes traveling expenses and rent of offices at race-courses. For telegraphic instruction there is to be a vote of 1,726*l.*; for superanuations and gratuities, 400*l.*; for repairs of buildings and furniture, 15,000*l.* One more item of 32,500*l.* includes three sums—13,000*l.* for uniform dress, or, at all events, pouch and bag, for the 6,458 messengers and linemen; 16,500*l.* for stationery, inks and small stores at stations, and 3,000*l.* for poundage on sale of postage stamps used for telegrams. The department gives employment to a large number of female clerks. At the central telegraph station in London there are about 700. They do no night duty nor Sunday duty. Four of them receive salaries commencing at 160*l.* a year, and rising gradually to 200*l.* a year, and six others from 120*l.* to 150*l.*, and there is a matron with a salary commencing at 150*l.* and rising to 250*l.* a year. There is a medical officer for that station with a salary of 800*l.*, calculated at 10s. for each person, including medicine.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, MAY 1, 1873.

INCREASE IN ATLANTIC CABLE RATES.

In consequence of the interruption of two of the Atlantic cables the decrease in rates, which was announced as to go into effect May 1st, will not take place. On and after that date, from New York City, the New England States, and the British Provinces, to Great Britain and Ireland, the rate per word will be one dollar and fifty cents. The tariff to France will be estimated upon a minimum of ten words, fifteen dollars, and one dollar and fifty cents for each word over ten. To this must be added the continental rate from London to France, one dollar and twenty-five cents for twenty words, and half of that rate for every ten or fraction of ten in addition.

The rates from all other offices in the United States are proportionately increased by this advance.

TELEGRAPH ESTABLISHED BETWEEN SAVANNAH AND TYBEE ISLAND, GA.

A line of telegraph has recently been completed by the Tybee Telegraph Company, between the City of Savannah (Ga.) and Tybee Island, at the mouth of the Savannah River, which is designed for the convenience of the shipping interests of that port. This connection meets a want long experienced, communication having heretofore been maintained by the uncertain and slow methods in use by the original settlers. The Company has constructed a comfortable house on the northeastern shore of the island, immediately in front of the Lighthouse and opposite to the bar of the river, and is supplied with thermometrical and signal apparatus, telescopes, &c., for reporting weather, and signalizing and sighting vessels. The office is distinguished by the American and the Company's flags flying from large flag-staffs immediately in front of the office.

The line connects with the Western Union at Savannah.

Gen. T. T. Eckert, of the Western Union Commission to Europe, arrived yesterday on the *Scotia*, from Liverpool. He is in excellent health.

THE POSTAL TELEGRAPH SCANDAL.

The British public continue to be considerably exercised over the revelations of the Committee appointed by the House of Commons to investigate the proceedings of the Post Office Department. Apparently losing sight of the false step, the taking of which was the direct cause of the systematic deceptions now brought to light, the English papers, with a singular unanimity, confine their comments upon the report of the Committee and the testimony of Mr. Scudamore, to condemnation of the course of the Post Office authorities in appropriating certain funds, held in trust, to an illegitimate, yet, they are careful to state, not dishonest use. As the London *Times* remarks :

"It is easy to understand how such transactions arose, and to see that they were prompted by creditable but mistaken motives."

The *Economist* says :

"Mr. Scudamore had to make and work the telegraphs—and what was he to do."

The line is drawn exceedingly fine. Mr. Scudamore had not to make the telegraphs. They existed, efficient to a degree not since exceeded, when Mr. Scudamore with his mistaken conclusions induced the Government to acquire their control. The present scandal is the result of a false idea of political economy to which the British Government became committed by the bad counsels which it accepted.

With the financial morality of these transactions we have no concern, but in view of the persistent endeavors made heretofore, and threatened for the future, by politicians, lobbyists, and official speculators in the United States, in their greed for power and wealth, to fasten upon us a similar burden, the exposure is timely, and withal so complete that a blunder in this direction will now be a crime.

In the United States to-day there exists about 85,000 miles of lines. When it is considered that 23,000 miles of lines in Great Britain has cost the Government of that country $56,000,000, where there was the greatest inducement for rigid economy in expenditure, an idea can be arrived at concerning the actual amount which our Government would have to expend, if, at a fair valuation, it acquired possession of the American system.

We are hopeful that with the bursting of this bubble, the last has been heard, for a generation at least, of our Government entering into business which legitimately belongs to and is best promoted by private corporations. If, however, at any time it should be necessary to the welfare of the country that the Government should possess the telegraph lines, let it be done understandingly. Elaborate disquisitions, lacking in degree the essential element of truth, and bolstered up by false estimates, can no longer be palmed off as facts upon a Congress ignorant of the true condition and nature of the subject.

TELEGRAPHIC COMMUNICATION WITH CUBA RESTORED.—The cable from Key West, Fla., to Havana, Cuba, has been repaired, and business is now sent direct.

THE NEW CABLE TO BE LAID TO HEARTS CONTENT INSTEAD OF HALIFAX.

We learn, on good authority, that the announcement of the amalgamation of the Anglo-American French Cable and the New York, Newfoundland and London Telegraph Companies is a fixed fact. The first result of this arrangement will be the laying of a third cable between Valentia and Hearts Content, and it is probable that a portion of the cable now being put into the Great Eastern will be used for that purpose instead of, as intended originally, being laid to Halifax. The Consolidated Companies contemplate the furnishing this summer of additional wires over the other sections of the route.

It is stated that in view of this decision the *Kangaroo*, which recently laid at Halifax and New York the shore ends of the new cable, will pick them up and return home.

TREASURER'S OFFICE,
WESTERN UNION TELEGRAPH COMPANY.
NEW YORK, April 30, 1873.

To all Managers of Offices :

Your attention is particularly requested to the following circular. This act of Congress makes it necessary to exercise great caution in accepting any gold coin which shows the least sign of abrasion.

R. H. ROCHESTER,
Treasurer.

STANDARD WEIGHT, LEGAL LIMIT OF ABRASION, AND LEAST CURRENT WEIGHT OF UNITED STATES GOLD COIN.

TREASURY DEPARTMENT,
OFFICE OF THE DIRECTOR OF THE MINT,
WASHINGTON, D. C., April 1, 1873.

Section 14 of the Coinage Act of 1873 provides that gold coins which have become reduced in weight by natural abrasion not more than one-half of one per centum below the standard weight, after a period of circulation of twenty years, and a proportionate rate for a less period, shall be received at their nominal value at the United States Treasury and its offices.

The following tables exhibit the standard weight, legal limit of abrasion, and least current weight of single pieces, and sums of $100, $500, $1,000 and $5,000 United States gold coin (excluding the dollar), under the act referred to :

Statements exhibiting the Standard Weight, Legal Limit of Abrasion, and Least Current Weight of United States Gold Coin after a circulation of twenty years, under the provisions of the Coinage Act of 1873.

WEIGHT OF SINGLE PIECES.

Denomination.	Standard weight, in grains.	½ per cent. abrasion, in grains.	Least current weight in grains.
Double Eagle	516	$2\frac{58}{100}$	$513\frac{42}{100}$
Eagle	258	$1\frac{29}{100}$	$256\frac{71}{100}$
Half Eagle	129	$0\frac{64}{100}$	$128\frac{36}{100}$
Three-Dollar	77.4	$0\frac{38}{100}$	$77\frac{02}{100}$
Quarter Eagle	64.5	$0\frac{32}{100}$	$64\frac{18}{100}$
Dollar	25.8	$0\frac{13}{100}$	$25\frac{67}{100}$

The legal deviation from the standard weight on the gold dollar being one-quarter of a grain, it will continue current until reduced in weight below $25\frac{55}{100}$ grains.

THE TELEGRAPH IN EUROPE.—LETTER FROM MR. GEORGE B. PRESCOTT.

BERLIN, April 10, 1873.

MY DEAR SIR: By far the most systematic and best appointed telegraph that we have seen yet is the Prussian, or the German, for all the lines in the empire are now worked as one system. Here everything pertaining to the telegraph is as systematically arranged as in a well appointed army. The Director-General, Col. Meydam, is a splendid-looking officer, of dignified and commanding presence, and I should think, about forty years old. He received us with the utmost cordiality, and personally showed us for two days over the Central establishment. To-day we are to see the auxiliary offices, and dine with him and some other guests at his house. The Prussian system embraces about 60,000 miles of wire, and is managed under Col. Meydam, the Director-General, by twelve Directors situated at convenient points. Everything in each district is completely under the control of the Director of the District, and the Director-General issues his orders only to the Directors. Messages are paid by stamps, and no record or copy is made of them. Number lists are printed very much like ours, and every morning each office commences numbering by checking each number on the list as messages are received from the customers. These number sheets, and the original messages duly stamped and defaced by making a diagonal line across the face of the stamp with a pen and black ink, are sent each day to the auditor, who sees that the numbers correspond, and who causes another line in red ink to be made across the face of the stamp. This constitutes the whole auditing machinery. The affixing and defacing of the stamp shows that the department has been paid for sending the message. All the messages in each department are retained in the various offices, and the Directors from time to time visit the offices, or send clerks to visit them and see that the messages correspond with the number sheets, and that they are all duly stamped. Messages going to other lines upon which amounts have to be paid, are recorded in a book in substantially the same manner as ours, but the great bulk of the business is done by stamps. The cost of the stamps is seventy cents for 5,000. The battery used is similar to Phelps' make of the gravity or Callaud battery. The cost of the battery for the Prussian lines is $15,000 per year. They work about five wires out of each battery. In charging the battery only one ounce of blue vitriol is used. The relays have a resistance of 700 ohms, or five times as much as ours. This admits of their being worked with a very much smaller battery power, and consequently at very much less cost. The railroads have their own wires—three wires for each road—and they are worked independently of the government system. Where there are small offices, a constant or closed circuit system is employed like ours, but between all the larger offices they employ the open circuit system, which again makes a great saving in the battery. The insulation in Prussia is the white porcelain on a curved iron shank, which is screwed into the pole. In France white porcelain is employed also, but of a different pattern, the porcelain being fastened to the pole by screws. And in Belgium the white porcelain is fastened to the pole by an iron band near the top of the insulator. The underground lines in Prussia are laid down in a much less expensive manner than England. Seven gutta-percha wires are made into a cable and covered with iron wires. A trench is dug about four feet deep—below frost—and the cables are placed in it and pocketed with brick to prevent injury by the tools of workmen who might chance to dig down for laying gas-pipes or other purposes. In England the wires are enclosed in iron tubes or pipes. In Paris the subterranean wires are made into cables, covered simply with canvas and carried through the sewers. Col. Meydam says the underground wires give them very little trouble. Some of them have been laid down for over fifteen years. We saw the great Indo-European line in operation yesterday from London to Teheran, a distance of 4,000 miles. There were four repeaters in circuit, and the speed was 8½ words per minute. They said they could work faster, but there was not business enough to require it. We saw Siemens' automatic system in operation for sending weather reports. They do not employ the automatic system for sending ordinary messages. The Hughes instrument is employed upon all the great lines, and it performs the bulk of the service in continental Europe. It works rather more than half as fast as the Phelps, and is a valuable instrument. Col. Meydam has received the Stearns Duplex, but has not set it up. I shall offer to do it for him to-day in return for his attention to us. I shall probably leave here for Vienna on Monday. We spent one day at Siemens' factory and got many valuable ideas. We are all well, and are enjoying the trip very much, but are anxious to return as soon as possible. Were not sick in crossing the Channel.

GEO. B. PRESCOTT.

Hon. WILLIAM ORTON, *President.*

THE FRENCH ATLANTIC CABLE BROKEN.—The French Atlantic telegraph cable is broken, and there is now but one cable working to Europe. The electricians of the Company locate the break at a distance of two hundred and thirty miles from Brest.

Mr. H. HIGHTON, in a letter to the London *News* relating to the recent break in the Atlantic cable of 1865, makes the assertion that the wit of man could not have devised a better way than that in which the sheath of the Atlantic cable was constructed to secure its speedy destruction by rot. The sheath was formed of hempen cords, each with an iron wire in the middle. If a tablecloth is hung out on an iron wire to dry, as everybody knows, there will soon be a hole wherever the cloth has touched the wire. Mr. Highton reasons that in some parts of the Atlantic, at least, the iron wire in the cable sheath is likely to rust; the rust destroys the hemp; and then, the iron and hemp both gone, the core of copper and gutta percha will break from the slightest cause. This view of the subject has brought out several letters in which the position of Mr. Highton is strongly assailed; but he has retorted with the recital of two facts which are worth any number of unsupported theories. One of these facts is that a gentleman has brought him a piece of cable constructed on the plan he considers so faulty, which was picked up accidentally while dredging in eleven hundred fathoms of water in the Mediterranean. It had been down for ten years, and was quite rotten. The iron wires were rusted through, they had destroyed the hemp about them, and their fragments were sticking out like rusty needles. The other fact cited is that some years ago the West India Dock Company, in order to strengthen the hempen cables they used about their docks, tried the use of iron wires inside. The result was the iron wire and hemp destroyed each other in a few months. The importance of this subject, when the enormous cost of a telegraph cable stretching from one continent to another is considered, must be apparent to every one. Mr. Highton has a plan by which he thinks seven cables of an improved construction can be laid at the cost of one of the present ones, but he does not explain what that plan is.

THE SHORE ENDS OF THE NEW FRENCH ATLANTIC CABLE LAID.

The steamer Kangaroo, which has been laying the shore ends of the new Atlantic cable, left her moorings off Rockaway Beach on Saturday morning, and steamed to New York. The vessel has laid two shore ends of cable at Halifax, one pointing towards New York and one to be united with the main cable from England. The shore end of the main cable was laid from the cable-house at Freshwater, Halifax, to point about twenty miles distant, off Chebucto Head. It was there buoyed up to await the arrival of the Great Eastern, which is to lay the cable from Land's End, Cornwall, England, to Halifax. The other section of the cable will run, if there be no change of programme, from Halifax to a point on the south side of Long Island, opposite Hog Island, and about five miles from Far Rockaway. The end at Halifax which is to connect with Long Island was laid by the Kangaroo from Point Pleasant outward for ten miles, and there buoyed. After the connection of the other Halifax end with the main line, that section will be joined to the Long Island end. On Thursday afternoon the Kangaroo arrived off Hog Island, and, wind and tide being favorable, it was determined to proceed at once to land the cable. The cable was cut, placed upon an improvised barge, and gradually paid out as the barge was towed ashore. A coil of about 500 yards remaining, it was deposited on the beach and secured by piles, as it will be stretched along the beach and finally connected with a cable at Pearsall's Corners, which proceeds to Brooklyn.

THE ADVANCE IN CABLE RATES EXPLAINED.

President Orton, of the Western Union Telegraph Company, deprecates the statement made in several of the newspapers, that the recent advance in rates for ocean telegraphing was for the purpose of increasing the revenue of the companies. Recently there were three cables, now there is only one, in working order. The unimpaired cable has been taxed to its utmost capacity with business formerly divided among the three lines, and although every effort is made, the present line is falling behind, and dispatches sent over it will soon be practically valueless. It was with the view of compelling customers to withold their business, as far as possible, until additional facilities were afforded, that the rates were advanced. President Orton says that one of the impaired cables will probably be regained, and placed in working order as soon as the weather is favorable. There may be some doubt as to the other cable, which has probably suffered from corrosion.—*New York Tribune, 28th.*

THE NEW CABLE SHIP.—The largest vessel ever built on the Tyne was launched from Mitchell's yard, Newcastle, on March 29. She is intended for the laying of transatlantic cables for the Western Telegraph. She is 5,000 tons register, and has a carrying capacity larger than that of any vessel afloat except the Great Eastern. The whole available length of the ship is divided into three tanks for the storing of cables. Only four months and a half were occupied in her construction. At a banquet held in the evening, at which Mr. Hooper, the Chairman of the Telegraph Company, and Sir W. Thompson were present, it was stated by the latter that the object of the Company was to convey transatlantic messages at the same rates as those for which letters are carried. They hoped, indeed, to fix a tariff at as low a rate as a penny.

Mr. D. Van Nostrand advertises, on page 171, the new English periodical, The Telegraphic Journal and Electrical Review.

LIABILITY OF TELEGRAPH COMPANIES.

IMPORTANT LEGAL DECISION—NO RESPONSIBILITY FOR DISPATCHES NOT INSURED OR REPEATED.

The Supreme Court of Massachusetts has recently sustained the validity of the blanks used by telegraph companies, in an action brought to recover damages for the non-delivery of an unrepeated day-message, written upon the usual blank of the Western Union Telegraph Company. Redpath & Fall, proprietors of the Lecture Bureau, Boston, in response to a message from Rochester asking if they could send a lecturer to supply the place of Robert Collyer, telegraphed that they recommended the Hon. William Parsons, who would lecture for a sum named. Receiving directions by telegram to engage him, they sent a dispatch to him at Owego, N. Y., which dispatch was sent, by a mistake of the operator, to Oswego, N. Y., and was never received by Mr. Parsons, much to his loss as well as to that of the Rochester lecture committee, and to the disappointment of the audience assembled to hear him. The action was brought to recover Mr. Parson's loss of his fee for the lecture, the expenses of the Rochester committee, and the commissions of Redpath & Fall. Chief-Justice Chapman delivered the opinion of the Court, no Judge dissenting; and, after quoting the printed heading on the telegraph blank, held that the message having been neither repeated nor insured, which might have been done at an additional cost, the Company was not liable; and it was immaterial whether the senders read the printed heading or not, so long as they wrote the message under it and signed it, and paid for sending an unrepeated and uninsured dispatch. In the opinion of the Court, the error did not arise from the state of the atmosphere, nor from the imperfection of instruments, nor were the Company guilty of fraud or gross negligence, nor was the error of such a character that the Company could not legally contract for their own protection against liability for it, on such terms as the printed conditions contain. The Judge said, in concluding: "It seems to us that one who elects to save the small sum charged for a more extended liability cannot reasonably claim the benefit of it, in a business where careful operators are so liable to make mistakes." The recognized learning and high character of the Court render this opinion of interest and importance.

THE Executive Mansion of Missouri is said to be so filled with electricity that every one who enters it is terribly shocked. The phenomenon is attributed to the over-charging of the architect who built it.

A PROJECTED GERMAN CABLE.

The *Baltic Gazette* of Stettin, Germany, in a late issue contains the following:

"Since the coming into existence of a direct steam connection between our city and the New World, it is now mooted to have a direct telegraphic connection between here and New York. A German cable is to be laid which shall be under purely German management. The prospects of the project are of the best, and the realization of it is at no distant date.

"A preliminary meeting was held at the Baltic Hotel on the 7th March, which, besides a large number of merchants, ship-owners, &c., was attended by the President of the Admiralty, Von Beüthen; Auditor of the Admiralty, Von Kniffman; Fleet Captain Werding, and Colonel Von Maüthner.

"The Secretary of the Nautical Society, Mr. Ernest Mantel, explained the projected enterprise and demonstrated clearly its financial success.

"The cable has been undertaken by the resident firm of Schlipmann & Schindler. It will be laid from here to a northerly point in the Shetland Islands and thence direct to Port Mergin, Newfoundland, and will be put in direct connection with New York by the land lines. The management in New York is German, so that from here, as also from New York, German messages can be sent direct. There is every probability that this undertaking will be finished by the 1st October of this year."

The Amateur's Telegraph Apparatus.

(PATENTED APRIL 16TH, 1872.

This is no toy, but a *bona fide* Telegraph Instrument, with a full-sized trunnion lever Key, with friction Circuit Closer and a Pony Sounder, both on same base.

The battery used is Hill's Patent Gravity Battery, which is considered to be the most constant and economical Telegraph Battery in use. A small size is made expressly for the above apparatus.

With each Instrument is furnished:

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners.

This is sufficient outfit for the student; and all can be set upon a table, or the battery can be set upon a shelf near the table.

In operating a short line, there will only be required, in addition to the above, more cups of battery, according to the length of line.

A Complete Outfit for a Telegraph Office,

WITH BOOK OF INSTRUCTION,

FOR

Seven Dollars and Fifty Cents.

GEO. H. BLISS & CO., Sole Agents,

Specially adapted to Railroad Signals, Printing Instruments, etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country having proven the cheapest, and least trouble to maintain of any in the market.

Patented Dec. 31, 1872.

ALSO, SOLE MANUFACTURERS OF THE

Patent Circuit Closer Key,
O'Sullivan Self-closing Key,
Scott's Patent Hotel Annunciator

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE

PATENT BATTERY INSULATOR

shown, holding a cup of the Baltimore Battery in the above cut, which most effectually insulates the Battery as the drip passes off *through a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. PRESCOTT, says of it:—"I think your Battery Insulator is very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

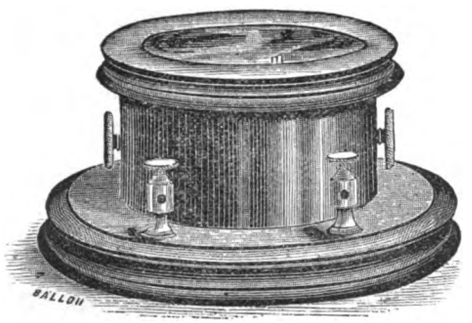
Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.

Repairers' Tools constantly on hand.

Importers and Dealers in best English and American Galvanized Wire.

MANIFOLD PAPER, for Train Orders, etc. Also, AGATE PENS.



In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices.

M. A. BUELL,

Manufacturer and Dealer in

TELEGRAPH SUPPLIES.

THE LITTLE MONITOR RELAY

Is a substantially made and good working Instrument, incased in a polished Rubber Cylinder with Plate Glass Cover, has back and front Adjustment.

EVERY INSTRUMENT WARRANTED.

Price, $12.00.

Also, LITTLE MONITOR SOUNDER, to match,
Price, $6.00.

And Small Size W. U. KEY,
Price, $4.00.

All kinds of Learner's Instruments, with Instructions, constantly on hand. Send for Circular.

M. A. BUELL,
26 WARING BLOCK,
CLEVELAND, O.

WASHINGTON TELEGRAPH AGENCY,

For the transaction of all business pertaining to

Telegraph and Electrical Matters,

and for the sale of

TELEGRAPH SUPPLIES

OF EVERY DESCRIPTION.

Special attention given to the examination of

PATENT CASES

and the collection of

GOVERNMENT ACCOUNTS.

GEO. C. MAYNARD,
1711 G. St., Washington, D.C.

SPECIAL NOTICE!

For the purpose of diffusing useful knowledge, we make the proposition to all Telegraph Superintendents to communicate to us the address of such Operators employed on their respective lines as in their judgment would feel gratified by the

PRESENTATION OF

SMITH'S MANUAL OF TELEGRAPHY,

and we will forward to each address so furnished a copy of that work FREE OF CHARGE, upon any application received during the ensuing SIXTY DAYS.

THE LECLANCHE BATTERY.

This Battery (the invention of GEORGE B. LECLANCHE of Paris) possesses great advantages over any other now in use, in its *great endurance*, its *cleanliness*, its *economy* and its *simplicity*.

We have now perfected arrangements by which we shall at all times be able to supply the rapidly increasing demand in this country.

PRICES:

No. 1, per cell,	*$2.25*
" 2, "	*1.80*
" 3, "	*1.75*

Manufacturers and Dealers in

Telegraph Instruments and Supplies

OF EVERY DESCRIPTION,

38 Vesey Street, New York.

New and Superior patterns of

STANDARD TELEGRAPH INSTRUMENTS.

Their RELAYS, SOUNDERS, and KEYS which have been specially designed by Mr. F. L. Pope, are elegantly designed, thoroughly well finished and scientifically adapted to the service required and are recommended as SUPERIOR TO ANY HITHERTO OFFERED.

In addition to these ALL DESCRIPTIONS OF TELEGRAPH MATERIALS AND SUPPLIES are furnished, such as

INSULATORS, BATTERIES,
INSULATED WIRES,
CHEMICALS., ETC. ETC.

MAGNETIC AND DIAL INSTRUMENTS.

We have for sale also THE NONPAREIL TELEGRAPH INSTRUMENT for amateurs, learners and short lines.

A COMBINATION SET, comprising Sounder and Key on a handsome rosewood base.

Bradley's Box Relays and Sounders.
Bradley's Apparatus for Electrical Measurement.
Bradley's Naked Wire Helices and Magnet Spools to order, any desired size and resistance, at manufacturers' lowest price.

Descriptive Circular and Price Lists forwarded upon application to

F. L. POPE & CO.,

THE LECLANCHE BATTERY CO.

Is now prepared to supply promptly the increasing demand for

This Celebrated Battery,

(SECURED BY LETTERS PATENT IN THIS COUNTRY)

and which is extensively used throughout Europe for

TELEGRAPHY,
RAILROAD SIGNALS,
HOTEL ANNUNCIATORS,
BELLS, ETC.

Among the numerous advantages of this Battery may be mentioned—

ENTIRE ABSENCE OF ACIDS,
ITS GREAT CLEANLINESS,
WONDERFUL DURABILITY,
GREAT ECONOMY IN RUNNING EXPENSES.

This Battery will last, without any Attention, from six months to a year.

A number of cups have been in use by the Western Union Telegraph Company, *on a closed circuit*, since Nov. 26, 1872, nothing but water having been added since they were first set up.

For further particulars apply to

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 12. NEW YORK, MAY 15, 1873. WHOLE NO. 133.

ELECTRICAL DENSITY AND DISTRIBUTION.

By the average electrical density on the whole or any specified portion of the surface of a conductor, is meant the quantity of electricity upon it, divided by its area. By the electrical density at a specified point on the surface of a conductor is meant the average electrical density on an exceedingly small area surrounding it; in other words, the quantity of electricity per unit area at the point. The name is appropriate, from the analogy of ordinary material density, which is mass per unit volume, and is not intended to imply any hypothesis as to the nature of electricity. The name was introduced by Coulomb, who first investigated the subject in question, and is generally employed by the best electricians in this country. The term thickness of electrical stratum, which was introduced by Poisson, is much used in France, but is more open to objection from the coarse assumptions which it seems to involve.

The following are some of Coulomb's results. The dotted line in each of the figures is intended to represent, by its distance from the outline of the conductor, the electric density at each point of the latter. In all cases it is to be understood that the conductor is so far removed from external bodies as not to be influenced by them :

1. Sphere (Fig. 1). The electric density is the same for all points on the surface of a spherical conductor.

2. Ellipsoid (Fig 2). The density is greatest at the ends of the longest, and least at the ends of the shortest axis ; and the densities at these points are simply proportional to the axes themselves. More generally, however, the density at any point on the surface of an ellipsoid is proportional to the length of a perpendicular from the centre of the ellipsoid on a tangent plane at the point. If an ellipsoid, similar and nearly equal to the given one, be placed so that the corresponding axes of the two are coincident, we shall have a thin ellipsoidal shell, whose thickness at any point exactly represents the electric density at that point. Such a shell, if composed of homogeneous matter attracting inversely as the square of the distance, would exercise no force at points in its interior.

3. Flat Disc (Fig. 3). The density is almost inappreciable over the whole of both faces, except close to the edges, where it increases almost per saltum.

4. Cylinder with Hemispherical Ends (Fig. 4). The density is a minimum, and nearly uniform at parts remote from the ends, and attains a maximum at the ends. The ratio of the density at the ends to that at the sides increases as the radius of the cylinder diminishes, the length of the cylinder remaining the same.

In the case of equal spheres in contact, the charge, which is nothing at the point of contact, and very feeble up to 30° from that point, increases very rapidly from 30° to 60°, less rapidly from 60° to 90°, and almost insensibly from 90° to 180°. When the spheres are of unequal size, the charge at any point on the smaller sphere is greater than at the corresponding point on the larger one ; and as the smaller sphere is continually diminished, the other remaining the same, the ratio of the densities at the extremities of the line of centres tends to become 2: 1.

The preceding results were obtained by Coulomb in the following manner. He touched the electrified

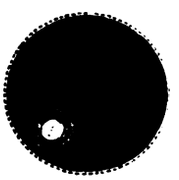

Fig. 1.

body at a known point with the proof-plane, and then put the plane in the place of the fixed ball of the torsion-balance, the movable ball having previously been charged with electricity of the same sign. Repulsion was thus produced, and the amount of torsion necessary to keep the balls at a certain distance asunder was observed. He then repeated the experiment with electricity taken from a different point of

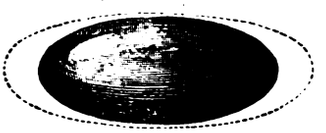

Fig. 2.

the body under examination, and the ratio of the densities at the two points was given by the ratio of the torsions necessary to keep the balls at the same distance.

By way of checking the accuracy of this mode of experimentation, Coulomb electrified an insulated sphere and measured the electric density on its surface by the method described above. He then

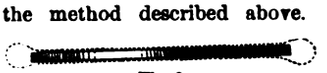

Fig. 3.

touched the sphere with another precisely equal sphere, and on again applying the proof-plane he found that the charge carried off by the plane was just half what it had been before.

The above experiments naturally require some time, during which the body under investigation is gradually losing its charge. The consequence is, that the densities indicated by the balance, if taken

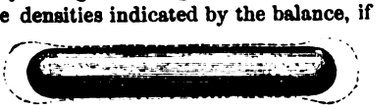

Fig. 4.

singly, do not correctly represent the electric distribution. This source of error was avoided by Coulomb in the following manner. He touched two points on the body successively, and determined the electric density at each ; and then, after an interval equal to that between the two experiments, he touched the first point again and obtained a second measure of its density, which was less than the first, on account of the dissipation of electricity. If the densities thus observed be denoted by A and A′, and the density observed at the second point by B, it is evident that $\frac{A}{B}$ is greater, and $\frac{A'}{B}$ less than the ratio required. Coulomb adopted, as their correct value, their arithmetic mean $\frac{1}{2}\frac{A+A'}{B}$.

The distribution of electricity on a conductor of any form may be roughly described by saying that the density is greatest on those parts of the surface which project most, or which have the sharpest convexity, and that in depressions or concavities it is small or altogether insensible. Theory shows that at a perfectly sharp edge, such, for example, as is formed by two planes meeting at any angle, however obtuse, but not rounded off, the density must be infinite, and *a fortiori* it must be infinite at a perfectly sharp point, for example at the apex of a cone, however obtuse, if not rounded off. Practically, the points and edges of bodies are always rounded off ; the microscope shows them merely as places of very sharp convexity (that is, of very small radius of curvature), and hence the electric density at those places is really finite ; but it is exceedingly great in comparison with the density at other parts, and this is especially true of very acute points, such as the point of a fine needle. The consequence is, that if a pointed conductor is insulated and charged, the concentration of a large amount of repulsive force within an exceedingly small area produces very rapid escape of electricity at the points. Conductors intended to retain a charge of electricity must have no points or edges, and must be very smooth. If of considerable length in proportion to their breadth, they are usually made to terminate in large knobs.

When an insulated conductor is charged and left to itself, its charge is gradually dissipated, and at length completely disappears. This loss takes place partly through the supports, and partly through the air.

As regards the supports, the loss occurs chiefly at their surface, especially if (as is usually the case) they are not perfectly dry. It is diminished by diminishing their perimeter, and by increasing their length ; for example, a long fibre of glass or raw silk is an excellent insulator.

As regards the air, we must distinguish between conduction and convection. Moist air, and highly rarified air probably act as conductors ; but with air that is relatively dry, the loss is probably chiefly due to contact and convection. Successive layers of air become electrified by contact with the conductor, and are then repelled, carrying off the electricity which they have acquired. It is by an action of this kind that electricity escapes into the air from points, as is proved by the wind which passes off from them. Particles of dust present in the air, in like manner, act as carriers, being attracted to the conductor, charged by contact with it, and then repelled. They also frequently adhere by one end to the conductor,

Digitized by Google

and thus constitute pointed projections through which electricity is discharged into the air.

Coulomb deduced from his observations on dissipation of charge, a law precisely analogous to Newton's law of cooling, namely, that when all other circumstances remain the same, *the rate of loss is simply proportional to the charge*, so that the charges at equal intervals of time form a decreasing geometric series. Subsequent experience has confirmed this law, as approximately true for moderate charges of the same sign. Negative charges are, however, dissipated more rapidly than positive.

A NEW ELECTRIC LIGHT.

[From the London Standard, April 9.]

The York road, Lambeth, is not precisely the place from which one would expect a new light to shine forth upon the world, but yesterday evening no sooner had the sun disappeared sufficiently far below the horizon than passers by were astonished by having thrown upon them a glare of light as white as that of the moon, and apparently almost as intense as that of the solar sphere. Following up the light as it poured down a side street, one came to the gate of an engineering factory, just within the limits of which stood the apparatus whence the brilliant rays streamed. To all intents and purposes the light seemed that of an ordinary electric machine greatly intensified. There were the wires bringing and carrying off the current; there was the concave reflector and there were the bits of square coke which act as wicks or poles. But every one who is accustomed to judge of the intensity or the illuminating power of the electric light must have seen that the relative proportions were those of Venus, or at least Jupiter, to an asteroid. Inquiry was not courted, but information was not refused; and it turned out that this light, wasting its glories on a Lambeth lane, is one of the chief scientific achievements of the last two or three years. A number of gentlemen and a few ladies were present by private invitation to witness the demonstration of the powers of this new arrangement of electric power which, there seems to be little doubt, has overcome all, or nearly all, the technical difficulties that have stood in the way of utilizing electricity both for lighting and for heating. Indeed, one may almost say that the problem has been solved—how to produce cheap electricity. Some of the most eminent of our men of science are said to have examined the apparatus and to have declared the results far beyond any hitherto achieved. The light thrown from half-inch carbon points into the York road last night was fully equal to that of 7,000 candles, and we are informed that a light equivalent to 10,000 or even 14,000 candles has been produced. But the great value of the light is that it is constant. The current is absolutely unintermittent. The machine acts without a commutator, and consequently there is not only no intermission, but there is no variation. What the light is at the end of the first five minutes it is at the end of the hour, or so long as the carbon points remain unconsumed, and the process of the production of the current is so simple that it is marvelous that it has not been before discovered. Two or two-and-a-half-horse power are ample to produce the rotation of three bobbins or broad-edged discs covered with copper wire, and acting upon six pairs of soft iron parallel bars, similarly covered. Magnets are entirely dispensed with in the production of the power, which is derived altogether from friction, there being no battery brought into the circuit in any shape or form. The amount of the electrical current of the machine at work last night was estimated as equal to that of 500 Bunsen's cells, and the inventor is now making a larger one to equal 1,000 of the same cells, for the purpose of performing at a rapid rate some of the most important operations of manufacturing chemistry. Thus he proposes to produce chemically pure copper, which is now worth from three to four shillings a pound, at the cost of ordinary commercial copper; potassium and sodium at less than half their present price; alluminum, now at seventy-five shillings per pound, at thirty or thirty-five, and magnesium, calcium and other rare metals at prices which will bring them into commercial use. But even in its application to the purification of iron alone there would seem to be an immense field for the use of electricity, the inventor of this machine having the courage to declare that he will purify two tons of pig-iron from phosphorus, sulphur, carbon and silica in eighteen to twenty minutes, at a saving of two-thirds of the coal. On this point no opinion can be expressed, but everything seen last night certainly tends to the probability of such a triumph. Thus a platinum wire of about eighteen gauge was melted in forty seconds, and a copper wire in less than two. A piece of solid steel screw, four or five inches long, was burnt away in about five minutes, and a piece of diamond has been vaporized in a few seconds. So constant is the current, that one of these machines, experimentally supplied to the Telegraph Department, has been for some time creating the power by which the whole of the London district wires are worked. Last night, in the works of Messrs. Whieldon, Lecky & Co., engineers, though a machine shop full of benches and tools is not precisely the place most favorable to scientific demonstration, those who were present by invitation or accident saw enough to convince them of the very great future before this machine, which, so far back as July, 1871, received the marked approval of the Academy of Sciences in Paris. It is understood that the light—which last night, with only a strength of three or four thousand candles from small points in the interior of the works, made a jet of gas throw a distinct though ghostlike shadow on a whitewashed wall—will be publicly exhibited soon after Easter in London, as well as in the Vienna Exhibition, where it will be tested thoroughly under the personal superintendence of its inventor, M. Gramme.

OZONE.—Knowing as we do that electric currents passed through air generate Ozone; that variations in the electrical condition of the atmosphere, accompanied by discharges, are continually occurring; that storms, showers, lightning, waterspouts, hurricanes, etc., are all concerned in furnishing the air with a principle which gives it chemical activity; that Ozone is produced during slow oxidations at ordinary temperatures (which processes are incessantly carried on around us); and that papers uninfluenced by any other known agent undergo the same changes when exposed to the atmosphere as those which are effected in them by air artificially ozonized; we are undoubtedly justified in coming to the conclusion that some good grounds have existed for the belief in the existence of Ozone in the atmosphere. Only very recently, however, has our knowledge concerning this body been sufficient to enable us to state positively that an affirmative reply should be given to the question with which this section commences. The experiments of Schonbein and other German observers, of Professor Andrews, which have been confirmed and extended by the author, indorsing as they do the prior researches of Houzeau, now place the matter beyond all doubt.—*From Ozone and Antozone, by C. B. Fox.*

ELECTRICITY A MEANS OF DETECTING DEATH.

Dr. Rosenthal, of Vienna, reports a number of cases, and also a series of experiments upon animals, which illustrate the important aid afforded by electricity in furnishing a tolerably certain test for determining death. This sign is the contractility of the muscles in response to the application of the electric stimulus. By the aid of this test, it is affirmed that the diagnosis is rendered easy in cases of suspended animation, arising from apoplexy, suffocation, drowning, etc. It will be found also of practical utility, it is thought, upon the battle-field, and in time of extensive epidemics, when the danger of infection necessitates the speedy burial of the dead. Among the cases quoted is that of a hysterical young woman, aged twenty-four, who had lain for thirty-two hours, evincing during this time most of the ordinary signs of death. Some suspicions having been aroused, however, as to her actual condition, to settle all doubts, it was decided to summon Dr. Rosenthal. He found, upon his arrival, that the face as well as the entire surface of the body exhibited the marble pallor peculiar to the corpse, while the skin was everywhere cool to the touch. Upon raising the eyelids, both the pupils were found to be equally contracted, and showed no appreciable reaction to the influence of light. The upper and lower extremities were relaxed, and when raised, fell like any dead weight. No pulsation of the heart was perceptible to the touch, nor of the radial arteries at the wrist. Upon applying the stethoscope to the heart, however, the room being perfectly quiet, he was able to make out a suppressed, intermittent beat. The thorax, when uncovered, was found to be motionless, but upon carefully watching the abdomen, an exceedingly weak and slow motion could be detected in the lateral walls. The ordinary respiratory murmur was not heard. Dr. Rosenthal now applied his proposed test, and found that the various muscles responded readily to a feeble excitation, so that he was able to give the assurance that the case was one of suspended animation. In accordance with his directions, therefore, heat was applied to the body, and vigorous friction maintained, the result of which was, that at the end of forty-eight hours the woman gradually recovered the power of speech and motion. She stated that during the first part of her lethargy, she was perfectly unconscious, but afterwards overheard distinctly the remarks of those about her, with regard to her death, without the power, however, of being able to make any motion, or emit the least sound.—*Weiner Med. Presse.*

TELEGRAPHIC IMPROVEMENTS IN MEXICO.

In relation to the telegraph in Mexico, the following is contained in President Tejada's inaugural address delivered at the opening of the Mexican Congress, on the 4th of March:

"The great convenience resulting from the extension of telegraph lines has also received careful attention. The improvement of the line to Matamoras, which opens communication from abroad, has been secured. The construction of a telegraph which will put the Capitol of the Republic in communication with the interior, by way of Toluca, Maravatio, and Acambar, has been brought almost to a conclusion. The line connecting Durango with Calchihuites has been purchased. The construction of the telegraph to connect Minatitlan with Tabasco is actively progressing."

A CHINESE junk was recently seized at Hong Kong having on board some stolen telegraphic cable, supposed to be a portion of the great Northern line.

TELEGRAPHIC SIGNALING THROUGH SUBMARINE CABLES.

At a recent meeting of the Institution of Civil Institution of Engineers and Shipbuilders in Scotland, held in the Natural Philosophy class-room of the University of Glasgow, an illustrated lecture was delivered by Sir William Thomson on the above-named subject.

The eminent professor explained and illustrated the method of submarine signalling by using a model cable, the mirror galvanometer, and the syphon recorder in its most recent form. He commenced by referring to Faraday's explanation of what is called the inductive retardation of signals in a submarine cable. The wire constitutes, as it were, the inner coating of a Leyden jar, the gutta percha or india rubber takes the place of the glass, and the water touching the outside of this represents the outside coating of the jar. Faraday showed that if several thousand Leyden jars were distributed along an aerial line of telegraph, each with its inside coating connected with the telegraph wire, and outside coating with the earth, the signals through the line would exhibit exactly the same inductive retardation as those sent through the actual submarine line. Mr. Cromwell Varley had devised a beautiful practical method for realizing this suggestion. He first made condensers of sufficient capacity to represent the submarine line. A dozen or so of these condensers distributed along the line of resistance coils, according to Faraday's rule, gave the electrostatic capacity to which the inductive retardation is due. In these condensers in a moderate compass a large number of sheets of tin-foil, packed closely together with insulating material between them in order, gave, by the great amount of surface thus got, and the thinness of the coating, the enormous amount of electrostatic capacity (*quasi* Leyden jar capacity) which is necessary to represent a few miles of submarine cable. By these condensers, applied properly to resistance coils, Mr. Varley constructs what he calls an artificial line, and such a line was supplied to him by Sir William Thomson, with capacity equal to the French cable, and resistance equal to four times that of the conductor of the cable, that is to say, equal to about 10,000 miles of such a conductor as that of the French cable. The degree of inductive embarassment of the French cable on account of its great strength—about 2,500 miles—is greater than that of any other cable except those between Suez and Aden, and between Aden and Bombay, which in that respect are about equal to the French cable, because, although of shorter length, their conductors are of less weight per mile. Thus the appliances exhibited may be represented as a model of any of these three cables. The signals through this model were shown by means of a mirror galvanometer with the lime-light, throwing an image on a horizontal scale at a distance of nine feet from the mirror. After making simple right and left signals, the lecturer showed that, by pressing down one key on the transmitting instrument, the spot of light was sent slowly to the right or left, reaching an extreme deflection after several seconds of time, and remaining there as long as the key was held down. He then showed a repeated succession of signals to the right and left, groups of these constituting letters. He next explained the essence of submarine telegraphy in making another signal without waiting for the end of the preceding, and the interpreting by eye and memory, when reading from the spot of light, what the complete deflections would have been if they had been made separately. The same signals were shown on the syphon-recorder, an apparatus by which a syphon of very small bore is made to record the signals in ordinary ink on ribbons of paper. It was afterwards shown that in sending direct from the battery, and receiving through a condenser, there was a great quickening of the signals, and the interposing a condenser at the sending end diminished the amount of deflection, but quickened it very considerably. The application of this quickening method on the syphon-recorder has also been shown.

A CRUEL JOKE.

Yesterday evening a gentleman called at *The Express* office to say that a report was current that a servant woman in the city had drawn the capital prize of $75,000 in the Omaha lottery, the drawing of which took place on Monday. The gentleman asserted that he was not trying to "April fool" any one, and so a reporter was dispatched to learn the truth of the report.

The supposed lucky one lives in a boarding-house on Main street. The reporter succeeded in getting an interview with her. He told her the report in circulation, and asked if it had any foundation. She rummaged in her pocket and brought forth a package of paper, which she unrolled carefully. It enveloped a telegraph dispatch of the Pacific and Atlantic line, which read as follows:

"OMAHA, NEB., April 1, 1873.

"To Miss——— ———, Terre Haute, Ind.:—Ticket No. 466,324 drew the capital prize of $75,000. Answer.

"MAURICE DALE, Head Clerk."

"Now," said the woman, "when I got the dispatch I went to the office to see if there was any joke about it. There was two men in the office, and they both told me that they'd swear that the dispatch came from Omaha just as it reads."

This all looked honest, and the eyes of the reporter glistened with the prospect of a first-class sensation. He asked the woman all about her history. He was rejoiced to learn that she was born in the same township with himself. He spoke in the most reverential terms of all her kinsfolk that he had known in his earlier youth. He dropped a tear silently over the memory of her Uncle Bill, who died many years ago. Many admiring boarders looked on. Never was more profound respect shown to a human being than was accorded to the lucky one. The l. o. waxed really eloquent as she looked upon her admiring auditory.

"I always was the luckiest woman that I ever see," said she. "I drawed a prize of $300 with a one-dollar ticket in a New York lottery once."

Then all looked upon her more admiringly than ever.

The reporter finally asked permission to take the dispatch to the telegraph office to see if it was genuine. He went to M. Riehle, the operator of the P. & A. Line, who assured him that the dispatch was bogus—that he furnished a blank to a young man, in the morning, who wrote the dispatch.

"But," said the reporter, "the woman says that you told her here that the dispatch was genuine."

"Yes," said Riehle, "the young man who wrote it was standing here when she inquired. He told her that it was genuine, and I had to back him."

The reporter took the dispatch back and told the woman that she had been hoaxed. It was really distressing to see her disappointment.

If the Pacific and Atlantic Line desires to have the confidence of the business public it will dismiss the operator who has made such humorous use of its message blanks.—*Terre Haute Express.*

LOCKWOOD'S MODIFICATION OF THE DANIELL ELEMENT.

The principal advantages claimed for the Lockwood battery are constancy and ease of management. Owing to the complete separation of the solutions, and the almost entire absence of local action resulting therefrom, the consumption of sulphate of copper and of zinc is very slow, and only in proportion to the work actually done, and from the same cause the saturation of the zinc solution is also greatly retarded. The internal resistance of the battery remains almost absolutely unchanged after the first few days, until the entire charge of sulphate is converted into metallic copper, which occupies several months, and the strength of current, as shown by the galvanometer, does not vary perceptibly during this time.

A recent test made of three different batteries, of 11 cups each, showed the following result: One of these batteries had been set up only a few days; another had been set up and kept on short circuit 60 days, and the last had been up and upon a line circuit measuring 95 ohms, continuously closed, for the same length of time. The variation of the internal resistance of the three, at the end of this time, was ·9 ohms, the first showing a resistance of 42·00, the second 42·9, and the third 42·1 ohms.

The copper element consists of two concentric coils of copper wire bolted on either end of a copper standard, the direction of one coil being reverse to that of the other, the sulphate of copper crystals not touching the upper coil. The zinc element is substantially the same as in other gravity batteries.

ECONOMIC VALUE OF SCIENCE.

It is noticeable that scientific subjects have received more attention from the newspaper press of late than formerly. This is partly owing to the efforts of scientists towards popularizing their respective specialties, as exemplified in the recent course of lectures in this country by Professor Tyndall. But there is another and more potent reason for it. In the scramble for wealth or the conveniences of life, the utility of knowledge is esteemed more than its speculative quality of abstract truth. It is becoming more generally known that discoveries, that seemed at first to be without any application to the wants of mankind, have at length, through the higher development of commerce by means of them, contributed to the general good. Experiments in magnetism and electricity, which led to the invention of the electric telegraph, were made from curiosity only. The modern chemist takes little note of the monetary value of his discoveries; but the practical man presently finds their application to some use that has its equivalent in dollars and cents. None could have anticipated the use of spectrum analysis to the arts, and yet it is found invaluable in the manufacture of steel.

Many other instances may be noted to illustrate the proposition that every addition that may be made to physical science is capable of an economic use, and that the practical value of all the knowledge we now have may appear with further discovery.

For such reason science is likely to receive increased attention from the practical, money-making world; but a real love of knowledge for its own sake is the characteristic of few, and we must expect that a very large portion of mankind will pursue the truth merely for the purpose of knowing it.—*The Typographic.*

M. JAMIN calls attention to the fact announced by Treve, that the poles of a magnet remove farther from the extremities when an armature is applied.

Digitized by Google

CORRESPONDENCE.

To the Editor of the Journal of the Telegraph:

Very few Morse operators would admit that their alphabet is an unsafe one for two thoroughly competent and careful operators to work by, and probably none would question the fact that errors in telegraphing have been found where spaced characters occur, and it would seem impossible to make exactly such blunders with the Continental alphabet, consequently we conclude that the fault is partly with the spaced characters and partly from a lack of judgment on the part of the operator.

If the objection to spaced charaters is removed, then we have but one weakness to deal with, viz.: the judgment of the operator.

The Continental alphabet appears particularly suited to operators of ordinary capacity, which class is largely in the majority.

I believe two intelligent operators could, in two hours, become practically proficient in the Continental alphabet. Errors would not be increased by the change, because the operator's mind would be more directly upon his work from the fact of there being a change.

There would be no confusion of the two systems, any more than persons speaking two languages would run one into the other, except by way of explanation, which would be apparent at the time. The Continental alphabet was arranged by experts, and is the result of long study, which no one will claim for the Morse.

It has been suggested to Americanize the Morse, by supplying plain characters for the spaced ones, leaving all others as at present arranged. This is a step in the right direction; but as the telegraph is universal and not sectional, it appears to me, if we change at all, it should be made universal.

We need something to prevent the ridiculous blunders made by telegraphers. The adoption of the Continental alphabet will not cure all, but it will certainly reduce them.

Telegraphing is an attractive business, being neat and novel, its development unparalleled; consequently many persons have adopted the profession who are wholly unfit by nature or education for this service, and from present indications we may look for little improvement in that quarter.

Admitting the Morse system is safe and more rapid in the hands of experts than the Continental, any alphabet would be equally so for them—but we have to deal with the large majority of operators who are not, and, further, who never will be, experts; but in changing the alphabet we do not strike at the root of the matter.

Our telegraph managers should extend inducements for experienced competent operators to remain in the service; one way to do it would be by a gradual yearly increase of compensation, based upon merit.

This is done in other professions. Telegraphing is not a trade which a person can become proficient in by three or four years' service—progress in telegraphing is illimitable, and we should see greater progress made were the inducements for application and ability properly appreciated.

Why does a young operator of two or three years experience command equal pay with one who had devoted ten to twenty years to the service? It is because he can manipulate as well, his judgment not always being considered. The experienced operator has no encouragement beyond a certain limit, to which point the young operator has arrived, and there they both stick. I believe if our financial men, and from president down to managers, would give more intelligent consideration to the details of a telegraph line, they would be surprised to learn to what an extent this point has been overlooked.

D.

LEXINGTON, ILL., April 26, 1873.

To the Editor of the Journal of the Telegraph:

As it appears you wish to hear the opinion of operators in general on the contemplated introduction of the "European alphabet," allow me to express a few opinions in its favor, as it appears to me. It is argued by some of your correspondents that the only fault of our present system is, "operators do not write and receive it correctly," which idea, I think, is perfectly correct. Were it transmitted and received correctly, there would be no necessity to make any change; but the very fact that it is not, and never has been, is proof that it never will be, as the chief requisites of correctness are not in it—I mean simplicity; and the seemingly wholesale charge made against operatives of carelessness in writing, is not, in my opinion, going in the least to stop it. The Company have excercised all the care possible in the matter, have issued explicit and stringent rules on the subject, and yet the abuse goes on. I think the Company owe it to their own interest to introduce a system that will at least help to remedy this evil, since it is impossible to *compel* their employés to take the necessary care in avoiding mistakes; and, as the business will continue to be done by the same class of irritable and careless men (as your correspondent *Reform* would have us believe we were), it is hopeless that their temper and inclination will suddenly become perfect, so that they will in future prevent any error. But supposing they did, the proposed change would but add to their efforts, and then we would have a happy and almost faultless system and fraternity. The argument that some of the characters are painful to make and some of the numerals even frightfnl to look at, shows a disordered state of the nerves and diseased brain, and such petty and selfish motives must not be admitted as an argument, when paramount interests of such weight are at stake; and, as the most difficult letters are of the most rare occurrence, and the letters which are used the most are of the most simple construction, there can be very little objection on that account. I think *all* the operators in the W. U. Company employ can, in two weeks, make the change; and although at first could not as readily and as quickly transmit and receive, yet the inconvenience would only be of a few days' duration. After, we would all feel much more safe as to errors, and the length of the new letters would more than compensate for the time lost in spacing the old ones.

R. H. McLEAN.

To the Editor of the Journal of the Telegraph:

To be brief in expressing an opinion in relation to the proposed change in a part of the alphabet, I would simply say that I think "Reform," in the last number of the JOURNAL, has hit the nail squarely on the head. The difficulty lies not nearly so much with the Morse alphabet, as the manner in which it is transmitted. When operators learn to form the characters as they should be, with the proper spacing between letters and words, the complaints of errors will be few and far between. I have been at the key of an extremely busy railway line over ten years, and have never found cause to wish for a change in the alphabet, but daily see the necessity of improvement in the sending. The Morse characters are easy enough to receive, when properly sent, and I would rather see the Company begin at the true root of the evil than to be taking on European airs.

OLD STYLE.

JAMESTOWN, Pa., April 11, 1873.

To the Editor of the Journal of the Telegraph:

I notice that the subject of changing the Morse Alphabet is being considerably agitated among the members of the telegraphic fraternity. Now it seems to me that the discarding of the system of signals that have been in successful daily use for over a quarter of a century, and adopting the European instead, is the height of folly, and I think the majority of practical telegraphers throughout the country are of the same opinion. Of what benefit would it be to use the same alphabet as Germany? No operator would be capable of taking charge of an office in Germany unless he first became familiar with the language of that country. The same remark will apply equally well to all foreign countries. It is claimed that a majority of the "*bulls*" that are made is on account of the spaced letters. Admitting this to be true, although we can see no reason why it should be if the Morse characters are properly transmitted, and that a change is essential, then does it necessarily follow that we are obliged to draw upon the talent of Europe for the remedy? Most emphatically it does not. The telegraphers of America have always found themselves equal to any emergency, and we are strong in the belief that they are equal to this. As far as our personal experience extends, we have always found it an excellent rule to let well enough alone. But if a change we needs must have, let us exhaust our home resources first, and not resort to foreign aid until we prove ourselves unequal to the task. EXCELSIOR.

PHILADELPHIA, April 23, 1873.

To the Editor of the Journal of the Telegraph:

I notice in your last issue considerable "kicking" against the proposed change of alphabet. Now, I do not see why any operator should have anything to say against the change, for the following reasons: 1st. After committing the European alphabet to memory, it is much easier and quicker transmitted over the wire, with less errors, than the spaced letters now in use; and, 2d, all the errors which chiefly occur from spaced letters would be done away with. I notice the correspondent who signs himself "Reform" speaks of there being no end to errors in case of change. Now, I differ with him there; my opinion is just the contrary. I do not see how there could possibly be any errors at all. I say, give us the new alphabet; bring it generally into use, and I will bet there will not be many operators who would change back again after it has been in use a couple of months. I think, if operators would look into the matter right, that those who would be opposed to the change would be few and far between. For my part, and the benefit the telegraph companies would derive from it, I say, bring the European alphabet generally into use before many months.

R. W. C.

MUNCY, Pa., April 18, 1873.

To the Editor of the Journal of the Telegraph:

I would like to say a few words in defence of the old Morse Alphabet. Since the subject has been brought forward I have talked to a number of operators, and all are down on a change. In my opinion it will only create more confusion, take more time, and what for? Only to be like Europe. It seems to me American people are going crazy on the subject of aping Europe; hope the W. U. Tel. Co. will pass through the epidemic unharmed. America can take care of herself in all things. If I could see any improvement, then I'd say adopt it at once, the sooner the better. I was a plug once, the ordeal is still fresh in my memory; don't want to go through it again. Cling to the old love; it is better than a new one. Respectfully, M.

Digitized by Google

CINCINNATI, O., April 29, 1873.

To the Editor of the Journal of the Telegraph:

There is, and perhaps justly so, a great hue and cry about our Morse Alphabet. Some of your correspondents advocate a change to that one used in Europe. This cannot be urged on the ground of universality, for that is out of the question, as it would leave the Russians out in the cold, as their alphabet is different from any other; and why make it necessary for us to learn an almost entirely new alphabet, when all that is wanted is to rid ours of its spaced letters. If we adopt the European alphabet the confusion must be great. For instance, we have a combination for the letter "C;" now, if we use the European letters we transpose this by the letter "J," and the "J," in turn, must be arranged by the transposition of some other letter, or by the formation of an entirely new combination. Thus, we see, there are *three* things to cause confusion to re-arrange but *one* letter, and, as there are eleven letters and no character "&" in that alphabet, we would have twelve times three, or *thirty-six* things to confuse us. Would it not be better to give us an entirely new alphabet of our twenty-six letters, and thus save us ten "confusions?" Universality of the alphabet is out of the question so long as the Russian language is used in telegraphy—and how about the "Heathen Chinee?" C. S.

CLINTON, Ia., April 24.

To the Editor of the Journal of the Telegraph:

I believe that a change of alphabets will result in injury to the Company, and to the public at large. To be brief, I have been a telegrapher 22 years, one year of which a "Bain" opr., and I am positive that an alphabet so full of dashes is more difficult to transmit correctly than our present one, and requires more time. Furthermore, I am satisfied, after careful examination, that there cannot be a better alphabet than the old "Morse. Every character, however rapidly made, strikes the ear with that rythm and harmony that any other fails to do; and if this be the case, the alphabet is not blameable for errors. It is the stupid, heedless operator. IOWA.

MT. STERLING, Ill., April 25, 1873.

To the Editor of the Journal of the Telegraph:

Eighteen years ago I entered the telegraph office at Frankfort, Ky., in the good old days of "short circuit," with "J. D. R." as our Supt., and such experts as Leonard, Rutherford, Trabue, Fisher and Taylor as operators. Since then, many and rapid changes have taken place in the art "*Telegraphique*," and though I am not at the present writing engaged in the business, I have watched with great interest the onward march of the old South-Western until it became finally absorbed by the unconquerable "Western Union," who certainly deserve great credit for the rapidity with which they have so far met the advance of civilization in extending their wires all over the Union. I have noticed, with some interest, the various pro and con arguments in the JOURNAL regarding the change of alphabets, and from my extensive acquaintance in telegraph circles, as well as practical experience, am forced to the conclusion that any change from our old alphabet would result in but little, if any, benefit to the public, and would most assuredly greatly incommode any Company adopting it, and, as some of your correspondents say, "make first-class plugs of now first-class operators;" or in case any change is made, I would most respectfully suggest a change be made *only* in the spaced characters, and not the entire Morse system. I am, however, satisfied the Western Union will not adopt any change without giving its operators a fair time to prepare themselves for it.

R. L. RUSSELL.

SANDY FLAT, Cal., April 23, 1873.

To the Editor of the Journal of the Telegraph:

In your issue of April 1st is an inquiry from Cowan, Tennessee, concerning the consumption of material and the attention required by the Callaud battery, when used as a local. The writer of the article asserts that the zincs must be cleaned over in every ten days. It is now just nine months since I put up two cups of Callaud to run a very poor sounder in this office, and during that time they have consumed but five pounds of bluestone and a tablespoonful of sulphate of zinc. The zincs first used are still working, and appear to be but a trifle smaller than they were originally made, and during their term of service have not been cleaned or disturbed in any manner whatever; nor has the battery been taken down or examined, except to observe the condition of the zincs. Perhaps the professor at Cowan could save himself a few rubs by permitting himself to gradually become less industrious, thereby giving his local a wholesome rest.

STANISLAUS.

To the Editor of the Journal of the Telegraph:

A is a connecting office between two companies. B is a Western Union office. C is an office of the connecting company. B sends a message addressed John Johnson, Angletown, *via.* C, 10 words, collect. Connecting company refuse positively to receive this message unless check changed on the copy from collect to paid, as they can only deliver the message by mail. W. U. rules say, "check on message must not, under any circumstances, be changed." The customer at B, when notified that message is stopped at A, wishes to pay the tolls and have it forwarded. What should W. U. managers at A and B do in this case, which is one of frequent occurrence? Please reply in JOURNAL, and oblige,

KIMMER.

Answer.—It is hard to believe that such cases are of frequent occurrence. The Receiver should not have taken a message collect to a point at which there was no office. The office at which the error occurred should be notified to collect the charges, and the message should be entered as paid and be forwarded to its destination. The spirit of Rule 77 does not apply to cases of this description.

To the Editor of the Journal of the Telegraph.:

Has a relay office a right to dispute a D. H. message? Is it not the duty of the office which is its destination to refuse it, if it is refused? Please give me your advice.

Answer.—No office, be it relay or terminal, has a right to refuse to receive or to deliver any message which is offered when the proper form of numbering and checking is observed. It makes no difference whether such message is paid or free.

MONTPELIER, Vt., April 23, 1873.

To the Editor of the Journal of the Telegraph:

Suppose I receive a message for Mr. A. requiring an answer, and it is promptly delivered. He cannot answer it, but sends the carrier, instead of going himself, to Mr. B., who can answer it. "You will find him," he says, "at his office." Away goes the boy, patiently and faithfully, but only to be sent by the clerk in B.'s office to Mr. C.'s house, still further away.

Now, was not the whole duty of carrier, manager and company in the case, done, when the message was first delivered to Mr. A.? STRIKER.

Answer.—Yes. Too much time is spent and too many service messages transmitted in endeavoring to induce people to send answers before they have anything to say.

TIFFIN, O., April 10, 1873.

To the Editor of the Journal of the Telegraph:

Executive order No. 146, reads—"No replies to stamped messages will be sent free, unless the signal 33 is contained in the check."

Supposing "A." sends a message to "B." 12 D. H. stamp. Parties at "B." offer an answer and refuse to pay for it. Should it be sent *Collect*, and is "A." responsible for the tolls?

Answer.—Under these circumstances the office at B. should require that the message offered as an answer should be prepaid. The receiving clerk should, however, courteously advise the sender that the matter will be immediately presented to the Superintendent, and the tolls will be refunded if improperly collected.

Anonymous.—When a person who is staying temporarily in a place, expecting a message, and who, leaving before it arrives, desires that it should be forwarded to him to some other point, the office to which such request is made should require the usual guarantee. No other course would afford adequate protection to the Company.

H. W. G.—To become an operator, it is necessary to have a practical education in the art. Theoretical knowledge only can be derived from books. Your penmanship is good enough.

G. W. S.—No half-rate message can be received for less than twenty-five cents. It follows that when a half-rate message is offered for a station to which the full rate is thirty-five cents, the charges for seventeen words will be no greater than for any less number.

R.—The courtesy of the officers of the Western Union Company allows the social messages of their employés, under certain restrictions, to pass free over the lines. Such being the fact, the issuing of franks to them is unnecessary.

M. and D.—We cannot inform you as to the chances for an operator's position in England. You had better address Mr. R. S. Culley, London, England. The salaries paid to first-class operators in England do not average more than forty dollars per month, and are still less in other countries of Europe. Neither in pay nor in social position is the condition of operators in Europe at all to be compared with those in America.

W. U. T.—When a message, which has been received free, is delivered, your whole duty has been performed. If the message should be offered to another Company for transmission to a point upon their lines, they would probably treat it in accordance with their rules, with which the Western Union Company have no concern. This Company does not guarantee the charges upon such business.

An Opr.—Sulphate of copper and sulphate of zinc are salts of different metals. The former, commonly known as blue vitriol, is a salt formed by roasting the native sulphuret of copper, or by dissolving the protoxide in dilute sulphuric acid and crystalizing by evaporation. The latter, sometimes known as white vitriol, is formed by the action of dilute sulphuric acid on zinc. They are as distinct in substance as the metals forming their base.

B. K.—Any person engaged in the business of telegraphing is eligible for membership in the Telegrapher's Life Association, and, in the event of his leaving the business, he can retain his connection, subject to the same conditions as when he became a member.

J. B. H.—In a Daniell's cell it is the copper crystals which are formed upon the copper cylinder, and upon the outside of the porous cup, that is valuable. The black or reddish deposit upon the zinc is valueless.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
May 15, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Hereafter the tariff for Other Lines to Grand Forks and Sheyenne Crossing, Dac., will be 175 and 12 from Chicago, Ill.

Laurel, Del., re-opened.

Manteno, Ill., closed.

Opdyke, Ill., re-opened.

Tamaroa, Ill., closed.

Augusta, Ind., closed.

Kendall's Mills, Me., changed to Fairfield.

Kingston, Md., re-opened.

No. Dighton, Mass., closed.

Hereafter the "tariff for Other Lines" to Audubon, Georgetown, Glyndon, Hawley, Lakeside, and Moorhead, Minn., will be 175 and 12 from Chicago, Ill.

Marion Station, Miss., closed.

Alexandria, Neb., closed.

Business for Drakesville, Dayton and Englishtown, N. J., will hereafter be checked direct.

Lake Mahonk, N. Y., will be re-opened June 1; "tariff for Other Lines" 25 and 2 from New Paltz, N. Y.

The P. O. A., of Phillipsville, N. Y., is Belmont Station, Phillipsville.

Emerald, O., re-opened; square 241.

Hughes Station, O., closed.

Lockbourne, O., closed.

The P. O. A. of Adamsburg, Snyder Co., Pa., is Beaver Springs, Snyder Co., Pa.

Business for Penn Haven Junction, Pa., will hereafter be checked to Penn Haven.

Business for Bristol Ferry, R. I., will hereafter be checked to Fall River, Mass.

Cedar Hill, Tenn., closed.

Ophir, Utah, re-opened.

Fortress Monroe, Va., re-opened; check direct.

Business for the following Other Line Offices in Wy. will hereafter "Leave this Line" at Bryan. Tariff for Other Lines 50 and 8 from Bryan for Bitter Creek, Black Buttes, Point of Rocks, and 65 and 4 for Red Desert and Table Rock.

NEW OFFICES.

WILLIAM ORTON, *President.*

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
NEW YORK, May 2, 1873.

EXECUTIVE ORDER, No. 147.

Rule 94 is hereby modified as follows:

No original sent message, or duplicate of a received message, will be allowed to pass out of the possession of the Company, except by authority of an Executive Officer.

Whenever a manager or other employé is subpœnaed on the part of the sender or receiver of a message, to produce it before a court or other legal tribunal, he will comply with the subpœna, and afterward return the message to the files. When subpœnaed by any party other than the sender or receiver, he will take the message into court and submit to the Judge that he ought not to produce it, the communication being privileged, and that he cannot do so unless a rule of court is entered requiring it. If such rule is entered the manager must obey it, asking the clerk to give him a copy of the rule and message.

The subpœna and other papers in connection therewith should be retained on file with the message to which they relate.

WILLIAM ORTON, *President.*

ANOTHER CABLE TO CUBA LAID.

From Key West, Fla., under date of May 13, we learn that a new cable has been successfully laid between that point and Havana, Cuba.

THE CALIFORNIA AND TEXAS RAILWAY CONSTRUCTION COMPANIES' TELEGRAPH.—The California and Texas Railroad Construction Companies' telegraph line is already constructed and in operation from Marshall, Texas, to Sherman, Texas, passing through the northern tier of counties in that State. It was completed on the 16th of March last, and has upon it eight offices. Mr. Max Elser is chief operator, with his headquarters at Marshall. The line connects with the Western Union Company. It passes through the best cotton growing region of Texas, and is 218 miles in length.

BORN.

BOUER.—At Leetonia, O., April 24, 1873, to M. A. Bouer, Manager W. U. Tel. Office, a daughter.

CLEMANS.—At Urbana, O., April 22, 1873, to L. T. Clemans, Manager W. U. Tel. Office, a daughter.

JONES.—At Freedom, Ind., April 24, 1873, to J. H. Jones, Manager W. U. Tel. Office, a son.

MARRIED.

HANNUM—MCALLISTER.—April 24, 1873, at the residence of the bride's parents, at Circleville, O., Mr. J. C. Hannum, Agent and Operator at Groveport, O., to Miss Anna McAllister.

WESTERVELT—ASHWORTH.—At Corpus Christi, Tex., April 19, 1873, G. W. Westervelt, Manager W. U. Tel. Office, to Miss Kate Ashworth of Indianola.

DIED.

ECKERT.—At Washington, D. C., May 1, 1873, Elwood D Eckert, youngest son of Thomas T. Eckert, Genl. Supt. of the Western Union Telegraph Company. The remains of the deceased were taken to New York for interment.

HICKS.—At his residence in Cleveland, Ohio, May 2, 1873, from a stroke of paralysis, George B. Hicks, aged forty-two years.

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS 39, 40 AND 41, UP TO MAY 11.

The acknowledgment of receipt of any assessment is to be understood as an acknowledgment for all previous assessments:

ASSESSMENT No. 39.—800 934.

ASSESSMENT No. 40.—1699.

We are notified of the death of James R. Dunlap, certificate No. 1520, which occurred at Grafton, W. Va., on the sixth inst. He died of acute rheumatism, and leaves a wife and two children. This is the first death in our ranks since that of Thurber, which occurred March 13th. Notices of Mr. Dunlap's death will be issued in due season.

FOREIGN TELEGRAPHIC ITEMS

BRITISH-AUSTRALIAN TELEGRAPH COMPANY.

The fourth ordinary meeting of the British-Australian Telegraph Company was held on Monday, April 21, when the directors' report was adopted. The meeting was then made special, to authorize the transfer of the business and property of the Company to a new company, to be called the India, Australasia, and China Telegraph Company, on conditon that this last-mentioned Company also acquire the business and property of the British-Indian Extension Telegraph Company, Limited, and of the China Submarine Telegraph Company, Limited. This is, in fact, carrying out the amalgamation of the British-Australian, the British-Indian Extension, and the China Submarine Companies, which has been for some time past advocated by several of the most influential shareholders in each of the three companies. The proposed terms of amalgamation are as follows: To issue to the shareholders of each Company, in exchange for their shares, fully paid-up shares of £10 each in the new Company in the following proportions: For each share in the British-Australian Telegraph Company, £11 in the new Company; for each share in the British-Indian Extension Telegraph Company, £15 in the new Company; and for each share in the China Submarine Telegraph Company, £11 in the new Company. These relative proportions are based upon a computation of the present relative value, and an estimate of the prospects of the several companies, and the directors of this Company consider the terms fair and equitable. The shareholders at the meeting also took the same view of the matter, and expressed their unanimous approval of the amalgamation, and also the terms proposed. It was not possible, however, to formally carry the resolution for an amalgamation, inasmuch as, after the registration of the new Company, it was discovered that its title was almost identical with the title of a company registered some years ago, and therefore it becomes necessary to slightly alter the name of the new Company. This will be done at once, and in a few days a formal meeting will be called to again submit the resolution for the approval of the shareholders. This will be purely a matter of form, as the meeting to-day unanimously sanctioned the amalgamation.

CHINA SUBMARINE TELEGRAPH COMPANY.

At the ordinary meeting on Tuesday, April 22, of the China Submarine Telegraph Company, a dividend of one-half per cent. and a bonus of one per cent. were declared, making a total of 4½ per cent. for the six months. The question of the amalgamation of this Company with the British-Indian Extension Company and British-Australian Company was brought before the meeting, and the terms of the proposed amalgamation were unanimously approved. Another meeting will, however, require to be held to legally carry the resolution for amalgamation, inasmuch as, since the notice convening the present meeting was issued, it has been discovered that the title of the new Company, which has been formed to take over the property and business of the above-named three companies, is almost identical with that of a company registered some years ago, and therefore it becomes necessary to re-name the proposed new Company. The directors have it in contemplation to call it the Eastern Extension, Australia, and China Telegraph Company. A meeting will be called in a few days, when the resolution sanctioning the amalgamation will be submitted.

THE PROPOSED GREAT TELEGRAPH AMALGAMATION—THE "GLOBE" PROJECT.

This week the holders of Telegraph property have given one more, and a very striking proof of their determination to combine for the protection and good management of their property; they have shown that they both see in what direction their real interest lies, and are resolved to pursue it. On Wednesday last there were held, at the Cannon-street Hotel, informal meetings of the shareholders of the Anglo-American and French Atlantic Telegraph Companies, with the express object of making such representations to the respective Boards as shall expedite the carrying into execution of the too long deferred project of Amalgamation. The opinions elicited upon this occasion were unanimous in favor of a complete consolidation of all the Atlantic Cable interests; and we must say that we heartily endorse the decision at which the assembled shareholders have arrived.

On all grounds amalgamation is to be recommended, inasmuch as it means unity and economy of management, and general security to the property. And the public are equally interested in a favorable solution of the matter, for it is only by this means that a perfectly trustworthy communication can be kept up, and low tariffs be finally established. The prosperity of the Telegraph shareholder means finally low tariffs, and his adversity means a rise in charges as against the public, as, indeed, the events of this very week have shown.

On Wednesday the assembled shareholders not only pronounced unmistakably in favor of immediate amalgamation, but they proceeded to resolve, almost unanimously:

"That in the opinion of this meeting, the scheme of the Globe Telegraph Company is well calculated to accomplish the object contemplated by the first resolution, and this meeting regards it, under the direction of the gentlemen whose names have already been announced, with such additions from the other Boards as might be thought desirable, as preferable to any other yet brought before the public."

The "Globe" plan has been examined by us before, and considering the weighty character of the names already attached to it, we cannot wonder at the support which it has met with, or at the opinions expressed that the existing Boards will do well to throw over any plans they may entertain, and adopt this one. Whom are telegraph shareholders to follow, unless it be such men as Messrs. Pender, M.P., Julius Beer, Cyrus W. Field, and C. W. Siemens, Sir James Anderson, Sir Daniel Gooch, M.P., Captain Sherard Osborn, and Baron Julius De Reuter? All these names are now identified with the Globe Telegraph Company, the Board of which thus embraces some of the best constituents of the Boards of all the telegraph lines. Such men as these will doubtless be found able to bind together, as it were, the at present disjointed telegraphic links, and to bring the telegraph system of the world under one powerful organization.

With reference to the prices at which the various Cable shares are to be merged into the Globe Telegraph Company, we understand that the Globe Directors are giving this matter their earnest attention, and that their decision with regard to the several valuations will be made known within a comparatively few days. It is satisfactory to learn that the basis of the valuation is an essentially just one—namely, the earning power of the various lines. By this means every shareholder will receive his undoubted right. We are also glad to learn that the Globe scheme will embrace the plan of a division of the capital into Preferred and Deferred Stocks—a plan whereby the requirements of the several classes of investors are effectually met.

Altogether, we think the great cause of efficient telegraphy has taken a great step forward this week, as a result of the meetings to which we have referred, and we congratulate the proprietors thereupon.—*The London Money Market Review*, April 26.

BRITISH-INDIAN EXTENSION TELEGRAPH COMPANY.—A dividend of 4 per cent., and a bonus of 1 per cent., were declared on Tuesday, April 22d, at the meeting of the British-Indian Extension Telegraph Company, making a total dividend for the year of 11 per cent. The shareholders also unanimously expressed their approval of an amalgamation with the British-Australian and China Submarine Companies.

THE WEST INDIA AND PANAMA TELEGRAPH COMPANY.—It is understood that the Telegraph Construction Company's repairing vessel would sail early in May to repair the Porto Rico and Jamaica Cable, and also to effect any other necessary repairs. In addition to this, negotiations have been opened with the Samana Bay Company to secure their active co-operation for connecting San Domingo with the West Indian Company's system of Telegraphs by the laying of a Cable from Samana Bay to Porto Rico. The heavier work, however—viz., the line from Jamaica to Panama—is being rapidly proceeded with, with every prospect of completion before the contract time.

MESSRS. Grant Brothers & Co., London, announce that the half-yearly Coupon No. 2, due 1st May, on the Seven Per Cent. First Mortgage Building Bonds of the Western Union Telegraph Company of the United States of America will be cashed at the fixed exchange of 4s. per dollar, equal to £7 per coupon (less income-tax), on and after that date at their banking-house.

MEETINGS of the British-Australian Telegraph Company, the British-Indian Extension Telegraph Company, and of the China Submarine Telegraph Company, were called for the 5th May, to pass resolutions for voluntary liquidation, and transfer of the respective undertakings to the "Eastern Extension, Australasia, and China Telegraph Company, Limited."

THE traffic receipts of the Submarine Telegraph Company for the three months ending the 31st of March amounted to £24,230, and for the corresponding period last year to £25,122.

IN consequence of a convention the Italian Government has agreed to work the telegraph lines belonging to the Sardinian Railway Company.

THE traffic receipts of the Eastern Telegraph Company for the month of March amounted to £33,572, and for the corresponding month in the previous year to £29,178.

THE Italian Chambers have approved a project for laying down a submarine telegraph line between Brindisi and Egypt.

IT is expected that telegraphic communication by cable between Portugal and Madeira will be opened in July.

THE total number of messages forwarded from the postal telegraph stations in the United Kingdom during the week ended April 5, 1873, was 326,563—an increase on the corresponding week of the previous year of 68,744.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended April 12, 1873, was 292,506—an increase on the corresponding week last year of 13,301.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, MAY 15, 1873.

ATTENTIVE AND RETENTIVE READERS.

The JOURNAL is fortunate in the class of readers which it addresses with such regularity twice in a month. Very little it says to them is lost, and this is rendered painfully evident when it is caught tripping. To be brief, within the past few months we have, in reply to correspondents, given decisions diametrically opposed, upon substantially the same question, and from a half dozen quarters we are called upon to "rise to explain."

In our issue of Dec. 2nd, 1872, in reply to G. R. S., we decided that "St. James Hotel" should be counted as two words. According to Rule 9, names of persons and places, when given to things, must be counted according to the number of distinct words in each, and surnames, containing any prefix, are to be counted as one word. St. James, being a surname, is one word, and Hotel being one word, and both being applied to designate a thing, must be counted according to the number or distinct words in each, viz: two.

And in reply to C. P. McAllister, April 15th, 1873, we stated there are thirteen words in—"I desire to meet you at the St. James, at nine thirty to-night." Rule 9 says: "Names of persons and places, where given to *things*, must be counted according to the number of distinct words in each."

The latter is the correct construction of the rule. St. James is a surname, without doubt, and when used for that purpose should be counted as one word, but when surnames are used as titles to *things* the wording of the rule is explicit—they must be counted according to the number of distinct words in each.

MANAGERS of offices which are worked under the commission system, should, in returning their monthly statements, show plainly upon the vouchers for service, the computation by which the amount due is arrived at.

THE color of the complimentary stamps for 1873 is blue.

Executive Order No. 147, modifying Rule 94, appears on page 182.

EFFICIENCY OF THE WESTERN UNION TELEGRAPH COMPANY'S LINES AND SERVICE.

Notwithstanding the fact that the Western Union Telegraph Company, in its relations to the people of the United States, enters into and has become necessary in its intermediary character to the general business of the country, its *personnel*, beyond a few leading names, and the means employed to maintain its lines and service at the present high standard of efficiency, is, except to a comparative few, a matter of entire ignorance. Very few of those whose necessities compel them to use the telegraph know or even give a passing thought to the labor and the intelligent skill which has rendered it possible to communicate their ideas and thoughts to remotely distant points with such invariable certainty. They leave their messages as a matter of ordinary business, confident that within a very limited period of time the contents will be in the hands of their distant correspondent. The invention of the electro-magnetic telegraph rendered this possible, but the perfect fruition of this possibility has never been experienced until within a very late date. Morse brought forth the bantling, but its present strength and perfection is due to others.

The efficiency of the telegraph service at this day is undoubtedly as greatly due to the condition of the lines, as conductors of electricity, as to the machinery of transmission. It is not very long ago when a continued heavy storm of rain, or what is still worse, a dense mist such as frequently occurs along the Atlantic coast, was almost as disastrous to telegraphic communication as a complete breakage of the wire. What with escapes, sympathetic currents, and other kindred troubles which regularly made an appearance on a moist day, instruments were rendered useless, and all communication consequently suspended. In our own experience with the House system, on a wet day, it has been only with the utmost skill and patience that we were able to send or receive messages between Portchester and New York, points distant only twenty-eight miles, while with Stamford, eight miles further, nothing could be done—we were unable to break him or he us. That this trouble was not due to the system we then operated is made plain by the fact that with the Morse relay upon the railroad wire between New York and Philadelphia, not ten years ago, after a twelve hours rain, it was impossible at New York to hear an office beyond Jersey City, and it is only within the last five or six years that this condition of the lines has been improved. Down to that period, each superintendent of a district kept the wires in order in his section. Nothing more was attempted or even expected. Defective insulation and bad joints in the wire utterly precluded the possibility of working more than three or four hundred miles in one circuit, except when the wire was newly erected.

These difficulties and troubles are now unknown. This result followed the action of the Western Union Company in placing under the charge of one person all matters relating to the construction, maintenance and equipment of its lines. The wires are kept at a regular standard of efficiency. Joints and splices of the wires are soldered. Insulation is made perfect by the use of non-conducting substances suitable to the atmospheric and other influences, which vary in different sections of the country. The resistance of the magnets are measured, and the strength of the batteries made to conform to the resistance of each circuit. These improvements render telegraphing as mere child's play, when compared with the labor of operators not a dozen years ago. It should be understood that whatever renders the transmission of telegraphic signals more easy to the telegraphist constitutes a gain to the public, not only in causing dispatches to be transmitted with greater speed and certainty, but in allowing them to be sent at a cheaper rate.

In operating its lines the Western Union Telegraph Company make use of two systems—the Morse, and a combination of the printing telegraph instruments invented by Royal E. House and David E. Hughes, respectively. The printing system, however, is employed to a limited extent only. Fully nineteen-twentieths of the business is done with the Morse. The ingenious arrangement of wires and circuits known as the duplex system, by which messages are transmitted in both directions upon the same wire, at the same time, is largely employed by the Company. This invention has practically doubled the capacity of the lines.

The maintenance of the service at the present standard, and the never-ending extensions of the lines in order to keep pace with the development of the country, requires the employment of a force which, in point of skill, is unequalled in any other business. The high rate of salaries paid by the Company for skilled labor has developed and drawn into its service an amount of ability superior to that upon any other system of lines in existence, while the management has been so wise and so practical that this body has become knit and bound together, so that the power and influence of the combined intelligence and skill is as though it was embodied in one person.

The affairs of the Company are managed by an Executive Committee, chosen by the Board of Directors, composed in part of the President and Vice-Presidents. This Committee controls the appointment and rate of compensation of all employés, and maintains a general supervision over every department of the service. The territory covered by these lines is separated into four Divisions, called respectively the Eastern, Southern, Central, and Pacific, each of which is in charge of a General Superintendent; and these Divisions are subdivided into Districts—of which there are twenty-nine in the United States and the British Provinces—each under the immediate control of District Superintendents.

The Electrician of the Company has charge of, and is responsible for the maintenance of the lines at the standard of efficiency established by the Company.

Digitized by Google

All matters pertaining to construction and reconstruction and the maintenance of the wires at a uniform degree of conductivity, also the machinery used in the transmission of messages, both as to form and power, and also such other matters as would properly pertain to the office, is under control of the Electrician. To this officer is referred all machinery offered for the service of the Company.

The Western Union Company have established and maintain offices at almost every town and village in the country not reached by the lines of the companies with whom they connect, it being an established rule to open an office at any place through which their lines pass where the receipts will equal the expenses. If such a result appears doubtful, the guaranty of a few responsible citizens against loss is accepted.

Nearly 8,000 persons are upon the pay-roll, operating about five thousand offices, and in all the principal cities of the country the telegraph is available every hour of every day and night from the beginning to the end of the year.

THE TELEGRAPH IN AUSTRIA — LETTER FROM MR. GEORGE B. PRESCOTT.

VIENNA, April 18th, 1873.

MY DEAR SIR: In Austria a differently constructed telegraph system from any other yet seen on the Continent is found. In France, Belgium and North Germany cross-arms are not used, the insulators being fastened directly to the poles, but in Austria the cross-arms again appear. They consist of round sticks of wood, of about three inches in diameter, apparently the natural timber with the bark taken off, and unpainted. When many wires are carried two poles are used, which are joined together at the top, and separated at the bottom about five feet, thus forming what the English call an A pole. The cross-arms are alternately fastened upon each side of the pole, as they are in England, a preferable plan to ours where they are all placed on the same side. In Vienna the wires are carried on iron poles, no underground wires being employed either here or in any part of Austria. The pole is made of cast-iron, and is very ornamental. It consists of an iron column about twenty feet in height and one foot diameter. The lower end is screwed to a stone base. At the top of the column a horizontal arm extends about two feet on either side, and from the ends there extend two vertical shafts fifteen feet in height, thus constituting an iron column with two branches, resembling a candlestick holding two candles. The two upper shafts support eight iron cross-arms, and each cross-arm carries eleven wires, so that each pole carries eighty-eight wires. The poles are about one hundred and thirty feet apart. The line presents a very fine appearance, and does not disfigure the fine streets through which it passes. In aerial structure it surpasses anything I have ever seen in the telegraphic way. The Government has only one office in Vienna for transmission of despatches, but it has eleven offices at which messages are taken in, and from which they are sent to the transmitting office by messengers. There is a private company, however, the "Weiner Privat Telegraphen," which has about sixty stations in Vienna, and forty in the vicinity. This company obtained the privilege of constructing and operating lines from the Government, and is doing well. Last year it divided 80 per cent. Its wires run into the Government office, and deliver messages for the latter, receiving therefor 10 kreutzers (5 cents). For messages received, transmitted and delivered in the city it charges 15 kreutzers, or 7½ cents. For messages sent into the country 25 kreutzers, or 12½ cents. This private company connects with the banks and newspaper offices, who furnish their own operators. The market reports are copied on slips, and are carried about by boys, who offer them to passers by.

The Austrian territory is divided into two telegraphic zones. The charge to the first is 40 kreutzers, and to the second 60. The male operators receive from 600 to 1,000 guldens or florins ($300 to $500) per annum. The female operators from 250 to 350 florins (from $125 to $175) per annum. In addition they both receive half a kreutzer (quarter of a cent) per message as a commission for their work when employed on the Morse, and three-quarters of a kreutzer on the Hughes. Two clerks are employed on the Hughes, one to operate and the other to count the words in the message, and to paste the strip and attach it to the blank. They employ no envelope, but fold up the blank, leaving the address on the outside.

In Vienna there are 21 Hughes and 79 Morse instruments, and to work them there are employed 86 female and 235 male operators. The number of employés to do a given amount of work is always strikingly greater in Europe than in America. There is none of that hurry and bustle which we see at home. This is particularly marked in Vienna. Every one smokes his cigar leisurely, bows politely, takes his hat off to a superior, touches it to an equal or even an inferior, and never seems to think there is anything worth fretting or hurrying about. The Director-General comes to his office at 12 or 1, and gets through at 3. In the offices everywhere, and at all times, everybody smokes. The operators at the instruments, the clerks at the desks, all smoke, and there is a cloud of smoke everywhere. In fact, from the Director-General to the porter there is no exception, and even the soldier on guard at the palace solaces his lazy hours with the indispensable weed. In Berlin, there was an exception to this almost universal German custom in the telegraph offices. No one was allowed to smoke there, the Director-General being too good a disciplinarian to permit it. In Vienna they are building a splendid telegraph office. The walls and roof are already up, and they are now at work upon the interior. The building is five stories, and is built of stone resembling the Nova Scotia free stone, but of a better quality, and highly ornamented. In front there is a sculptured figure of Time, and a group representing the Telegraph. The building will cost 800,000 florins, or $400,000. It is square, and has an inner court also square, and admits light from four sides, without and within. The operating room is on the top floor, and occupies three sides of the building. On the front the operating room is 160 feet in length and 23 feet in width. On the two sides of the building the operating room is 150 feet in length and 23 feet in width, making in all a room 460 feet in length and 23 feet in width. The lower floors are all to be used for the various purposes of the telegraph. On the opposite side of the street they are erecting a splendid Exchange, and adjoining it a new post-office. These are to be connected with the telegraph by a pneumatic tube, and a pneumatic tube will also convey the messages to the operating room from the receiving office.

The Austrian Administration are just about to adopt the stamp system of paying for the transmission of messages, they having hitherto done nothing in this way. The Director-General thinks it will be a great improvement.

Yesterday, through the kindness of Gen. Van Buren, I visited the Exposition Buildings. They are very grand and splendid, being several times as large as those at Paris, but they are yet very far from completion. Scarcely anything has yet been taken into the buildings, and it will be many weeks before the whole will be in proper shape for exhibition. Indeed the great dome is yet in a state of construction, and if they get this and the grand entrance in proper condition for the opening they will do well. The probability is that the opening will take place on the first of May, as announced, and then it will be closed for a month. This is Gen. Van Buren's opinion. The grounds about the Exposition are already covered by hundreds of side shows, among which there are wax works, fat women, giants, dwarfs, and the numerous other *novelties* usually to be found at great gatherings. In the mean time the publicans are waxing fat, and the poor stranger is taken in and fleeced. Prices are enormous for everything. At the opera, on Tuesday, as much as $25 was paid for a seat; this was partly owing to the fact that the royal family was to be present. On Sunday the Emperor's daughter is to be married to the brother of the King of Bavaria, and much excitement exists here in consequence.

We leave for Berne to-morrow morning. I have got some valuable maps and statistical documents from the department here.

Yours truly,
GEO. B. PRESCOTT.

Hon. WILLIAM ORTON, *President.*

TELEGRAPH POLES NOT LIABLE TO DUTY.

The following letter settles the question as to the liability to duty of Telegraph Poles imported from Canada. They are exempt from duty:

"TREASURY DEPARTMENT,
"WASHINGTON, D. C., May 2d, 1873.

"SIR: In reply to your letter of the 30th ultimo, I would state that if the telegraph poles referred to are imported in the ordinary condition as cut, whether with or without the bark on, they are exempt from duty under the provisions in the 22d section of the Act of July 14, 1870, for 'round unmanufactured timber not otherwise provided for.'

"I am, very respectfully,
"(Signed,) J. F. HARTLEY,
"*Assistant Secretary.*"

Hon. WILLIAM ORTON,
President, &c., New York.

THE Great Eastern and Edinburgh leave the latter part of this month to lay the cable from Valentia to Heart's Content. The Great Eastern will then return to repair the broken Anglo-American cable, and the Edinburgh will proceed to lay two new cables between Placentia, Newfoundland, and Sydney, Cape Breton.

THE steamer Hibernian left on Monday, the 5th inst., to repair the French cable, which is broken 208 miles from Brest.

AT a telegraph office, early one morning, the young gentleman operator, after repeated calls for a young lady operator in another office, at last gets a response, and then "click, click, click," (fortissimo,) he telegraphs back to her, vehemently: "I have been trying to get you for the last half hour!" In a moment the following spicy reply comes tripping back to him over the wires from the telegraphic maiden: "That's nothing! There is a young man here who has been trying to do the same thing for the last two years, and he hasn't got me yet?"

THE EARTH A GREAT MAGNET.

DR. MAYER'S LECTURE AT YALE.

The directive power of the magnetic needle as illustrated in the mariner's or the surveyor's compass, is a fact of so familiar knowledge that it usually passes, like the rising of the sun or the ebb and flow of the tides, as a matter of course, without exciting any thought of the causes to which it is owing. But a fact much less familiar is, that any light bar of soft iron, without possessing, to ordinary tests, the property of magnetism at all, will, if very delicately suspended (as by means of a single silk fibre from a cocoon) assume, though less promptly than the compass needle, the north and south position; and this the more readily when the point of suspension is a little out of the centre of gravity, so that at rest the bar stands somewhat inclined. A soft iron bar, also of considerable dimensions, may be made to exhibit magnetic properties, or to seem entirely devoid of them, by merely changing the position in which it is held. Even if the bar is not perfectly soft, it will manifest the same variations of condition under corresponding circumstances; but in this case still more remarkable phenomena may be made to appear, for if at the moment in which the magnetic property is most strikingly developed in it, its particles be thrown into vibration by a sudden blow with a hammer, the magnetism will not disappear with change of position as before, but will be permanent. But with a complete reversal of the position, and a second blow applied with precisely the necessary degree of force, this magnetism may be discharged, and the rod brought once more to its neutral state.

All these phenomena, and many more analogous to them, are described in the singularly luminous essay of which the title is given above—an essay which embraces the subject of a letter delivered by Dr. Alfred Marshall Mayer, Ph. D., Professor of Physics in the Stevens Institute of Technology, about a year ago, before the Yale Scientific Club in New Haven, and also, we should judge, a great deal that could not have been crowded into that or into any single lecture. The merit of this essay, which is remarkable, consists chiefly in the beauty of its logical method and the felicity of its illustrations. All the changes of magnetic condition, such as those above mentioned, brought to pass by varying the position relatively to the cardinal points of the compass, of soft or hard iron bars, or by subjecting them to concussion in their different positions, are shown to be such as to imply and to demonstrate the existence of an immense magnetic force in the earth itself, and to show that this force is so distributed in the earth as to give to the planet the character of being itself a great magnet.

The lecturer, in the original presentation of his argument before a public audience, possessed an important advantage in being able, by the aid of the enormously powerful electro-magnet constructed under the direction of President Morton for the Stevens Institute of Technology, to show how a great magnet ought to act upon masses and bars of iron subject to its influence, and upon conductors of electricity set into motion in its vicinity. The lifting power of this apparatus has never been fully tested, and probably could not be without breaking down its supports, and perhaps distorting the apparatus itself; but it amounts to some tons. When it is in action, if a keg of iron spikes be poured out, no matter how carelessly, a few feet above it, it will catch the whole of them in their fall and gather them in a compact cluster around its poles. Such a magnet exerts an influence upon iron rods some feet in length, at a distance as great as the limits of the lecture-room will allow. The lecturer holds such a rod in the position in which the influence of the earth's magnetism is neutral, and shows experimentally that it becomes strongly magnetized if pointed toward the pole of the artificial magnet. He shows, by the test of the compass needle, that the end of the bar directed toward the artificial magnet possesses a polarity contrary to that of the pole toward which it is directed, while the more distant pole has the same polarity. Reversing the bar, he finds its poles also promptly reversed; carrying the needle along the bar, from end to end, he finds that the pole which was at first attracted strongly is drawn more and more feebly until he reaches the middle point, or a point very near the middle, when all attraction seems to disappear; and afterwards, that the opposite pole begins to be attracted, and continues to be more and more so up to the end of the bar most distant from the magnet.

He then exhibits the beautiful phenomenon called the magnetic phantom—a phenomenon produced by sprinkling iron filings uniformly over a thin plate of glass resting horizontally on an artificial magnet, and then giving the glass a sudden jar. The iron filings, every individual particle of which becomes a magnet, seize each other by their correlated poles during the brief movement caused by the jar, and form a series of beautiful and symmetrical curves, which proceed continuously from pole to pole, and form a succession of lines of resultant magnetic force. A small magnetic needle carried along any one of these lines is found to place itself parallel to that line, or rather to take a position tangential to the curve, at every point of which it is placed.

The lecturer then inquires what ought to be the lines of magnetic force in the case of a magnet having the form of a sphere, and as these lines must necessarily be the same in the plane of every meridian of the sphere, he takes a plane disc of steel to represent such a meridian plane, and having magnetized it employs it to produce a magnetic phantom as before. Determining thus the forms of the lines of magnetic force for this case by direct experiment, he is prepared to institute such a comparison between the phenomena of natural and artificial magnetism as shall either establish the fact that the earth is a great magnet, or prove that it is not so.

As to the effects on rods and bars, they are in all respects identically the same whether the known cause producing them is Professor Morton's great electro-magnet, or whether they occur under the influence of the earth's magnetic induction. And as to the forms of the lines of magnetic force surrounding the earth, those, of which the position must everywhere conform to that of the dipping needle, are precisely such as the magnetized steel disc gives, when we place the magnetic poles of the earth where Ross and Wilkes found, or inferred, the dipping needle to be vertical, viz.: in lat. 70° N., lon. 85° W.; and lat. 70° S., lon. 125° E.

Another striking proof of the similarity of physical effects produced by artificial magnets and by the great natural magnet of the earth, is shown by the lecturer to exist in the equal facility with which electric currents are generated by magnetic induction in both cases. Faraday discovered that whenever a conducting body is put into motion in such a manner as to cut the curves of magnetic force, an electric current is generated, provided that the conductor forms a closed circuit. Upon this principle have been constructed the powerful magnetic electric machines, by which the great electric coast-lights are maintained by the British Government at Dungeness Head, and by the French at La Hève. By the rotation of a coil of insulated wire, placed in a position to cut in its movement the curves of the earth's magnetic force, the lecturer produces electric currents which powerfully act upon the galvanometer, and demonstrates the possibility of working a magnetic telegraph without any battery, and by means of electricity derived from the inductive influence of the earth's magnetism alone.

Having pretty well established the fact that the earth is a great magnet, the lecturer gives, toward the conclusion of his argument, some computation of the aggregate energy of this immense magnetic mass. Taking as a unit a steel magnet fourteen inches long by one inch wide and one quarter of an inch thick, magnetized to saturation and weighing one pound, he informs us that, according to Gauss, the earth's magnetism is equal to eight thousand four hundred and sixty-four millions of millions of millions (8,464,000,000,000,000,000,000) of such magnets; and that if this amount of magnetism were equally distributed throughout the mass of the earth, the magnetic intensity of each cubic yard would be equal to that of six of these magnets.

The essay, of which the foregoing sketch embraces but a cursory outline, will be read with pleasure even by those to whom the subject is familiar, and with substantial profit by every young student of physics, not only for the information it contains, but also as an admirable model of rigorous inductive reasoning.

ON MAGNETIC ENERGY.

A communication by M. Cozin to the Academy of Sciences, Paris, on Magnetic Energy (translated and abstracted for the *English Mechanic and World of Science*), treats the subject as follows:

The author has investigated, by experiment, the relation between the quantity of magnetism in the core of an electro-magnet and the magnetic energy. There does not exist, to his knowledge, any theoretical expression of that energy. He has found a very simple relation, analogous to that resulting, for the electric energy, from the experiments of Joule and Reiss, and the principles of thermo-dynamics.

The magnetic energy of a magnet is proportional to the product of its quantity of magnetism by its magnetic moment, or, which is equivalent, to the product of the square of this quantity of magnetism by its polar distance.

This proportion rests on the following facts: When an intermittent current is made to pass in the wire of an electro-magnet, the recent experiments of MM. Jamin and Rogers have demonstrated, in a definitive manner, that the core becomes heated. This heat is created at the interruption of the current; it is due to the disappearance of the temporary magnetism developed by the influence of the current; it is equivalent to the *magnetic energy* acquired by the core, and can serve to measure it.

For that purpose, the core being enclosed in the reservoir of a large thermometer of petroleum oil, and the reservoir surrounding by the magnetizing spiral, the author observed the movement of the liquid in the stem for five minutes before the passage of the current, ten minutes with the intermittent current, and then five minutes after the cessation of the current. Account could thus be taken of the heating action of the surrounding bodies, and, on dividing the effect of the intermittent current by the number of intermittences, the calorific effect of a single intermission is obtained; it is this quantity that measures the *magnetic energy*. It is essential that the core obtain its maximum of magnetization at each passage of the current, which is secured by suitably regulating the interruption. (*Ann. Chim. et Phys.*, Vol. XVII, 1869).

Digitized by Google

Concerning the quantities of magnetism and the magnetic moment, here are two simple cases, the verification of which is more simple than that of the general case :

1st. The author has shown before that the position of the poles in an electro-magnet is independent of the intensity of the current; whence it results that, if the intensity only is varied, the magnetic movement is proportional to the quantity of magnetism. The author, in consequence, measured the magnetic moment of the nucleus by the method of Gauss, for the different intensities of the currents, and compared them with the corresponding heating effects, which have been proportional to the square of the magnet moment. Thus, *when different quantities of magnetism are imparted to the core, the other circumstances not changing, the quantities of heat created by their disappearance are proportional to their squares.*

2d. The author placed successively in the large thermometer two tubular cores of different lengths (about 40 and 30 centimetres) and equal bulk, so as to obtain comparable results. With equal quantities of magnetism the magnetic moments of the two cores were proportional to the polar distances, and, measured by the method of Gauss, proportional to the corresponding heating effects. *When the polar distances of the cores is only changed, the heat created by the disappearance of the magnetism is proportional to that distance.* Let m be the quantity of magnetism of the core, l the mutual distance of the absolute poles; the law of the heat created in the cores of the electro-magnets is $Q=k\,m^2\,l$, k being the coefficient dependent on the unities adopted.

We may take, for unity of *magnetic energy*, that of a magnet which possesses the unity of magnetism, and of which the absolute polar distance is the unity. Then $m^2\,l$ measures the *magnetic energy*, and k is the *calorific equivalent* of *the magnetism.* The author hopes soon to give the value of this coefficient. The experiments of which the author gives the conclusions establishes an important analogy between magnetism and the other physical forces.

The two factors of the *magnetic energy* will be the quantity of magnetism and the magnetic moment, whatever that may be.

More of that "Mistaken" Zeal.—A few weeks ago we reported a meeting of London letter carriers, called by the Post-Office and Telegraph Service Benefit Society, at which complaints as to their pay and official treatment were made. It seems that a packet of bills announcing this meeting, addressed to the letter-carriers at the Southwestern District Office, was stopped in transit by the postmaster of that office, and has not since been heard of. The Secretary of the Society has since written three times to the Secretary of the General Post Office, stating the facts of the case, which, he says, is not the only one of the kind, and asking whether the action of the district postmaster was the result of "official orders or instructions," and no reply has been received. This seems like adding insult to injury. In the first place the authorities had no right to stop such a package, but having done so they might, at least, give a civil answer to a respectful inquiry. We understand, too, that every obstacle is being thrown in the way of the proposed petition to Parliament, and that the *employés* who interest themselves most in the movement are interfered with in the most petty manner.—*London Graphic, March* 29.

It is expected that four cables will be working across the Atlantic and five across the Gulf of St. Lawrence before the 1st of September.

SELF-SACRIFICE.

DEATH OF A BRAVE AND NOBLE-HEARTED GIRL.

In Millville died last week, says the Newark (N. J.) *Courier*, a young lady whose brief life was crowned by a brave and noble act, for which her memory should be held in high esteem and reverence by all whom the knowledge of her presence of mind in a moment of peril and determined devotion to the line of duty may come. Lottie Dougherty resided in Millville, and was educated at the Central School. She was one of Professor Culver's most attractive and promising pupils, and distinguished herself greatly in her studies. Last Summer, having studied telegraphing, she accepted a situation at Radnor, a station on the Pennsylvania Central Railroad, and boarded at the Eagle station, a mile or more distant. One evening in April last she was on her way to her station, when suddenly a terrible thunderstorm came up. The office at the Eagle was struck by lightning, the magnet was burned out of the instrument, and great consternation prevailed. Lottie supplied a magnet, though it was not her office. Going to the door, she noticed a large tree uprooted and blown directly across the track. She realized at once the dangerous situation. The Western Express was due in a few minutes, and local trains followed it close. Though all present opposed her resolution, the cool, determined girl, seized the red signal lamp, ran through the fearful storm up the track and swung her light, until she heard the engineer whistle down brakes, and the train was saved. The speed was checked so that the train was not thrown from the track, though it struck the tree with sufficient force to hurl a heavy limb against Lottie's shoulder, hurling her down the embankment into a ditch, and inflicting injuries which might ultimately result in death. Of course the passengers on the train were loud in their expressions of gratitude to her, and a handsome sum of money was tendered, but she refused it, and returning to her office remained on duty all night. She said she had only done her duty, and wanted no recompense of a pecuniary character. Eleven weeks ago Lottie came home to die. Ever since that fearful night she had felt the effect of the terrible blow upon her shoulder —consumption claimed her as its victim. Slowly but surely she faded away, enduring her sufferings in a patient and uncomplaining manner. She had all the attention that loving hearts could give, but she could not be restored to health. On Wednesday she died, surrounded by her family, who were plunged into sad affliction by the early demise of their loved one.

New Wire of the Delaware and Hudson Canal Company.—The Delaware and Hudson Canal Company have recently completed a wire from Ballston, N. Y., to Schenectady, which connects with a wire running over the Schenectady and Duanesburgh R. R. to Quaker Street, on the line of the A. and S. R. R. department of this company.

Portuguese Enterprise for a New Line of Communication.—The Director of the Portugal and Brazil Telegraph Company has had an interview with the King of Portugal. He presented to His Majesty, in an elegant casket, a map of the bed of the Atlantic over which the cable is to be laid, with specimens of the cable which had been selected. The section to extend between the Portuguese coast and Madeira will be completed by the manufacturers in June.

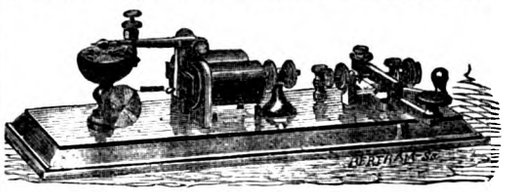
The production of musical sounds from magnets, by Dr. Page, was effected in 1837.

WATTS & COMPANY,

Baltimore,

MANUFACTURERS OF

Electrical and Telegraph Instruments



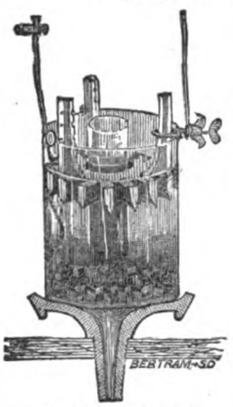
AND

MATERIAL OF EVERY DESCRIPTION,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER.



ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

SOLE MANUFACTURERS OF THE

NEW PATENT BALTIMORE BATTERY

MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7½ inches,
Specially adapted to Railroad Signals, Printing Instruments, etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country having proven the cheapest, and least trouble to maintain of any in the market.

Patented Dec. 31, 1872.

Also, Sole Manufacturers of the

Patent Circuit Closer Key,

O'Sullivan Self-closing Key,

Scott's Patent Hotel Annunciator

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

Also, of the

PATENT BATTERY INSULATOR

shown, holdin a cup of the Baltimore Battery in the above cut, which most effectually insulates the Battery as the drip passes off *thr ugh a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. Prescott, says of it:—"I think your Battery Insulator is very admirably adapted for the purpose designed, and it ought to receive general adoption."

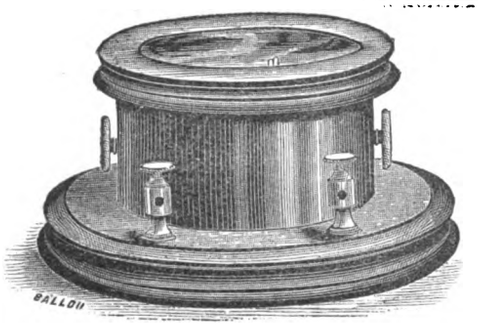
Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.

Repairers' Tools constantly on hand.

Importers and Dealers in best English and American Galvanized Wire.



Manifold Paper, for Train Orders, etc. Also, Agate Pens.

In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices.

M. A. BUELL,

Manufacturer and Dealer in

TELEGRAPH SUPPLIES.

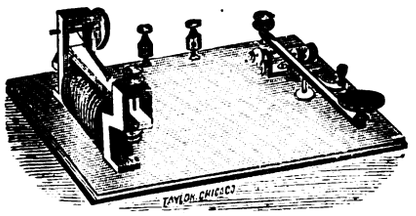
THE LITTLE MONITOR RELAY

Is a substantially made and good working Instrument, incased in a polished Rubber Cylinder with Plate Glass Cover, has back and front Adjustment.

EVERY INSTRUMENT WARRANTED.

Price, $12.00.

Also, LITTLE MONITOR SOUNDER, to match,
Price, $6.00.



And Small Size W. U. KEY,
Price, $4.00.

All kinds of Learner's Instruments, with Instructions, constantly on hand. Send for Circular.

M. A. BUELL,
26 WARING BLOCK,
CLEVELAND, O.

The Amateur's Telegraph Apparatus.

(PATENTED APRIL 16TH, 1872.

This is no toy, but a *bona fide* Telegraph Instrument, with a full-sized trunnion lever Key, with friction Circuit Closet and a Pony Sounder, both on same base.

The battery used is Hill's Patent Gravity Battery, which is considered to be the most constant and economical Telegraph Battery in use. A small size is made expressly for the above apparatus.

With each Instrument is furnished:

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners.

This is sufficient outfit for the student; and all can be set upon a table, or the battery can be set upon a shelf near the table.

In operating a short line, there will only be required, in addition to the above, more cups of battery, according to the length of line.

A Complete Outfit for a Telegraph Office,

WITH BOOK OF INSTRUCTION,

FOR

Seven Dollars and Fifty Cents.

GEO. H. BLISS & CO., Sole Agents,
41 Third Avenue, Chicago, Ill.

Putt's Mechanical Telegraph Instrument.

THE LECLANCHE BATTERY.

This Battery (the invention of GEORGE B. LECLANCHE of Paris) possesses great advantages over any other now in use, in its *great endurance*, its *cleanliness*, its *economy* and its *simplicity*.

We have now perfected arrangements by which we shall at all times be able to supply the rapidly increasing demand in this country.

PRICES:

No. 1, per cell,	*$2.25*
" 2, "	*1.80*
" 3, "	*1.75*

L. G. TILLOTSON & CO.,

Sole Agents for the Leclanche Battery Co.

Address of

LECLANCHE BATTERY COMPANY,

No. 40 West Eighteenth Street.

F. L. POPE & CO.

Manufacturers and Dealers in

Telegraph Instruments and Supplies

OF EVERY DESCRIPTION,

38 Vesey Street, New York.

New and Superior patterns of

STANDARD TELEGRAPH INSTRUMENTS.

Their RELAYS, SOUNDERS, and KEYS which have been specially designed by Mr. F. L. Pope, are elegantly designed, thoroughly well finished and scientifically adapted to the service required and are recommended as SUPERIOR TO ANY HITHERTO OFFERED.

In addition to these ALL DESCRIPTIONS OF TELEGRAPH MATERIALS AND SUPPLIES are furnished, such as

INSULATORS, BATTERIES,
INSULATED WIRES,
CHEMICALS., ETC. ETC.

MAGNETIC AND DIAL INSTRUMENTS.

We have for sale also THE NONPAREIL TELEGRAPH INSTRUMENT for amateurs, learners and short lines.

A COMBINATION SET, comprising Sounder and Key on a handsome rosewood base.

Bradley's Box Relays and Sounders.
Bradley's Apparatus for Electrical Measurement.
Bradley's Naked Wire Helices and Magnet Spools to order, any desired size and resistance, at manufacturers' lowest price.

Descriptive Circular and Price Lists forwarded upon application to

F. L. POPE & CO.,
P. O. Box 6010 *38 Vesey St., N. Y.*

THE LECLANCHE BATTERY CO.

Is now prepared to supply promptly the increasing demand for

This Celebrated Battery,

(SECURED BY LETTERS PATENT IN THIS COUNTRY)

and which is extensively used throughout Europe for

TELEGRAPHY,
RAILROAD SIGNALS,
HOTEL ANNUNCIATORS,
BELLS, ETC.

Among the numerous advantages of this Battery may be mentioned—

ENTIRE ABSENCE OF ACIDS,
ITS GREAT CLEANLINESS,
WONDERFUL DURABILITY,
GREAT ECONOMY IN RUNNING EXPENSES.

This Battery will last, without any Attention, from six months to a year.

A number of cups have been in use by the Western Union Telegraph Company, *on a closed circuit*, since Nov. 26, 1872, nothing but water having been added since they were first set up.

For further particulars apply to

THE LECLANCHÉ BATTERY CO.,

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 13. NEW YORK, JUNE 2, 1873. WHOLE NO. 134.

ELECTRO-MAGNETIC ENGINES.

Electro-magnetic engines are driven by means of the temporary magnetization of soft iron under the influence of a current. This magnetization can be destroyed or reversed with great rapidity; and it is thus possible to produce alternate movements of an armature, which can be readily transformed into other movements by ordinary mechanism. Since 1834, when Jacobi of St. Petersburg constructed the first engine of this kind, many other inventors have tried their powers in the same direction; but none of these attempts have been commercially successful, and the idea of employing such engines for any useful purpose is now almost abandoned.

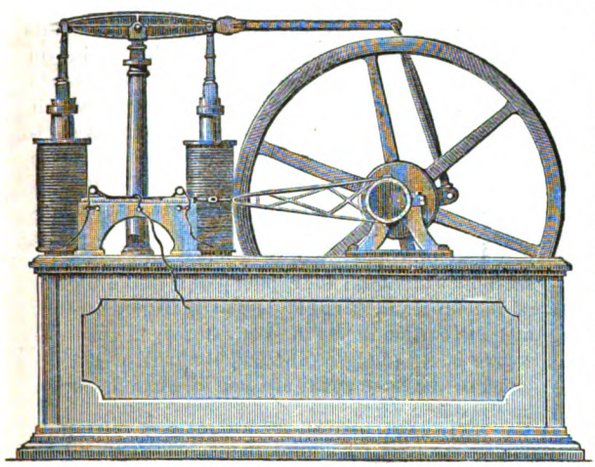

Fig. 1.

The chief reason for this want of success is the greater cost of the material consumed as compared with the fuel of other engines, A pound of zinc costs about fifty times as much as a pound of coal, and if the full equivalent in the form of work could be obtained, both for the coal burned in a furnace and for the zinc consumed in a battery, a pound of coal would yield four times as much work as a pound of zinc. Hence, if the "efficiency" (that is to say, the ratio of the energy utilized to the whole energy expended) of a heat-engine and of an electric engine be the same, the cost of performing a given quantity of work will be 200 times greater for the electric than for the other. It appears, however, that, as regards efficiency, the electro-magnetic engine may have an advantage of about 4 to 1. This would make its work only 50 times as expensive as that of a steam-engine.

Again, inasmuch as magnetic attractions decrease very rapidly with increase of distance, it is necessary for efficient working that the travel of the driving parts should be very small. This is inconvenient from a mechanical point of view.

Lastly, the movement of conductors in a strong magnetic field causes induced currents which strongly oppose the motion.

We shall proceed to describe two of the most successful electro-magnetic engines which have yet been constructed.

In the engine of M. Bourbouze (Fig. 1) the armatures have a reciprocating motion. There are two helices, having soft-iron cores in their interior for the lower half of their length. Two soft-iron rods or plungers travel up and down in the space above the cores, and are jointed to a beam which, by means of a connecting-rod and crank, turns a fly-wheel. The positive pole of a battery is permanently connected with a sliding piece of metal which travels to and fro horizontally, so as to be connected with a terminal of the left-hand or of the right-hand coil, according as it is on the left or the right of its middle position. The upper terminals of both coils are permanently connected with the negative pole of the battery. The reciprocating movement of the slider is produced by an eccentric on the axle of the fly-wheel, like the movement of the slide-valve in a steam engine.

In the position represented in the figure, the eccentric and slider are nearly at the extremity of their range to the left. The left plunger is then at the middle of its down-stroke. When it reaches the bottom, the sliding-piece will be in the center of its travel, and the left-hand coil will just have been disconnected. Immediately afterwards, the right-hand coil will be brought into circuit, its plunger being at the summit of its path; and it will continue in circuit till the plunger is nearly at the bottom. The electro-magnets are thus made and unmade whenever the eccentric passes its highest and lowest positions. On account of the shortness of the stroke, the beam is prolonged to a considerable distance before attaching to it the connecting-rod which drives the crank.

Figure 2 is an illustration of the rotatory engine

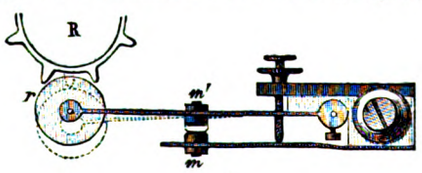

Fig. 3.

invented by M. Froment. It may be described as consisting of a wheel, with eight armatures of soft iron attached to its circumference at intervals of 45°, rotating under the action of four electro-magnets fixed to a cast-iron frame at intervals of 60°. Each magnet is "made" when an armature comes within 15° or 20° of it, and "unmade" as the armature is passing it.

The making and breaking of the circuits is effected by means of three distributors, one of which is shown on an enlarged scale in Fig. 3. R is an eight-toothed wheel, fixed to the axis on which the armatures revolve, and turning with them. Each tooth, as it passes the roller *r*, pushes it away, and brings the studs *m' m* into contact. As long as they remain in contact, the current circulates through the coil with which the distributor is connected. The distributors are screwed into a metallic arc, which is constantly connected with one pole of the battery. One of them serves for the two opposite horizontal magnets, which are made and unmade together. The two lower magnets have one distributor apiece. Matters are so arranged that the current is not cut off from one coil till just after it has commenced to flow in the next. This precaution prevents, or at least mitigates, the induction-spark, which generally occurs in breaking circuit, and which has the mischievous effect of oxidizing the contacts, and thus, after a time, deranging the movements.

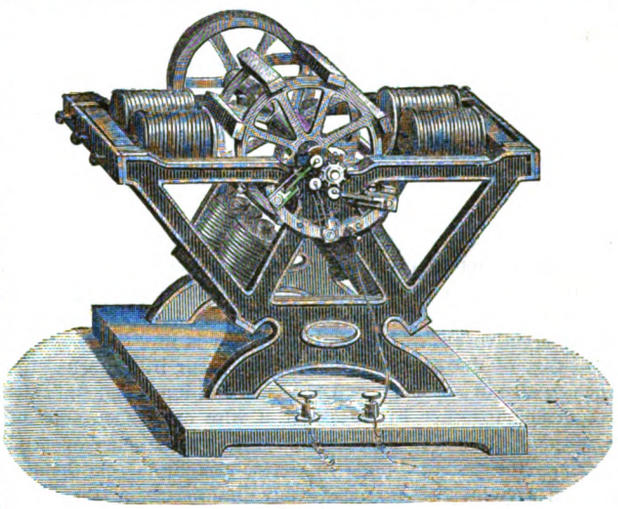

Fig. 2.

NEW ELECTRICAL INSTRUMENT.—Among the recent patents granted here is one to F. H. Varley, London, England, for a novel portable electrical machine. It consists of a glass or rubber rod, having upon it an exciting band or girdle of suitable cloth. A small Leyden jar is attached to the girdle. The rod is held in one hand and the girdle moved with the other. The friction of the girdle upon the rod excites electricity which passes to the jar, and thus a considerable quantity of electricity may be collected. It is a simple and apparently an effective instrument.

NEW CABLE BETWEEN HAVANA AND KEY WEST.—Captain J. Edward Hunter of the British Navy has just completed the work of laying a new cable between Havana and Key West. He used the cable ship Dacia, belonging to the Silvertown Company, and laid the entire new cable from Havana to Key West in fourteen hours, using only ninety-five miles of cable. The previous cables laid for this Company have never measured less than 125 miles. Capt. Hunter did this without any convoy.

ELECTRO-CAPILLARY CONSTANT CURRENT PILES.

By M. Becquerel.

I have given much attention to the subject of constant current piles since the year 1823, at which time there were none of the data necessary for their establishment. I presented several memoirs on this subject to the Academy of Sciences, and I constructed the first sulphate of copper and nitric acid piles, which I used for the reproduction of mineral substances. The porous diaphragm was merely a plate of pulverized kaolin; this was afterwards replaced by cylinders of half-baked and porous porcelain, which have since been generally used in constant current piles.

When I had discovered the principle of electro-capillary actions,—by which they cause, in the fissures of substances, the reduction of the greater part of the metals, and the production of different insoluble crystalized bodies analogous to those found in Nature,—I sought to apply it to the construction of electro-capillary constant current couples. I made many attempts before I attained the end I intended, in order to avoid counter-currents.

The fundamental principle on which electro-capillary actions depend is the property which the liquids adhering to the surfaces of the bodies, in the capillary spaces, possess of conducting electricity, as do metals and other solid conductors, in the same time that they are decomposed. The consequence of this property is, that when two solutions—one, for instance, of nitrate of copper, the other of monosulphuret of sodium—are found in contact in a capillary space which separates them, such as in a crack in glass, it produces an electric current along the partition in such a direction that the part in contact with the solution of the monosulphuret is the positive electrode, the other the negative electrode. This direction is inverse to that of the current which would occur if the space were not capillary, and the two solutions communicated together by means of a wire or a plate of platinum. This inversion of the current plays one of the principal parts in electro-capillary couples on account that it considerably diminishes the counter-currents. In the electro-capillary couple the deposit of copper is effected on the side of the fissure in contact with the solution of the nitrate; the current produced has great energy, for the resistance that it experiences is very feeble, it having to travel over only an exceedingly short length of liquid.

It is possible to construct two different couples that give the same result. The first couple consists of a glass test-tube containing a concentrated solution of monosulphuret of sodium, in which is plunged a cracked tube filled with a solution of sulphate or nitrate of copper; afterwards another tube was used, having at its base a plug of kaolin. In each of the two metallic solutions was plunged a plate of copper, which was put in communication with a wire of the same metal. There were two currents produced: in the cracked tube the electro-capillary current went from the metallic solution to the monosulphuret; in the second, the current took its rise in the plug during the reaction of the nitrate on the monosulphuret, following the same direction as the first, and adding to the reducing action of the electro-capillary current in the crack. The extremity of the plate of copper which was inserted in the plugged tube is the negative pole where the copper is deposited; the extremity of the other plate is the positive pole, which, in oxidising, renders the current constant when the solutions are maintained at the maximum of concentration. In uniting several similar couples by the poles of contrary name, we form an electro-capillary battery; with three or four couples water can be decomposed by means of two platinum plates. We shall study presently the properties of this battery.

We consider in a battery the electromotive force and the resistance. For the determination of the electromotive force we have used a pile with amalgamated zinc and sulphate of zinc, cadmium and sulphate of cadmium. It has been found that, taking for unity the electromotive force of this couple, that that of the nitric acid couple is evidently equal to five times its force; that of a sulphate of copper couple, three times; finally, the electromotive force of the electro-capillary couple, to 2¼ times; so that these three forces are nearly in the relation of 20, 12, 9; also that the electromotive force of the electro-capillary couple is three-fourths that of a sulphate of copper couple, and nearly half that of a nitric acid couple.

We now come to the second couple, which is more simple than the preceding, and which has the advantage of putting in evidence the causes of the electricity produced in the several parts of which it is formed. We take a test-glass filled with a saturated solution of nitrate of copper, into which we introduce a cracked tube containing a solution of an alkaline monosulphuret, and in this a tube filled with a solution of nitrate of copper; we apply to the exterior of the fissure of the cracked tube a very fine and very narrow band of copper, pierced here and there with little holes, *vis-à-vis* to the crack, so as to facilitate the access of the nitrate solution to that part. This plate is bound on the surface of the tube with a wire of the same metal wound in a spiral. We introduce into the plugged tube a plate of copper, which is put in communication with the wire of the same metal which surrounds the small plate of copper. Immediately, copper is deposited in the crack by the electro-capillary action, and finds itself in contact with the covering; it then acts only as a metallic arc traversed by the current produced in the plugged tube resulting from the action of the nitrate on the monosulphuret by the intervention of the kaolin plug. The two extremities of the metallic arc are covered with the reduced metallic copper, and yet if we pass the current through a galvanometer we see that the two extremities of the metallic covered with copper furnish to the current, the one positive electricity, the other negative electricity. The positive electrode is the end of the plate plunged in the plugged tube, and the negative electrode the extremity of the deposit of the copper in the crack which is in contact with the monosulphuret.

This last reacts upon the metal, whence results sulphide of copper, which is immediately decomposed by the electro-capillary current, with deposit of copper, which gradually increases, forming little protuberances. The plate and the copper-wire are covered equally with copper, because they are in contact with the copper of the crack, or, rather, are prolonged by it: it results from this that we cannot perceive which is the positive electrode. During the electro-capillary decomposition of the sulphide of copper, the sulphur gives itself to the monosulphuret solution, where it forms a polysulphuret, recognizable by its yellow color; in consequence of this reaction the copper of the fissure and of the plate constitute the negative pole of an electro-capillary couple. In the couple that we are describing there was no current produced, whilst there was a deposit of copper in the fissure; the other current is then, so to speak, independent of the first.

The effects produced in the couples, of which we have given the description, are easily explained as follows: The sides of the fissures being conductors of electricity, the current goes from the plugged tube into the fissure by the monosulphuret solution and by that of the nitrate; this direction is the same as that of the electro-capillary current, the action of which is augmented. From what precedes, we see that in electro-capillary couples the plates and wires of copper serve only to establish communication between the several parts of which they are composed. The production of electricity, and consequently of the current, is due to the reaction of nitrate of copper on the monosulphuret in the plug, and to that of the monosulphuret on the copper deposited in the fissure, giving place to a production of sulphide of copper, which is decomposed immediately by the electro-capillary current, this current following the same direction as the first, and causing its inversion. All the effects of which we speak cease when the fissure is not capillary—that is to say, when the copper deposited there becomes widened; in this case there are two currents, in contrary directions, which neutralize each other.

Further, I will describe another capillary couple possessing great energy, and producing at the same time crystallized metallic sulphides, namely, the sulphides of silver, copper, antimony, lead, &c. This couple is formed of a test-glass containing a solution of monosulphuret, in which is plunged two tubes not cracked, opened at the two ends, one of which is plugged with kaolin; the tube containing a solution of nitrate of copper and a plate of the same metal or of platinum or carbon. The other tube is also plugged at the inferior extremity, but with a band of paper wound very tightly around a cylinder, half of copper, half of a metal attackable by the monosulphuret; the copper part is in the interior of the tube and plunged in the nitrate, the other metallic portion in the monosulphuret; the plate of copper of the plugged tube and the part of the cylinder of the same metal are put in communication by a metallic wire.

Following this arrangement, the couple produces two currents in the same direction; the first takes its rise in the plug of kaolin; it enters the copper plate placed beneath (which is the negative electrode), then passes to the composite cylinder, the lower end of which plunged in the monosulphuret is the positive electrode. This is the second source of electricity: the current which it produces acts partly as an electro-capillary and partly as an ordinary current in the same direction as the first. The electro-capillary current exercises its chemical action in the paper plug very strongly. The portion of the plug on the side of the nitrate is filled with reduced copper, and the other side and the cylinder plunged in the monosulphuret are covered with crystals of metallic sulphide.

These couples can form a battery as in the preceding cases. An electro-capillary couple which permits of diminishing the resistance is composed as follows: We take seven simple couples, each surrounded with a small plate of copper; we group six around one in such a manner that all the coppers are in contact. These seven couples are introduced into a beaker containing a solution of nitrate of copper. All the conductors of the same metal which surround the exterior of the cracked tubes are put in communication, the tubes being filled with solution of an alkaline monosulphuret. There is adapted to to the exterior envelope of all the couples a metallic wire; this wire receives negative electricity, and the

Digitized by Google

central wire, to which is attached the wires of the plugged tubes, carries positive electricity. I have not yet experimented with this battery.

The couples already employed have an electromotive force for each one equivalent to three-fourths of that of a sulphate of copper couple; they present a very high resistance, so that it is better to unite the couples in quantity rather than in tension. It is found that the chemical action is great. The cracks cannot be replaced by porous diaphragms such as those in general use, for the reason that the latter are not sufficiently capillary.

In a future memoir I shall enter into details as to the means of augmenting the energy of electro-capillary piles.

PROPAGATION OF THE INSTANTANEOUS CURRENT OF THE LEYDEN JAR.

We are all familiar with the fact that a discharge of static electricity may be so rapid and instantaneous as to be incapable of inflaming a portion of gunpowder laid in its track; while, if this extreme rapidity be toned down or retarded by the interposition of high resistance, that explosion then takes place; and it is in that way we act, if we desire to get a measureable deflection through a galvanometer of a discharge from a Leyden jar.

Professor Gaillemin, of Saint Cyr, has recently investigated this subject from a new point of view, with novel and instructive results.

Instead of a galvanometer, the Professor ingeniously employed a "test-wire" of ·004-in. diameter (smaller than our ordinary No. 40° B W G), through which the current was passed, and which thus became more or less heated or fused. The battery consisted of eight large Bunsen cells, which excited a Rhumkorff coil, giving a spark of 13-in. length, and ten or twelve sparks generally charged a Leyden battery of six large jars, with a total surface of about 40-in. square. The tension thus produced was measured by means of a calibrated electroscope. The smallest interruption of the battery circuit stops all action, but this current from the Leyden battery was found to be not sensibly hindered by a layer of air of 1-100th of an inch in thickness. This current from the outer to the inner surfaces of the Leyden jars, was allowed to follow two paths. One "the test-wire," with its break of air-space capable of adjustment; the other consisted of two insulated uprights, carrying two transverse bars, which could be connected by fine parallel wires, by plates, or otherwise.

The experiments at the onset had reference to the "test-wire" circuit only; and a discharge was passed through it with complete metallic circuit, which instantly melted the wire. Another being replaced, its circuit was interrupted by an air-space, but on passing the charge, the wire was melted as in the first case. When the cut wires were terminated with metallic balls (leaving the same air-space as before) they were similarly melted, but the effect was greater when sharp points were substituted for the balls; and the air-space in this case could be considerably increased without the fusion being lessened.

Two inferences are drawn herefrom: 1st. That lightning conductors need not have a perfect continuity, and that thin layers of metallic oxide may with safety be neglected. 2d. That herein is one fundamental difference between the modes of propagation in the current of the voltaic battery and that of a Leyden jar.

With due respect to the Professor, however, it is at least doubtful whether there be any essential difference between the two currents in question, other than that of varied potential; for with 1,000 or more cells we can imitate all the tension effects of static electricity, or conversely we can tone down the impetuosity of a static discharge to give us all the ordinary properties of a voltaic circuit.

Next, as to the influence of the conductor surface: By using the two circuits he found that when the two cross-bars were united by a sheet of tin, 79 in. long and about 8 in. wide, a discharge now heated the test-wire shunt to a dark red. The tin was then folded on itself lengthwise, reducing the surface one-half. A discharge now heated the test-wire more than before. On farther folding the effect was increased, till at length the test-wire was fused. The fact became evident that in proportion as the tin plate was compacted into a solid of less surface its conductivity was diminished.

Similar results were obtained in other ways. The transverse bars being about 12 in. long and ¼ in. diameter, were connected by winding round several times from one to the other a metallic wire of about ·023 in. diameter (say No. 24^s B W G). Now, on passing a discharge the test-wire, about 3 in. long, was heated to a dark red; but on bringing the wires nearer together, and tying them with a silk cord, the test-wire was then fused. The plain inference herefrom is that currents in the same direction retard each other.

Other experiments gave additional proof of this. The transverse bars were connected by three wires A, B, and C, A and C equidistant from the middle B by a space of about 20 ins. It was also arranged that A and C contained each a piece of test-wire 3 in. long.

A discharge now heated both test-wires equally to a red heat, but on varying the postion of B it was found that when B was placed near C, then A was fused, and *vice versa*, and by the suitable variation of the apparatus the converse proposition was found to hold good, viz., that currents in opposite directions accelerate each other.

These are startling results, and opposed to all our preconceptions on the subject, but the Professor only speaks of them as applicable to the instantaneous currents of the Leyden discharge. However, it is important to observe that, however opposed to our ordinary conceptions on submarine telegraphy, yet they must apply to the inductive stage of all voltaic currents.

ON THE PROPAGATION OF HIGH TENSION ELECTRICITY.

By Count Th. Du Moncel.

The laws bearing on what is termed the "variable period" of the electric impulse are still subordinate to many conditions, some of them of a very complicated character. For this reason we find it impossible to specify or forecast them with any degree of certainty, and, consequently, it is only as they are developed by experience that we can ascertain their true significance.

One of the most curious, and perhaps also the most important of these reactions, is that which produces a change in the resistance of a conductor during the discharge of electricity of high tension through it—a phenomenon which was discovered by M. Guillemin in 1866.

It appears, in fact, from the instantaneous character of discharges of high tension electricity through a conductor, that the resistance of the latter appears to decrease as its surface increases. It would also seem that this remains true even though the section and mass of the conductor should be less than in the other case.

Considering that the laws of transmission in the permanent period are the same for static electricity and for voltaic electricity, evolved from a single cell, as proved by the experiments of M. Gaugain and others, we might well be surprised to find that the law of conductivity should be thus modified; but if we remember that, in the case of which we speak, the propagation is effected in so short a time that it is really but a very small fraction of the variable period, nothing in this phenomenon need longer continue a matter of surprise, since, with currents interrupted long before they have attained their maximum strength, the conditions of discharge are quite different from what they would have been had the interruption of the current occurred somewhat later.

This peculiar action in the propagation of the discharges, as regards electricity of high tension, in its relation to the diameter of a conductor, though very different from the ordinary cases presented, does not in reality form a single exception in itself, as may be inferred from what has been stated at the commencement of this article. The laws of the resistance of a conductor, in relation to its length, are also very different from what might be supposed, were we to consider only the laws governing the permanent period.

In 1868 M. Poggendorff demonstrated, by clear and precise experiments, that the currents from the Holtz machine, as well as those resulting from the discharge of Leyden jars, *are completely independent of the resistance* of a conductor through which they pass. Thus, whether the discharge is effected through a short metallic wire or a long wet string, the number of discharges in a given time remain always the same. The heat developed is also constant, and a galvanometer placed anywhere in the circuit continues to give exactly the same deflection.

Whether our solution is a true interpretation of the singular fact resulting from the discharge of electricity of high tension, in relation to the developed surface of the conductor, is a matter of comparatively little importance, if we are enabled to take advantage of the practical points which are placed in our reach.

In this case we have information which enables us to make an immediate application of them. From what has been said it would appear that we may advantageously employ thin metal sheets, with great breadth of surface, for the ground wires of lightning arresters, instead of the small wires now almost universally in use, since experiments show that the same mass of metal serves better for this purpose when rolled into a thin sheet than when drawn into wire of great section.

Production of Ozone by Electric Action.—*By M. A. Boillot.*—A current of dry air gave a mean of 20 to 21 milligrms. of ozone to 5 litres of air, which corresponds approximately to 1 litre of oxygen. A current of oxygen in the same conditions gave 7 milligrms. per litre. In further experiments the precaution was taken to remove any oxygen compounds by passing the air through a solution of caustic potash. The results were unaltered. Hence oxygen, in the condition in which it exists in the air, is more readily transformed into ozone in the proportion of 3 to 1 than pure oxygen gas. Another theoretical conclusion deducible from the above experiments is, that ozone cannot be a combination of oxygen with itself. The combination of several atoms of oxygen to form ozone seems to me to be a hypothesis no longer capable of being sustained.

Work is to be commenced at once on the Government Telegraph Line between Arizona City and San Diego, Cal.

CORRESPONDENCE.

ON THE RECEPTION OF MESSAGES.

To the Editor of the Journal of the Telegraph:

Without reference to the courteous treatment, obligatory on the receiving clerk, towards the customers, a few hints or practical directions to the inexperienced might be acceptable.

If the message *properly* pass through the receiver's hands, in respect to plain and intelligible orthography and sense, with clear and definite address, it will in all probability reach its destination satisfactorily.

It is advisable to have Christian names in full, because initial capitals are variously written and read, and thereby frequently transformed in transmission.

If the receiver notices initials liable to such results, he may prevent them by placing the Morse characters underneath them. This should be done in all running-hand copy, with such letters as *a*, *o*, *u*, *v*, *m*, *w*, &c., that are liable to misreading or misconstruction of meaning.

If nothing more than the name of the party addressed is given, more address should be requested, because to many persons the idea of difficulty or delay in finding persons does not suggest itself. Especially is this the case with people living in small places. The larger offices are constantly in receipt of messages without addresses, which, had this precaution been exercised, might have been obtained.

If the receiver has reason to suppose that a message is for a colored person, he should place the word colored on it; for, in its absence, the presumption is that the message is for a white person, and a colored person is never looked for.

A careful, intelligent receiver will read the message to the person presenting it (in such a tone, however, that other persons will not overhear), and he will correct any trifling errors of orthography (and, I would like to say, of grammar) that would mar the appearance of the message, or weaken confidence in its contents. He would, though, be careful not to interfere with *technical* terms or quotations.

The destination of messages is sometimes seriously interfered with through inadvertence, carelessness, or the want of intelligence on the part of both customer and clerk. Many a hamlet may have its telegraph office without its name being on the record.

As a general rule, it may be laid down that if the place be not on a line of railway that there is no telegraph office there.

If on a railway, the name of the railway will generally determine the location, route, tariff, &c.; and the statement that the message can be sent to the nearest office, and thence by train, will generally secure the message for the Company. In several of the railway guides the names of all railway stations are now put in a place by themselves, arranged alphabetically. If the clerk is in doubt about the tariff he can fully protect himself in a charge of five or ten cents above the known rate of an office near by. This, under the circumstances, could not be considered irregular or unreasonable.

For the better transaction of the business, and to save annoyance to the inexperienced, the Company's blank should have a few simple directions on them, such as the following:

"Write plainly; use no figures; give full address and date."

They should also have specified places on them, for the numbering and the timing of both receivers and operators. Perfection in the business is only to be reached through careful attention given to all these little, numerous, yet essential, details.

Information asked for in such questions as, "Did Mr. —— send a dispatch to, etc.?" should not be given. Serious injury might ensue through thoughtlessness or innocence in replying. The Company has no property or interest in the contents of a message further than is necessary to its proper transmission. Its agents are but intelligent machines.

W. W. KELCHNER.

Springfield, Ill.. May, 1873.

To the Editor of the Journal of the Telegraph:

Since the beginning of the discussion of the advisability of the adoption of the European alphabet, I have been struck with the unanimity of opposition thereto as evinced through your columns of correspondence. Enough has been said to show that operators, chief operators, managers and superintendents are almost a unit against the change. But let me ask every one of them a question or two.

Suppose you, an opposer—INDIVIDUALLY YOU—owned the controlling interest in the shares of the Company, and that you had become convinced it would add to reliability and accuracy, and that certainly no loss would entail, and perhaps a profit accrue through the adoption of the new alphabet—would you, or would you not, cause its adoption whether the employés were for or against?

While the privilege to discuss the question has been thrown open to five thousand employés, it cannot be denied that but a very small percentage of them are at all able to throw any light upon the subject; yet, as they may speak as with one voice *in opposition*, they may succeed in causing the rejection of that which, in calm deliberation, has been decided upon for the best good of those most deeply interested, without doing injustice to any one. The same case occurs in elections: the best man may be, and frequently is, unanimously rejected.

The fallacy as to the case politically is shown in that, while every one may vote, only a few are taken to counsel.

Had the Company convened fifty or a hundred from among the most intelligent and talented of its superintendents, managers, chiefs and operators, for the purpose of deliberating, and deciding from the results of such deliberation, the course as to what were best to do would have had sufficient light thrown upon it to admit of no doubt in the mind of those who alone have a right to decide. The fallacy of the course taken by the Company will be shown in this: should it now or hereafter decide to adopt the change, it will have to do so in the face of the open and expressed opposition of nearly every employé concerned. This would be a seemingly ungracious act, and for the Company a very unpleasant one, to perform.

Should it, however, retain the old alphabet solely on account of the opposition developed, the aspect, it must be acknowledged, will resemble that of a successful strike—successful, not because of the strength or justice of the employés or their cause, but successful because of the indiscretion on the part of the Company.

The employés would lose nothing by the change, either in time or money, and not more in labor and perplexity than in changing from railroad operating to commercial business, or from commercial business ordinary to arbitrary cypher—like "ycx, oicrm, xultye"—which latter kind is much used in great variety.

The ease with which each man will make the change will be according to his talent as an operator; and, as the amount of service which each is expected to perform is usually according to his ability to perform it, the task will fall quite equally—that is, it will be as easy for one as for another.

For my part, I count it no task at all. Though I have manipulated Morse for eighteen years, I have learned, in a few minutes, every new alphabet which has come out—that is, learned each thoroughly enough to make a start without danger of error or much hesitation.

The inconvenience or perplexity (almost altogether imaginary) is the only ground upon which an operator can base his opposition. He can make his work as surely correct as he pleases, and has authority from the President of the Company to do so, as shown in the Book of Rules. He is not responsible for the delay which may ensue to business on account of the change, if he has done his best to master the difficulty. The general result will show in what spirit each has worked, by comparison with others of his class of talent. The most unsuccessful will be successful enough, and the most stubborn will be tractable enough, to successfully make the change from the very start.

But first convene your talent and intelligence; deliberate with all deliberation; lay the verdict before the stockholders, and let the judgment be a fair and square Yes or No.

To do less, in so momentous a matter, would not be well. The decision will be accepted in the spirit it is given; therefore, let it be hearty and without a misgiving.

X. Y. Z.

NEW YORK, 19th May, 1873.

To the Editor of the Journal of the Telegraph:

Having held the position of operator in the British Postal Telegraph Service for some time, and having recently arrived in America, I wish to say a few words regarding the proposed change of Code.

Judging from the operators' letters on this subject in the JOURNAL, one would naturally imagine that they were consulting their own individual comfort, or *dis*comfort, in the matter, rather than that of the public. Most operators, no doubt, would prefer to work the Morse code, but if the Continental is a better safeguard against mistakes I think it is due to the public to use it. Telegraphy is becoming a necessity to merchants and business men, and there is no doubt, that for its proper growth and development, "bulls" are not at all essential. That it is not difficult to make "bulls" with the present Morse code is well known. I refer, of course, to the spaced letters.

To adopt the European system would, however, cause a great deal of confusion in the ranks. I would not consider this plan judicious, nor indeed necessary. The Continental, like the Morse, has some faults. The figures, for instance, are something terrible compared with the Morse. But it is quite clear to every right-minded operator that the spaced letters in the Morse code are daily causing mistakes, and the only remedy we have is to discard them entirely.

There is another thing I would say a word upon. When initial letters occur in a message, they are crowded on each other so fast that the operator is uncertain whether they are one word or single letters; and, should it be such as W. M., they are copied Wm. On the other hand, if a word is written slowly, it is divided into two or three initial letters, and, to complete the transformation, the remainder of it is joined to the next word; take for instance the case we heard of the other day, in which "Dry Goods Bank" was converted into "Dr. Y. Goodsbank;" or, again, "Wheeler, Fort & Co." was made to read "W. H. Olerfort & Co." With the Continental style this would never happen, because they write a full stop after each initial letter. The American ·-·-·-· is too long for this purpose, but let us take

Digitized by Google

the Continental -- -- -- instead, and follow strictly the rule of dividing initial letters, whether in address, body or signature, by this period, and I have no doubt that mistakes of this nature will be of seldom occurrence compared with the present.

I hope this will be commented on by operators interested in the matter. W. J. J.

DES MOINES, Iowa, May 17, 1873.

To the Editor of the Journal of the Telegraph:

Having read with great interest the communications on the alphabet change question, both for and against, I would say I fully concur with the great bulk (who, I am sure, have the best side of the argument), who believe the alphabet as it is can not be improved upon. The letter "Z" might be altered to advantage, but my idea is that good manipulation will fix the balance. The system that students are and have been taught by is bad; they pick their own way, and form an objectionable habit of making their letters badly, which sticks to them during life, and receivers pay for the "bulls" made; whereas if the sending had been good square "Morse," not one-tenth of such cases would occur. Some correspondents, whose patriotism over-balances their judgment, would not adopt the International alphabet even if they knew it was better. This is all wrong, and is worse than a poor argument. Another improvement, I am satisfied, could be made. Let the Executive Department issue an order that all checks shall be sent twice; thus: 10 paid paid, or 10 collect collect, as the case may be. I am satisfied that this simple rule would make a great change in the number of changed checks, which give all concerned a vast amount of trouble. G.

WAMEGO, Kansas, May 16, 1873.

To the Editor of the Journal of the Telegraph:

I will begin by saying that the Morse alphabet does not, in my opinion, stand greatly in need of change: certainly few American operators would willingly part with it for the horrible affair known as the Continental alphabet. Spaced letters are the one bad feature of ours—a source of annoyance to both sender and receiver. A good deal of guessing has to be done in cases where several of them come together, and guessing is certainly a risky business and an enemy to correctness. I have thought of two changes which might be made: doing away with the worst spaced letters we have—as follows: Let "c" be thus ——. , long dash followed by dot; the reverse for "r," thus . ——; the other letters and the numerals remaining the same. My observation, during nine years' practice, has convinced me that the letters above mentioned are the only ones needing to be changed; take them out and most errors would, I think, disappear. The distinction between "c" and "n" could be as easily and safely rendered as that between "l" and "t;" the same in the case of "r" and "a."

The beauty of our Morse alphabet consists in its brief and simple combinations. The changes I have indicated are easy, and can be readily acquired by the poorest operators. ALBERT FOLLATT.

To the Editor of the Journal of the Telegraph:

I am not in favor of adopting the International alphabet, but am in favor of changing the spaced letters and the letter "l," and making them as short as possible. As you wisely and justly say the system will be changed only for good and sufficient cause, I have no doubt that it will not be done without due consideration. BOUQUET.

To the Editor of the Journal of the Telegraph:

I am using one device, which I would like you to give to my fellow operators, for if it be tried on any telegraph line the advantage of it will be proven. By use of a switch, and proper connecting wires, I introduce into each main circuit the local battery used for the sounder, worked by the relay of that circuit (the + and — poles in the proper direction), making the usual connections with the local battery for working the sounder. The effect is, that by the use of the local battery in the main circuit, so near the relay, my relays work very strong in bad weather, because of the increased circuit applied just at the right time and in the right place. Of course the local battery acts upon the relay with its entire electro motive force, until the armature lever completes the local connection, when its current immediately takes the short route, and the sounder works with full force. No operator can detect any loss of power in the local sounder without the use of a galvanometer. In this manner we get a double use of our local batteries, for it is obvious that their current is not used in short circuit until the relay completes the local connections, and then there is no use for it in the main circuit until the main circuit is again broken; for the main battery keeps the relay closed until main circuit is again broken. We know that the power of every electro-magnet multiplies very fast as the armature approaches the cores; and for this reason, applying the local battery to the relay, in main circuit, until the local connection is completed, is just what is needed, and what makes the relays work to perfection. Let this simple device be applied to a wire 100 miles long, using 10 relays, and we add 20 local cells to the main line, which will prove the truth of the arrangement.

Lines using the Callaud main and local batteries will work beyond all expectation of operators who have never tried the experiment. I only ask you to try it and become convinced.

If you wish to add ½ to the power of your local cells of the Daniell's battery, procure a strip of dry wood, 1 inch wide, ¼ inch thick and 3 inches long, cut a hole through the centre of it large enough to slip on to the top of the zinc, then tighten your clamp-screw just far enough down to let the zinc hang suspended from the piece of wood in the porous cup, not touching it at any point. This entirely prevents all cross currents or local action in the cell, as it also prevents formation of copper upon the porous cups. Why can we not produce a shock from a galvanic battery unless the current first passes through an intensity magnet? It is a fact that we cannot. H. C. B.

Answer.—The arrangement you propose would no doubt have the effect of strengthening the main line current. We consider it preferable, however, to have a sufficient main battery power, and confine the locals to their proper functions. With ten offices arranged as you suggest, the strength of the main current would be constantly liable to variation, from the addition or withdrawal of 18 or 20 cups from the line.

You are mistaken in saying that a shock cannot be produced from a galvanic battery without passing the current through an intensity magnet. Very powerful shocks may be so produced, but with a given battery the intensity of the shocks may be increased by inserting an electro-magnet in the circuit. This result is due to the phenomena of induction. When an electric circuit is broken or closed, an induced current of much greater intensity than the primary current is momentarily established. This induced current is always present, but is much more marked when the primary current is caused to pass through the coils of an electro-magnet.

To the Editor of the Journal of the Telegraph:

Please explain why a local sounder put in a metallic circuit with a relay will not work, and why the relay will work and the sounder not be moved by the same current. If I take out the relay, and put another local sounder in its place, then the silent sounder begins to talk, and both sounders work all right. PATRICK.

Answer.—Other conditions being the same, the strength of an electro-magnet is in proportion to the number of turns of wire upon the spools. The coils of the relay being composed of a great many turns of wire, while those of the sounder are of comparatively few, the relay is affected more powerfully than the sounder when both are in the same circuit. With a second sounder in place of the relay, the total resistance of the circuit is greatly reduced, and the current becomes sufficiently strong to work the sounder before silent.

G. W. Howe.—With slight modifications, Stearns' Duplex would operate lines worked by Bright's Acoustic System, which uses both positive and negative currents.

L. E. Clark.—Four cells of carbon battery of the ordinary size are sufficient to work two sounders on a wire one-third of a mile in length, provided the sounders are properly constructed, and the wire has sufficient conducting capacity. In the case you present, the difficulty probably arises from the too great resistance of your iron wire, which you say is second-hand and old. If this resistance does not exceed six ohms, you should, with two sounders of three ohms resistance each, easily work with four cups of carbon.

Talladega.—There are thirteen words in the following:

"Send mail. Am much improved in health. How are all?

C. P.
Imperial Hotel. Answer."

Hernandez.—We cannot publish anonymous communications requesting the address of missing persons.

K. H. N.—If you are unable to send off a half-rate message during the time allowed for the transmission of such business, it should be sent at the earliest moment possible thereafter.

J. J. Smith.—Members of the Telegraphers' Insurance Association are notified of assessments by mail and through the JOURNAL.

W. H. W.—When application is made for a copy of a message which has been left with the Company for transmisson, it can be allowed under the provision of Rule 93, which states that "when the sender or receiver of a message applies in person, he will, if known or properly identified, be permitted to see or make a copy of his dispatch for himself." Read Rule 92 in this connection.

G. H.—Constant practice in receiving by sound, and legibly copying what you receive, is the only way of perfecting yourself as a sound operator. This practice you may obtain anywhere—in a commercial office, railway office, or in any place where you can hear the tick of an instrument. There is no royal road to learning telegraphy or any other art. Every man must travel the same path.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
June 1, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Jonesboro, Ga., re-opened.

Wesley City, Ill., closed.

Orford, Iowa, changed to Montour.

Messages may be taken for Wakefield, Mass., to be delivered from Reading, Mass. Charges for delivery, fifty cents.

Davison, Mich., re-opened.

Keytesville, Mo., closed.

Evans, N. Y., changed to Derby, N. Y.

Penn Yan, N. Y., is now a W. U. office, square 83. Check direct.

Lake Mahopac, N. Y., re-opened.

Trexlertown, Pa., is now a W. U. Office, square 66; check direct.

The P. O. A. of Hazardville, Pa., is Parryville, Pa.

Hereafter the "Tariff for Other Lines" from Sherman, Texas, to Bonham, Texas, will be 50 and 3, and to Paris, Texas, 6 and 4.

Clarendon Springs, Vt., re-opened.

NEW OFFICES.

286 Lowndesboro, Ala.
287 Tallasse, "
281 Newport, Ark.
* Bismark, Dac., 200 13 307 Chicago, Ill.
67 Southwood, Del.
376 Centre Point, Iowa.
407 Montour, Iowa.
223 Ewings, Ky.
269 Hart, Mich.
269 Mears, Mich.; check Hart, Mich.
332 Brookville, Miss.
322 Shannon, Miss.
120 Derby, N. Y.

Penn Haven Junction, Pa., the new office opened in last JOURNAL, should read Penn Haven, Pa.

ATLANTIC CABLE BUSINESS.

Tariff of Rates, Payable in Gold, to all Points in Great Britain Ireland and France, to take effect on and after June 1st, 1873.

NOTE.—The 10 word minimum on business to or from Great Britain and Ireland is abolished.

	To Great Britain & Ireland	*To France.*	
	For each word.	*For ten words or less.*	*For each word over 10*
From New York City, and all points in Nova Scotia, New Brunswick and New England States	$1.00	$10.00	$1.00
From all points in New York (except New York City), New Jersey, Pennsylvania, Delaware, Maryland and District of Columbia	1.03	10.30	1.03
From all points in Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan and Wisconsin, from St. Louis, Mo., and from Western Union Company's offices in Florida	1.15	11.50	1.15
From all points in Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dacotah, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California, Arizona, Oregon and Washington Territory	1.20	12.00	1.20
British Columbia	1.35	13.50	1.35

NOTE.—*The rates to points beyond Great Britain, Ireland and France*, will still be computed by adding to the rate for ten words to London, *as directed in the* JOURNAL of May 1st.

We are informed that messages can now be taken for the following places in Japan, at the rates, from London, here given:

	Via Falmouth or Teheran.	*Via Siberia.*
Simouosaki Hiogo, Osaka, Yokohama, Yeddo,	$37 62	$24 25

The Japanese Government will not accept any liability, under any circumstances whatever, for messages transmitted over their lines.

Offices which have recently received a notice of the interruption of the Cable between Madras and Penang, and the consequent change in rate to Singapore and other points, are hereby notified that the Cable has been repaired, and that the old rates will be resumed.

WILLIAM ORTON,
President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, May 31, 1873.

On and after June 16th, *East Tawas, Mich.*, will be added to the list of money order offices in E. P. Wright's district.

Wabash, Ind., in J. J. S. Wilson's district, has been closed as a money order office.

On and after June 16th *Goldsboro, N. C.*, will be added to the list of money order offices in J. R. Dowell's district.

G. H. MUMFORD,
Vice-Prest.

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

PRAIRIE CITY, Ill., May 13th, 1873.

D. R. DOWNER, *Esq., Secretary, New York:*

DEAR SIR: I notice in JOURNAL of April 15th that the T. M. L. Ins. Association is in a very prosperous condition; that the payments to heirs of deceased members amount to over eleven hundred dollars, and the prospects are that in a few years there will be such an army of members, and the deaths so frequent, that it will make a very costly insurance—more than any operator in ordinary circumstances wishes to carry. But this can be remedied by paying to the heirs of each deceased member a certain amount only, say one thousand dollars, and still make the usual assessment of one dollar at each death, until there is a surplus in the treasury sufficient to dispense with the assessment at the next death, and so on, always keeping a sufficient amount on hand to pay one death.

Please send me blank form for application.

Yours, &c.,

A. J. CLAYTON.

The views expressed above are not new to the Insurance Committee and other friends of the Association. In fact, the plan of limiting the payments to $1,000 was proposed some two years since by Mr. Orton in his letter to Mr. Reid, published at the time, in which he stipulated to add $100 to the sum paid by the Insurance Association to the heirs of such members as might die while in the service of the W. U. Co. The plan has been thought well of, and it is desired to bring it publicly before the members, with a view of eliciting discussion and an expression of opinion in relation to the subject. It is furthermore proposed to have it formally acted upon at the next annual meeting, in November, unless it shall be deemed of sufficient importance to call a special meeting before that time, for the purpose of considering it.

Our membership is large and rapidly increasing, and while the greatest care is now exercised in admitting new members (a physician's certificate being required in cases where the applicant is unknown to the officers or to an agent, or where there is any doubt as to his physical condition), yet the death rate, according to the natural laws of mortality, must necessarily be large, causing a heavy tax on many who are illy able to bear it. Various schemes have been proposed whereby the burden might be lightened, but none seem so practicable as this. One thousand dollars is generally conceded to be as large a sum as such an Association as ours should undertake to pay at each death. While there are many who would doubtless prefer a larger sum, and who, to secure it, would cheerfully respond to the more frequent assessments which would be necessary, there is little question that the great majority would be better satisfied with the certainty of receiving a stated, though smaller amount, at a proportionately diminished cost.

It is therefore recommended, that after a certain date, to be hereinafter named, the officers shall pay not over $1,000 to the family of a deceased member and the balance paid in under any assessment to be credited to the reserve fund, to be used, whenever the Committee direct, for the purpose of liquidating claims upon the Association arising from deaths, thereby rendering unnecessary the issuing of special assessments to meet the same.

The possession of a fund of this kind would be an element of strength, and merit for the Association increased confidence. Our reserve fund, which now amounts to over $1,500, has given us a stability and a reputation which it is very desirable to maintain, and the rapid augmentation which it would receive from these additions would secure to us a proportional increase of revenue from interest, which would soon more than meet the expenses of management.

It is hoped that all who feel an interest in this matter will give us an expression of their views. Extracts of sufficient importance will be made from communications which may be received, and published for the benefit of all.

D. R. D.

ACKNOWLEDGEMENT OF ASSESSMENTS, NOS. 39, 40 AND 41, TO MAY 24.

The acknowledgment of receipt of any assessment is to be understood as an acknowledgment for all previous assessments:

15	39	90	106	134	143	171	232	288	350	360
447	490	555	573	594	597	652	711	790	782	787
799	800	801	1008	1029	1187	1274	1275	1367	1374	1375
1380	1399	1497	1515	1519	1576	1637	1638	1676	1678	1718
1779	1782	1788	1784	1788	1801	1802	1819	1853	1865	

In response to the triple assessment of April 25, there has been paid in to the credit of each call as follows:

No. 39, for the benefit of the heirs of David Blackham, $1,124
" 40, " " " H. F. Thurber.... 1,166
" 41, " " " 1,278

Jacob M. Holdman, Certificate No. 1617, died of consumption, at Searcy, Ark., on the 28th ult. He leaves a wife and infant daughter. Although Mr. Holdman's death occurred before that of J. F. Dunlap's, which was announced in JOURNAL of May 1st the notice was not received until afterward.

Another double assessment will be issued immediately, to meet these deaths.

FOREIGN TELEGRAPHIC ITEMS

TELEGRAPH EXTENSION IN BRAZIL.

From Rio Janeiro, Brazil, under date of April 24th, we learn that "the coast cable matter has just been remodeled and a new contract signed with the Southern Submarine Telegraph Company, which bought the expiring concession, to Jones, Bright and others. The new concession relieves the Company from the obligation to touch at all the maritime provincial capitals—the obligatory ones being Rio Grande do Sul, St. Catharina, Santos, Rio, Bahia, Pernambuco, Maranham and Para. A year is allowed for soundings, etc., and the first section, from Rio to Pernambuco, is to be at work within two years, and the whole within five years. Land lines may be extended from the City of Rio Grande do Sul to the Uruguayan frontier, to join the lines of the Uruguayan Republic, but provision has been made for a junction with the Rio and River Plate Cable Company, and with any others thought useful. The Southern Telegraph Company has some 1,500 miles of cable ready, which was intended for a cable between Europe and the United States, but the present intent is to use it for the Brazilian coast line if the soundings do not forbid its use. The agents of the Telegraph Construction and Maintenance Company and the Southern Submarine Telegraph Company are returning to Europe, having completed their arrangements here.

CIRCULAR OF THE FRENCH CABLE COMPANY.

The following circular has been issued by the French Cable Company in reference to the amalgamation of the companies:

"The Anglo-American Company will increase its capital to 7,000,000*l.*, and purchase the French and Newfoundland Companies; in this total capital 3,451,550*l.* will represent the capital of the French Company (now 1,650,000*l.*); 2,548,450*l.* will represent the capital of the Anglo-American Company (now 1,675,000*l.*); 1,000,000*l.* will represent the capital of the Newfoundland Company (now 864,520*l.*); total, 7,000,000*l.* This company's new cable will now be laid from Valentia to Heart's Content, Newfoundland, and from Placentia to Sydney (Cape Breton), in place of from Land's End to Halifax and New York. The shareholders in this company will receive for each present share of 20*l.* about 41*l.* 15s. in the shares of the amalgamated company, subject to the payment by this company of its existing debenture debt and the expenses of the liquidation, which may be estimated in round figures at 5*l.* per share. As, however, the saving in cable, &c., made by the change of route, will be considerable, two-thirds of which saving will accrue to the amalgamated company and one-third to this company, it is expected a portion of this 5*l.* will be provided for. The Newfoundland Company reserves its own land rights, and of the 1,000,000*l.* accruing to it in the amalgamated company, 135,480*l.* will be placed in trust, to be handed over to the Newfoundland Company at the expiration of two years, should none of its present exclusive rights and privileges be withdrawn; otherwise said 135,480*l.* will revert to the amalgamated company. The shareholders will be summoned together with the least possible delay."

A DESPATCH dated London, May 28, states that a bill has been filed in Chancery against the Anglo-American Cable Company to prevent the amalgamation of its stock with that of the Newfoundland and the French Atlantic Telegraph Companies.

CHINESE INTEREST IN TELEGRAPHY.—The Great Northern Telegraph Company have been erecting in Amoy a short telegraphic line between their offices and the American Consulate. Their idea was to give the Chinese authorities a practical illustration of the working and value of the telegraphic system, and at the same time pave the way for its fuller introduction into the country. They accordingly, when the line was completed, invited the Mandarins to visit their establishment, and see for themselves the way in which messages were transmitted, etc. None of them, however, would attend, and the end has been that the whole thing has been pulled down.

THE traffic receipts of the Great Northern Telegraph for the month of March amounted to 242,769 fr. (£9,711), against 198,884 fr. (£7,958) for the corresponding month of last year.

THE Austrian Minister of Trade has given notice of his intention very shortly to adopt the system of adhesive stamps for the pre-payment of telegrams, and at the same time to reduce the charge for messages, from one station in the Austro-Hungarian Monarchy to another, to one uniform rate of fifty kreutzers.

THE total number of telegraph messages forwarded from postal telegraph stations in the United Kingdom for the week ended April 19, 1873, was 311,323—an increase on the corresponding week of the previous year of 35,974.

THE telegraph cable between Martinique and Dominica was repaired, and resumed operations March 20th.

THE declared value of telegraphic wire, and apparatus connected therewith, exported from Great Britain for the three months ending March 31st, was £106,227, against £29,859 in the corresponding period of the previous year.

A STATEMENT has been published showing the average receipts per day of the Atlantic Telegraph Company. In 1866, they average £747 per day; in 1867, £897; in 1868, £936; in 1869, £906; in 1870, £1,278; in 1871, £1,650; in 1872, £1,885 per day. It will be seen, therefore, that with increased facilities and reduced tariffs, the business of the Companies has largely increased. Last year the Companies must have forwarded 9,425 words per day.

THE report of the Brazilian Submarine Telegraph Company states that the order for the cable has been given to the Telegraph Construction and Maintenance Company, and that, up to the date of the report (April 25), 469 miles, according to the certificates of the Company's engineers, have been manufactured. Satisfactory working arrangements have been entered into with the Eastern Telegraph Company for the transmission of the Company's messages to Great Britain and the East, and similar arrangements are in course of completion, with the Great Western Telegraph Company, for the transmission of their messages, subject to that Company establishing a complete system of telegraphic lines along the coast of Brazil.

THE *Auckland* (New Zealand) *Cross* says:—The successful progress of the telegraph department in New Zealand is a proof how a public want once supplied grows into use. Many will remember that some people condemned the telegraph as a luxury with which New Zealand could easily dispense. A few years have passed, and it has become a necessity, just as our railways are doing where in working order, so that people now wonder how we could have so long existed without them.

MR. J. C. FLEMING has been appointed Superintendent of Telegraphs for Western Australia, and the Government has fixed the telegraphic tariff at one shilling per ten words between any two stations throughout the colony.

THE Peruvian Congress has agreed to authorize a guarantee of five per cent. on a capital of half a million soles, for the construction of a sub-marine telegraph between Payta and Panama.

THE telegraph line to Lota, Chili, was to be completed on the 1st of May.

AN AIR BATTERY.

Drs. J. H. Gladstone, F. R. S., and Alfred Tribe recently read before the Royal Society a paper on a new air galvanic battery, constructed on the principle that if pieces of copper and silver in contact are immersed in a solution of nitrate of copper in the presence of oxygen, a decomposition of the salt ensues, with the formation of cuprous oxide on the silver and a corresponding solution of the copper, while a galvanic current passes through the liquid from copper to silver. To employ the oxygen of the atmosphere and facilitate its contact with the silver and dissolved salt, the silver plate is placed in a horizontal position just under the surface of the liquid, with the copper plate beneath it, connection being established by a wire as usual. Holes are made in the silver tray to shorten the communication between the air surface and the copper plate, and to facilitate the movements of the salt in solution.

The conclusions determined are briefly as follows: The current gradually diminishes on account of the rising up of the dissolved oxygen in the neighborhood of the silver, but is augmented by merely moving the liquid so as to bring fresh parts of the solution against that metal. A similar result is gained by stirring the silver crystals so as to expose new surfaces. If the wire be disconnected for a time, so as to allow the oxygen to diffuse itself from other parts of the solution, and if the connection be again made, the current is found as strong, or nearly so, as before. Oxygen is taken up with the greatest avidity, the solution absorbing even minute quantities from the surrounding gas. Six per cent was found to be the best strength of the copper nitrate solution. As regards the best proportion between the areas of the metallic surfaces, the increase of the copper has little effect, while that of the silver, the negative metal, causes an almost proportionate increase in the chemical action. Heat increases the action of the cell greatly, the augmentation being more rapid in the higher than in the lower ranges of temperature, from 68° 122° F. The internal resistance of the battery is small. As to the electrolytic power of the current, six cells were sufficient to decompose dilute sulphuric acid slowly, and dilute hydrochloric acid pretty quickly, copper electrodes being employed.

The theoretical interest of this battery lies mainly in the fact that it differs essentially from every other galvanic arrangement, inasmuch as the binary compound in solution is incapable of being decomposed either by the positive metal alone or by the two metals in conjunction; it cannot serve, in fact, as the liquid element of the circuit without the presence of another body ready to combine with one of its constituents when set free. The practical interest centers in the fact that the device is an approximation to a constant air battery. By employing chloride of zinc, power may be obtained at a minimum of expense. Such a battery would appear to be specially adapted to cases where the galvanic current has to be frequently broken, as in telegraphy; for, at each period of rest, it renews its strength by the absorption or diffusion of more oxygen from the air.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,

Western Union Telegraph Company,

145 Broadway, New York.

NEW YORK, JUNE 2, 1873.

DUE CREDIT.

It has come to our knowledge that the article in the last issue of the JOURNAL, relating to the efficiency of the Western Union Company's lines and service, has conveyed an impression which was not intended. It was mainly designed to indicate the valuable results which have followed the application of accurate scientific knowledge to the various departments of the Company's business, and especially in perfecting machinery and instruments, the arrangement of batteries, and in increasing the efficiency of the lines. It was not intended to give credit for the exhibition of greater zeal, energy and efficiency by those connected with one branch of the service, than by those connected with other and equally important branches. The work of constructing and maintaining the lines is now, as it has been heretofore, under the charge of District Superintendents, subject to the immediate supervision of the General Superintendent, in each Division, who is held responsible for their condition.

Especial credit is due to these officers in all the Divisions for the manner in which their work has been performed during the past few years. Much credit also belongs to the Managers of principal offices, some of whom have become skillful electricians, and also to district foremen of construction and repairs, for the excellent results which have been steadily developing, rendering the Western Union lines, and the work performed thereby, as efficient, prompt and reliable as any in the world. The operators are also deserving of mention in this connection. They are doing more and better work than ever before, and give gratifying evidence that the JOURNAL is accomplishing, steadily and surely, the objects for which it was established.

SUPERINTENDENTS frequently have occasion, in the performance of their duties, to instruct subordinates as to the provisions of Executive Order No. 125. To save the labor of copying it by pen, we re-produce it. In future, reference to this number of the JOURNAL will answer the desired end.

PREVENTION OF UNNECESSARY OFFICE MESSAGES.

In December, 1869, the following circular was sent to all offices in the Pacific Division by Mr. Geo. H. Mumford, then the General Agent of the Company in that territory. The provisions of the circular are still in force there, and are found to be of much advantage in the prevention of unnecessary service messages. Working so well, they might, with good result, be put into operation in the other divisions, and, while not desiring to make an order to effect this, the officers of the Company are favorably inclined to the course indicated:

"The mass of unnecessary 'office correspondence' by telegraph is a great and constantly increasing evil. The wires are loaded down; a greater force is necessary, and commercial business is delayed. The evil was glaring when our tariffs were two or three times higher, but since the heavy and universal reductions lately made it has become intolerable. It is impossible to maintain these low rates, if, as in some instances lately, four or five messages are to be sent in regard to a single 25 cent message, which has been duly and promptly delivered.

"All correspondence with officers of the Company and its various departments, or with other officers relative to checks, etc., should be *by letter*, and *never by telegraph*, except for matters too urgent to bear the delay of mails.

"Where a message calls for an answer, it is the duty of the delivery office to make every exertion to obtain a reply immediately. This duty is almost always complied with, and the presumption in each case is that it has been done. Where prompt answers are not obtained, it proves, in nine cases out of ten, to be the fault of the party to whom the message is addressed, and it is not proper that we should thereby be subjected to the expense of office correspondence; therefore, when the lines are in their usual good working order to the places where messages are addressed, and the senders desire any information relative to delivery or answers, they are to be charged ordinary rates for office messages. It is desirable that the customers should send the messages of inquiry in their own names, either to their correspondents or to our agents. If it is ascertained that the Company has been in fault, the entire tariff paid for the original message and subsequent correspondence relative thereto will be refunded; *provided*, however, that the Company is not to be considered as in fault if the parties to whom messages are addressed cannot be found.

"The object of these rules is to cut off unnecessary telegraphing, for the benefit of the public, and to increase the efficiency of the service.

"Every needless inquiry upon the part of one customer delays the business of somebody else."

REDUCTION OF ATLANTIC CABLE RATES.

Following the repair of the French Cable, the rate from New York City to any point in Great Britain and Ireland is reduced to one dollar per word, and to France ten dollars for ten words. The rates now are the same that existed prior to May 1, 1873, but the rates to points beyond Great Britain and France, which have heretofore been computed by adding to the rate to France, will hereafter be found by adding the same amounts to the rate for ten words to London.

OBSERVE THE RULES.

Were the regulations which govern the service of the Company more generally observed and carried out, particularly those concerning messages which require answers, much unnecessary labor, and some little annoyance, both to customer and employé, would be saved. Rule 13, one of the most important, seems to be regarded as almost a dead letter. Were it properly observed, the revenue of the Company would be materially increased, while the labor of operators and clerks would be greatly lessened. It is not just that whenever a person fails to return an answer to a message which he has received, the Company should, without charge, be at the trouble and expense of again sending to the negligent receiver, besides transmitting two office messages, each one costing them as much to transmit as the original message. The obligation of the telegraph company ceases when it has delivered a message. Procuring an answer is in no sense part of the contract, and it is only in a spirit of accommodation to its customers that the endeavor is made. Extra service in this direction should be charged for, and the rule provides for this in the cheapest and most satisfactory manner.

Rule 13 reads:

"Whenever a person sending a message desires to know that his correspondent has received it, such information may be furnished to him from the manager of the office to which the message is transmitted at one-half the usual rates. In such cases the signal "34" will be sent with the message, signifying that the sender wishes a reply from the manager of the office at the place of its destination, stating whether the message has been delivered to his correspondent or not."

THE NEW TARIFF OF RATES.

The new Tariff of Rates, which is to go into effect July first, is now about ready for distribution.

The change contemplated by the new rates is a general reduction and simplification of the tariffs.

Under the present system each Division has a separate scale of rates for its own offices. Besides these, there are three others applied in ascertaining rates between Divisions; the arbitrary local rates between offices of one Division and those of another; and such old rates, in use previous to October, 1869, as were retained by special orders. The present special rates will be changed only by the substitution of the new scale rates whenever the latter are found to be the lower.

In order to harmonize, as far as possible, these different and often conflicting scales and rates, and at the same time work a general reduction in the tariff, it was decided to adopt the scale now about to be put into operation.

With one exception (a single rate in the Eastern Division), no increase will be made by the new rates. The adoption, therefore, of a scale which will secure uniformity, must accomplish a great and general reduction, as will be seen from a comparison of the rates now in use with those proposed:

Digitized by Google

LOCAL RATES.

	25 *miles.*	50 *miles.*	75 *miles.*
Eastern Division, North and East of New York State...	25c.	30c.	35c.
Eastern Division, South and West of New York, and Central Division.....	35c.	45c.	55c.
Southern Division.....	35c.	50c.	50c.
New Local Rates.....	25c.	30c.	(sqr. rate.)

The local rates, for points between 50 and 75 miles distant from any office, will be discontinued.

SQUARE RATES.

Squares	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Eastern Division	35	40	55	70	80	90	100	110	120	130	140	150								
Central Division	55	65	75	85	100	110	120	130	140	150	160	170	180	190	200	210	220	230	240	250
Southern Division	50	65	75	90	100	120	135	150	165	180	200	220	240	250	250	250	250	250	250	250
New Rates	40	40	50	50	75	75	75	75	100	100	100	100	125	125	125	125	150	150	150	150

Each square represents a distance of fifty miles.

At present there is a rate for nearly every multiple of five between twenty-five and two-fifty. Under the new scale there are but ten different rates, and all but the 30c. local rate, and the first square rate, 40c., are multiples of 25.

A sufficient reason for the increase of the 35c. rate in the Eastern Divisions will be found in the greater uniformity thereby attained.

Some slight departure from the new scale is made in the rates of points in the Central Division west of the Missouri River, but in every case there is, nevertheless, a considerable reduction.

SERVICE CORRESPONDENCE BETWEEN OFFICES.

The postal cards seem to be well adapted for error sheets and for almost every other kind of correspondence between offices. Managers should take advantage of this convenience in all cases where the service will not suffer by the delay. In this way the wires can be materially lightened of their burden of office messages.

IMPROVEMENT IN STOCK REPORTING INSTRUMENTS.

The Gold and Stock Telegraph Company have, by improving the form of their instruments, practically doubled their speed of transmission. One circuit, working a dozen of the improved instruments, is now in operation from the headquarters of the Company, No. 61 Broadway, and has proved so successful, that as rapidly as instruments can be changed from the old form to the new, they will be substituted for those now generally used.

CUTTING THE TELEGRAPH WIRES.—One night last week some one cut the telegraph wire between Hoboken and Union Hill, N.J., stretching the wire across the horse-car tracks, about six feet from the ground. One of the car drivers was caught by the wire, and would probably have been killed had the car been moving as rapidly as was customary at the spot where the trap had been laid.

E. S. FERRERO, one of the cable receivers at 145 Broadway, New York, died May 24. He joined the Insurance Association in January, 1872, but dropped out after having paid nine assessments. Consequently, his family will receive no benefit from his connection with the Association. Mr. FERRERO was an accomplished linguist, being able to converse fluently in six different languages. He became connected with the French Cable when the line first opened for business, and upon the consolidation of the cable companies was retained in the service, in which his linguistic abilities were frequently of great usefulness.

A SAN BERNARDINO, California, correspondent of the *San Diego Daily Union*, states that Mr. James Gamble, Superintendent Western Union Telegraph, visited that place the other day, with reference to an extension of the telegraph from Anaheim to San Bernardino. At a meeting of the citizens a proposition to raise $2,500 in aid of the line was in favor, and a committee appointed to solicit subscriptions had already obtained $1,500.

DURING a fight in the streets of the City of Panama, which occurred in the last revolution in the State of that name, and which has just been brought to a close, the telegraph office was perforated by ten bullets. One struck the wall immediately over the head of the operator, and at the same moment another smashed his local battery.

THE Gold and Stock Telegraph Company, of this city, declared a dividend of three per cent. on the 22d of April.

THE French Atlantic Cable, which was broken 208 miles from Brest, has been repaired.

EXECUTIVE ORDER No. 125.

On and after the first day of July, 1871, all messages relating to the affairs or business of the United States, except the weather reports and those relating thereto, offered for transmission by any of its civil or military officers or agents, will be received without pre-payment being exacted, and will be forwarded promptly, priority being given them over all other business. The tariff on such messages will be computed as follows: One cent per word for each two hundred and fifty miles or fractional part thereof. All words to be counted, except the date and the place where the message is filed; provided, however, that no message shall be counted as less than twenty-five words. Distances will be computed by the tables of the War Department, which tables will be furnished to all offices where Government messages are regularly filed. Until so furnished, distances can be ascertained by inquiry of the New York or Washington office. All such business will be entered as paid at the office where it originates, and the bills will be presented monthly as heretofore. In cases of inability to collect, a duplicate of the account, and the originals of messages, will be forwarded, with the monthly account current, to the auditor, credit being taken therefor as cash.

WILLIAM ORTON,
President.

QUARRELING BY TELEGRAPH.

From the Springfield Republican.

Jack Hurley, formerly a telegraph operator in this city, is in the Worcester jail for a little indiscretion, illustrating the peculiarity of his business. Jack was receiving in the Framingham office, and once or twice had to ask Worcester to repeat. Worcester did so, and volunteered the information that Framingham was a fool on whom it would be delightful to put a head. Straightway the wire from Framingham spoke, "I'm coming;" and unable to wait for a passenger train, the impetuous sender took a freight train, and presently arriving, gave Worcester a great drubbing, for which he was imprisoned as above. Now, however, from all over New England comes to Worcester the anxious inquiry, How's your head?

AN Act incorporating the New York Underground Telegraph Company has been passed by the Legislature and signed by Governor Dix.

AMONG the philosophical apparatus at Dartmouth is a battery of thirty-six cells, which was used by Franklin in his celebrated experiments. It has quite a history, having been brought to America by Dr. Priestly at the time of the Irish riots. After Franklin owned it, it fell into the hands of Dr. Prince, of Salem, and finally was obtained by the grandfather of Professor Young, who at present has it in his possession.

BORN.

HOWIE.—At Pewamo, Mich., May 15, 1873, a son to David Muir Howie, Agent and Operator.

LANGHORNE.—At Indianapolis, Ind., May 16, 1873, a daughter to A. T. Langhorne, of the W. U. Tel. Office.

MARRIED.

LEE—MATTHEWS.—At Trenton, N. J., May 7, 1873, by Rev. A. Lawrence, Edward A Lee, Operator at Hazleton, Pa., to Miss Frances P. Matthews, of Titusville, Pa.

NEW INSULATING SUBSTANCE.

Mr. Highton communicates to the *Chemical News* the result of his experiments in search of a compound as a substitute for gutta-percha for insulating purposes. If the result of his experiments is borne out by practical tests, it certainly will have an important bearing on the future of telegraphy. The following is his letter:

"Some time ago I discovered, in the course of experiments, that vegetable tar, by the addition of the oxides of lead (or in a less degree by some other substances), is almost instantly solidified, and that the solid substance thus obtained has remarkable insulating powers.

"In some experiments at Silvertown, I found that No. 18 copper wire, covered with a coating of gutta-percha weighing only 21 lbs to the mile, had its insulation increased nearly 200,000 per cent, and that the insulation resistance increased nearly 2,800,000,000 units, an insulation sufficient for any lengths possible on the surface of the earth.

"Insulation of so great cheapness makes all further experiments on telegraphy without insulation needless, though in fresh water or by land this can be effected to very great distances.—I am, &c.,

"H. HIGHTON.

"*Putney*, April 30."

NOTE ON THE EFFECTS PRODUCED BY CURRENTS ON MERCURY IMMERSED IN DIFFERENT SOLUTIONS.

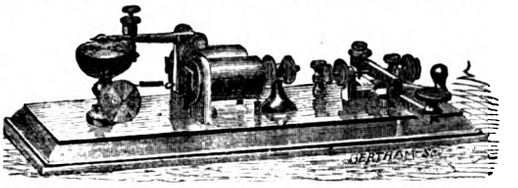
Th. du Moncel.—When the current from a battery of 8 Chutaux elements is passed through spring-water for an electrolyte—the electrode being a large drop of mercury connected with the negative pole, and a platinum wire with the positive—the polarization current, on closing the secondary circuit after five minutes action of the battery, and through a circuit of 12 kilometres of telegraph wire, has at first an intensity represented by 7 or 8 degrees on a zinc galvanometer with two spirals of wire. This current gradually disappears in three minutes. With acidulated water the effects are less. With a saturated solution of chloride of sodium (other conditions the same) the polarization current had at first an intensity of 25°, disappearing in fifteen minutes. With potash solution (salt in proportion of a fourth of weight of water) primary strength 26°; disappeared in fourteen minutes. With 3 per cent. solution of cyanide of potassium, 18° 45'; twelve minutes. With solution of chlorhydrate of ammonia, 45° to 50°; five minutes. Thus, we may form with these solutions gas couples and batteries of polarization more energetic than those which have for base oxygen and hydrogen.

WATTS & COMPANY,

Baltimore,

MANUFACTURERS OF

Electrical and Telegraph Instruments



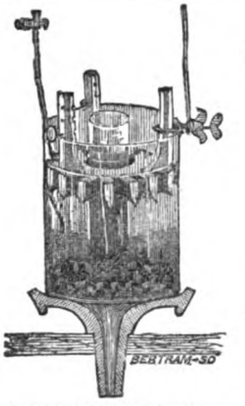
AND

MATERIAL OF EVERY DESCRIPTION,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER.



ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

SOLE MANUFACTURERS OF THE

NEW PATENT BALTIMORE BATTERY

MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7½ inches,
Specially adapted to Railroad Signals, Printing Instruments, etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country having proven the cheapest, and least trouble to maintain of any in the market.

Patented Dec. 31, 1872.

ALSO, SOLE MANUFACTURERS OF THE

Patent Circuit Closer Key,

O'Sullivan Self-closing Key,

Scott's Patent Hotel Annunciator

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE

PATENT BATTERY INSULATOR

shown, holdin a cup of the Baltimore Battery in the above cut, which most effectually insulates the Battery as the drip passes off *thr ugh a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. PRESCOTT, says of it:—"I think your Battery Insulator a very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.

Repairers' Tools constantly on hand.

Importers and Dealers in best English and American Galvanized Wire.

MANIFOLD PAPER, for Train Orders, etc. Also, AGATE PENS.

In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices.

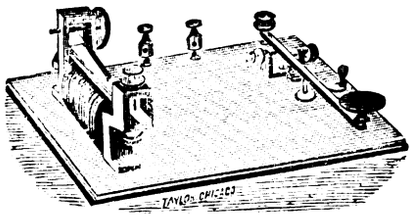
GALVANIZED AND PLAIN WIRE,

INSULATORS,

AND EVERY DESCRIPTION OF



OFFICE AND BATTERY MATERIAL

ALWAYS ON HAND.

INSTRUMENTS REPAIRED AT SHORT NOTICE.

The Amateur's Telegraph Apparatus.

(PATENTED APRIL 16TH, 1872.

This is no toy, but a *bona fide* Telegraph Instrument, with a full-sized trunnion lever Key, with friction Circuit Closer and a Pony Sounder, both on same base.

The battery used is Hill's Patent Gravity Battery, which is considered to be the most constant and economical Telegraph Battery in use. A small size is made expressly for the above apparatus.

With each Instrument is furnished:

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners.

This is sufficient outfit for the student; and all can be set upon a table, or the battery can be set upon a shelf near the table.

In operating a short line, there will only be required, in addition to the above, more cups of battery, according to the length of line.

A Complete Outfit for a Telegraph Office,

WITH BOOK OF INSTRUCTION,

FOR

Seven Dollars and Fifty Cents.

THE

LECLANCHE BATTERY CO.

Is now prepared to supply promptly the increasing demand for

This Celebrated Battery,

(SECURED BY LETTERS PATENT IN THIS COUNTRY)

and which is extensively used throughout Europe for

TELEGRAPHY,
RAILROAD SIGNALS,
HOTEL ANNUNCIATORS,
BELLS, ETC.

Among the numerous advantages of this Battery may be mentioned—

ENTIRE ABSENCE OF ACIDS,
ITS GREAT CLEANLINESS,
WONDERFUL DURABILITY,
GREAT ECONOMY IN RUNNING EXPENSES.

This Battery will last, without any Attention, from six months to a year.

A number of cups have been in use by the Western Union Telegraph Company, *on a closed circuit*, since Nov. 26, 1872, nothing but water having been added since they were first set up.

THERMO-ELECTRIC CURRENTS.

Electric currents can be produced by applying heat or cold to one of the junctions of a circuit composed of two different metals. This was first shown by Seebeck of Berlin, in 1821. It may be illustrated by employing a rectangular frame (Fig. 1), having three sides formed of a copper plate, and the fourth of a cylinder of bismuth. It must be placed in the magnetic meridian, with a magnetized needle in its interior. On heating one of the junctions with a spirit-lamp, the needle will be deflected in such a direction as to indicate the existence of a current, which, in the copper portion of the circuit, flows from the hot to the cold junction, and in the bismuth portion from the cold to the hot. If cold instead of heat be applied to one junction, the direction of the current will still be from the warmer junction through the copper to the colder junction, and from this through the bismuth to the warmer junction. Antimony, if employed instead of copper, gives a still more powerful effect.

Though a circuit composed of bismuth and antimony is specially susceptible of thermo-electric excitation, the property is possessed, in a more or less marked degree, by every circuit composed of two metals, and even by circuits composed of the same metal in different states. If, for example, a knot or a helix (as in Fig. 2), be formed in a piece of platinum wire, and heat applied at one side of it, a current will be indicated by a delicate galvanometer. In metals, which are usually heterogenous in their structure, such as bismuth, it is not uncommon to find currents produced by heating parts which appear quite uniform. If the ends of two copper wires be bent into hooks, and one of them heated, on placing them in contact, a current will be produced due to the presence of a thin film of oxide on the heated wire. With two platinum wires, no such effect is obtained.

According to Becquerel's experiments, the metals may be ranged in the following order, as regards the direction of the current produced by heating a junction of any two of them: *Bismuth, platinum, lead, tin, copper, silver, zinc, iron, antimony;* that is to say, if a junction of any two of these metals be heated, the direction of the current at the junction in question will be from that which stands first in the list to the other. His experiments have also established the important fact that the current obtained by heating all the junctions B, C, D, E, F, of a chain of dissimilar metals (Fig. 3) to the one common temperature, is the same as that obtained by uniting the two extreme bars A B, F G, directly to each other, and heating their junction to the same temperature. The more accurate statement is, that the *electro-motive force* is the same in the two cases. The *current* will be sensibly the same if the resistance in B, C, D, E, F, is insignificant in comparison with the rest of the circuit. In order that there may be a current, the circuit of course must be completed, and not left open as in Fig. 3. In the case of an open circuit, the result of the heating will simply be to produce difference of potential between the extremities A, G. This difference of potential is the measure of the electro-motive force, and will accordingly be the same in the two cases.

By employing a chain composed of wires of different metals soldered together, with its two extremities connected with a galvanometer, and heating one junction to 20° C., while the rest were kept at 0° C., Becquerel obtained currents proportional to the following numbers:

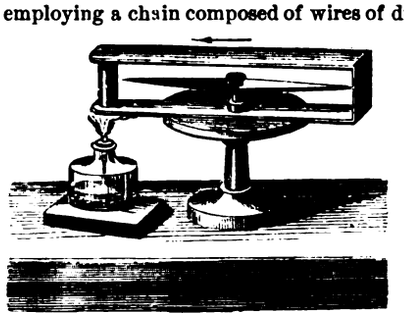

Fig. 1.

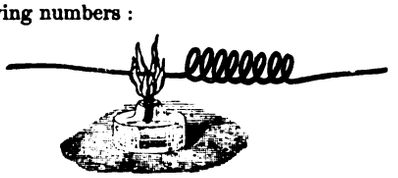

Fig. 2.

Junction heated.	*Current.*	*Junction heated.*	*Current.*
Iron—Silver	26·26	Copper—platinum	8·55
Iron—copper	27·96	Copper—tin	3·50
Iron—tin	31·24	Silver—copper	2·00
Iron—platinum	36·07	Zinc—copper	1·00

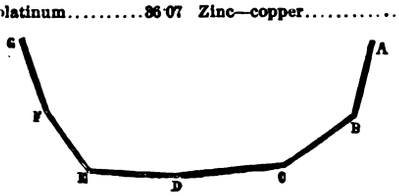

Fig. 3.

On comparing these numbers, it will be found that they are in approximate agreement with the law above stated. Thus the electro-motive force of a silver-platinum circuit comes out 10·55 by adding 2·00 to 8·55, and 9·87 by subtracting 26·20 from 36·07. The electro-motive force of copper-platinum is 8·55 as observed directly, and 8·11 as computed by taking the difference of iron-copper and iron-platinum. The deviation from precise agreement is not more than may fairly be ascribed to errors of observation.

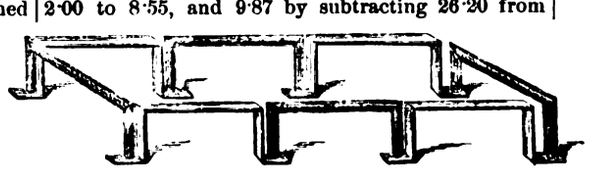

Fig. 4.

When the junctions in a thermo-electric circuit are at only two temperatures, the lower of which remains constant while the other varies, the current will be sensibly proportional to the difference of temperature only as long as this difference is small. As the difference goes on increasing, the current increases less rapidly, then decreases, and at still greater differences of temperature is reversed.

If a thermo-electric chain be composed of two metals occurring alternately (as in Fig. 4), no effect will be obtained by equally heating *two consecutive* junctions; for the current which would be generated by heating the one is in the opposite direction to that due to the heating of the other. If we number the junctions in order, we shall obtain a current in one direction by heating any junction which bears an odd number, and in the opposite direction by heating any one that bears an even number. The thermo-electric pile, or *thermo-pile*, is an arrangement of this kind, in which all the odd junctions are presented together at one end, and all the even junctions at the other, the two metals composing the pile being antimony and bismuth. The electro-motive force obtained with a given difference of temperature between the ends of the pile is proportional to the number of junctions, except in so far as accidental differences may exist between different junctions.

Thermo-electric currents may be employed either in testing equality of temperatures, or in comparing small differences of temperature. As an example of the former application, suppose a circuit to be formed of two long wires, one of iron and the other of copper, connected at both ends, and covered with gutta-percha, or some other insulator, except at the two junctions. Let one junction be lowered to the bottom of a boring, or any other inaccessible place whose temperature we wish to ascertain, and let the other junction be immersed in a vessel of water containing a thermometer. If one of the wires be carried round a galvanometer, the direction in which the needle is deflected will indicate whether the upper or lower junction is the warmer, and if we alter the temperature of the water in the vessel till the deflection is reduced to zero, we know that the two junctions are at the same temperature, which we can read off by the thermometer immersed in the water.

ELECTRICAL FIRE ARMS.

Professor Samuel Gardiner, Jr., the man who lights the Capitol at Washington by electricity, has invented a method of discharging fire arms which dispenses with gun locks and all that sort of machinery. Within the handle of the pistol or gun he has a galvanic battery, or a Leyden bottle and a rubber to produce electricity. Thence a wire extends to the cartridge, the arrangement being such that on pressing a pin with the finger, a spark of electricity enters the cartridge and fires the powder. Now, if the Professor will only make one more improvement, namely, shoot the ball by electricity without gun or powder, he will distance all competition, and add new laurels to his already distinguished fame as an electrician.

ON THE CONDENSED EFFLUVE OF THE INDUCTION DISCHARGE.

By M. Th. Du Moncel.

The attention of chemists having lately been attracted to the effects produced by the condensed effluve of the induction discharge, I have thought it might be useful to communicate some facts connected with this physical phenomenon; the more so, that some persons seem to confound the effects in question with those from the spark itself.

The electrical phenomenon to which I have given the above name is a sort of luminous discharge produced between two plates of glass, when these plates constitute together the insulating part of a condenser, the armatures of which are connected with the poles of a Rhumkorff apparatus. Thus, let one plate of window glass be separated from another by an interval of two or three millimetres; apply to their exteriors sheets of tin, or layers of liquid connected with the poles of the induced current, and you will obtain between the two insulating surfaces the electric effluve, which appears in the dark like a luminous rain, of bluish color, and gives off ozone.

To obtain the phenomenon distinctly, the layer of air should be thoroughly dry; otherwise, the discharge, instead of furnishing a homogenous effluve, is concentrated in a small number of sparks of violet color, which have not the properties of the effluve, properly so called; one of the most important of these being, that the discharge is finely divided over a large surface, and does not produce a heating effect nor sudden mechanical and disaggregating action. In virtue of this property, one may electrize a gaseous body throughout its entire mass, avoiding the complex reactions which arise from the calorific and mechanical effects of the spark. And as the discharge takes place between two unattackable surfaces, we may obtain electro-chemical reaction without oxidations or volatilizations, or accidental absorptions capable of altering the nature of the products. By employing liquid layers as armatures, it is even possible (as M. Thenard has done) to follow by sight the effects successively produced.

At the time that I first made known to physicists this curious property of the induction discharge, of traversing glass without breaking it or illuminating the interior, some surprise may have been excited at such an electrical manifestation. But now that the numerous researches in England on the electric condensation produced in submarine cables have cleared up the question of electrical transmission through various bodies, there is no longer cause for this surprise. The phenomenon is explained by conceiving that, under the influence of condensation, the molecules of the insulating body become polarised after the manner of liquid molecules in electrolysis; so that they all conduce, individually and separately, to conducting the discharge from one surface to another of the glass plates. This is what the English have called *electrification*, and it is complicated by a momentary absorption of part of the charge; this absorption varying with the electrostatic capacity of the insulator. This subject is already well known, and I will only say here that it results from the mode of electrical transmission, and the insulating nature of the surfaces thus electrized, that the electrical charges not being capable of displacement from one point to another to take at the moment of discharge the path of least resistance, as in the case of metallic surfaces, the discharge cannot be concentrated in lines of air, but is forced to continue divided, except in the case in which the air-layer between the insulating surfaces is humid, when, these surfaces becoming conductive, the experiment is similarly conditioned to that of a discharge between two metallic surfaces.

The condensed effluve of induction may, in certain circumstances, present the curious aspect of stratified light (so well marked when the induction spark passes *in vacuo*). To obtain this, one of the plates should be slightly inclined upon the other, forming an acute angle. If one of the armatures is formed by a water-layer, kept in position by a border of mastic, the stratifications may be distinctly perceived; and they are made to disappear when the plates are restored to the parallel position. These stratifications are also observed when the space occupied by the effluve is broad and free of air.

The intensity of the electric effluve depends on the relative dimensions of the armatures and their polarity. It is a maximum when the smaller of the two armatures is positive. There is then seen about this armature a beautiful luminous radiation, and if the armature is cut so as to represent a silhouette, it stands out as a Chinese shadow on a luminous ground.

I will not dwell on the physical effects of the effluve, as these have been described at length in my notice on the Rhumkorff apparatus; but will simply point out that from an electro-chemical point of view, it may result from the difference of temperature between the effluve and the spark, that under certain conditions the one will act in the opposite direction to the other. Thus, from M. Jean's experiments, it seems demonstrated that ozone is only produced easily in atmospheric air at a low temperature, while at a high temperature the electrization of the air causes the combination of its two constituent elements, a fact put beyond doubt by the experiments of M. Ed. Becquerel. It results, that according as we cause the effluve or the spark to act on an enclosed layer of air, we obtain ozone or hyponitric acid; and, in certain conditions, this difference of action may produce a combination or a decomposition. In the case of the spark traversing enclosed air, as in M. Becquerel's experiment, a combination is obtained; but, on making the effluve react upon carbonic acid, as M. Jean did, this acid is decomposed into ozonized oxygen and carbonic oxide. In other cases the effects produced might be inverse, especially where the presence of ozone is necessary to determine a combination, as in a remarkable experiment by M. Thenard.

The foregoing facts prove clearly, then, that the mode of electrization by the effluve is not at all the same as that produced by the spark.

The electric effluve has formed the subject of several important works, by MM. Grove, Thenard, Houzeau, Jean, Boillot, &c. I will here give some details (because they appear to have been forgotten) of certain curious experiments made by Mr. Grove, who, in 1856, succeeded in producing instantly, by means of the effluve on plates of glass, images similar to those of Moser. He placed between two glass plates, used for producing the effluve, a sheet of paper on which something was written, *Volta, e.g.;* under the influence of the effluve, the parts of the glass surface in contact with the lines of writing being impressed in a different manner from the other parts, it was sufficient on taking up the plate to breathe on its surface, in order to render visible an image of the writing; and by exposing to the vapors of hydrofluoric acid, an engraving on the glass was obtained.

For employing the effluve in electro-chemical experiments, two methods have been adopted. One consists in cementing together the two plates by their edges, allowing two tubulures for the entrance and exit of the gas; the other, in making the condenser with three tubes introduced one within the other, and so arranged that two of them enclose an annular liquid armature, surrounding at a distance of two or three millimetres the third tube, which contains the second armature. The former sytem has been employed by M. Jean, in his researches on ozone and carbonic acid; the latter, designed by M. Thenard, is the more perfect and practicable. The use of armatures of colorless liquid, besides affording facilities in watching the progress of the phenomenon, obviates the disruptive discharge which always occur with solid armatures at their contact with the glass, and which hinder the regularity of production of the effluve. These discharges are distinguished in the form of luminous lines, when one looks in the direction of the edge of the glass plates in this kind of condenser. In M. Boillot's apparatus, the armatures are of pulverized carbon, but I question if this acts so well as the liquid armatures.

HEAT AND ELECTRICITY.

The scientific papers contain lengthy articles on the property of highly heated metals discharging electricity; and many are trying to deduce from this a theory of a newly discovered relation of heat and electricity. With all respect to such eminent savants as M. F. Guthrie, who has laid the account of many interesting experiments before the Royal Society in London, we fail to see anything in them which is not only in direct keeping with the long since known and established laws of electricity, but a necessary result of the same. We believe therefore that any new theory is totally uncalled for. It is well known that cold air is an isolator. All our knowledge of electricity is due to this simple fact, because if air was a conductor all possible electric charges would constantly be lost and escape observation. Rarified air, however, whether it be rarified by diminished pressure or by the expansion due to heat, becomes a conductor, as proved by the well-known experiments in vacuo, Geisler's tubes, etc. The layer of air surrounding a heated body is of course in a condition of expansion by heat; it is thus a good conductor and becomes charged with the same electricity as the heated body. It is then repulsed, and makes place for other air; but to this is added the important fact that this rarified air is lighter, will ascend, and a rapid upward current of rarified air, charged with electricity, is generated; fresh air from below continually takes its place, is heated, expanded, charged, is repelled, ascends in its turn, and so a powerful charge may be dissipated in a very few seconds. That flames have a very great power of discharging electricity is a fact well known long since, and due to the same cause, working here still more energetically. The peculiarity that at a certain temperature below the red heat a heated body has the capacity to discharge negative electricity in preference, and retain traces of positive electricity, is also in accordance with the acknowledged fact that our atmosphere is naturally and ordinarily in a positively charged condition, and the earth's surface negative. Of course a negatively charged body will be easily neutralized in a positive atmosphere, which, having itself such electricity, will tend to preserve the charge in a positively charged body. When the body is very hot, however, the air currents are so strong that this preserving action of the air is overpowered, and both kinds of electricity are equally discharged. The details of the experiments all confirm the above explanation; for instance, it is stated that a white-hot platinum wire will exercise much greater discharging power than a large mass of iron at 212° Fahr. This is as it should be. A white-hot platinum wire induces much greater expansion, stronger currents of air, and heavier electric charges of the ascending air than a moderately heated large body.—*Manufacturer and Builder.*

NEW RESEARCHES IN MAGNETISM.

The *Revue Industrielle* contains a communication of considerable importance, recently made to the French Academy of Science by M. Jamin, relating to new researches into the properties of magnets:

Since the development of physics, steel magnets have been frequently employed, and many have studied carefully their qualities and attempted to discover the best mode for their construction. Up to the present, however, all that has been determined has been without system, and all the processes of fabrication practiced have been at best empirical. In brief, no one could point to any strict theory connecting the phenomena or affording a means of ante-calculating the effects of a magnet. It is this theory which M. Jamin has found, and of which he publishes the fundamental principles. Its development, it is safe to add, will not be difficult, for the researches which remain to be accomplished are all indicated and present no serious obstacles.

The following is the course pursued: M. Jamin first sought for the distribution of magnetism in a magnet formed of a single plate, and perceived that it could be represented by a curve of two branches comprised between the line of the poles and two perpendiculars to this line, one above the north pole, for example, and the other below the south pole. A second leaf being added to the magnet, the curve became less concave, and with a third plate a similar and increased effect was produced. Finally, with a certain number of plates, the curve resolved itself into a right line. Thus formed, the magnet is termed by M. Jamin *aimant normal* (normal magnet), and it is easy to see that such a magnet should present especial facilities for study. The quantity of magnetism is measured by the surface of the two rectangular triangles, which the figure forms; the poles of the magnet are at the height of the centers of gravity of the two triangles, etc.

But this "normal magnet" has a very important property which the above does not necessarily indicate. It is "*maximum*," that is to say, if new plates also well magnetized be added to the first, no further augmentation of magnetic intensity will be found; a fact explained by the consideration, already indicated by Coulomb, that each plate acts contrary to its neighbors. When we say that the magnet is thus maximum, it must not be concluded therefrom that the addition of new plates would not augment its force if the poles were provided with armatures of soft iron, which imprison the magnetism. In such case, in fact, to give to the armatures a magnetic intensity equal to that of the plates, the number of the latter must be augmented above the maximum noted. The magnet thus armed is able to carry a much greater load than when it is simply composed of plates of steel.

These fundamental points established, M. Jamin has since studied the influence of the breadth of the plates and that of their length, one of which acts on the quantity of magnetism, the other on its intensity. He has finally determined that a magnet of given thickness, composed of several plates, has more intensity than one formed of a single plate of equal thickness, and he has therefore been led to construct magnets of plates of steel made very thin.

We cannot, in the absence of further and fuller investigations, enter into the subject at present in greater detail; but the reader will understand how greatly the improvement of magnets, which will result from this beautiful theoretic study, will lead to better facilities in the construction of the magneto-electric machines which, under so many different forms, are to-day employed in industrial pursuits.

ON ENERGY.

By Professor Robert Stawell Ball, A. M., L.L.D.

The science of energy, which has been developed within the last twenty-five years, appears to have a grand future, as intimately connected with astronomy, mechanics, light, magnetism, electricity, even with life itself. It leads us back through periods, compared with which geological time is nothing, and looking forward, like a time-telescope, points out the ultimate destiny of the universe.

Energy is the capacity for raising weights. The distinction between force and energy is that: Energy is the product of a force and a distance. The unit of energy is the energy required to overcome the unit of force through the unit of distance. Energy can be stored in a rapidly moving fly-wheel, as can be demonstrated by experiment. Energy is also stored in any body moving rapidly, as, for example, a cannon ball. Energy of this kind is termed "kinetic energy." A steam engine is a means of turning into mechanical work a portion of the energy contained in the coal consumed in the furnace. Heat may be turned into mechanical work in other ways; for example, a thermo-electric battery. The energy stored up in coal, gunpowder, or a compressed spring, is denominated "potential energy." Food and fuel are both forms of potential energy; but the former has to replace the wear and tear of the machine which consumes it, which the latter has not.

Energy can be changed from one form into another. The potential energy of the body may be converted into mechanical work by raising a weight; into kinetic energy, by setting a wheel in motion; into heat, by friction; into electricity, heat and light, by Wild's electrical machine.

A piece of zinc may be burned in a stream of oxygen. The potential energy becomes light and heat; but it might have been more slowly burned in a battery; it would thus develop electricity, which might be turned into kinetic energy by an electro-magnetic engine, or into light, sound and heat, by a Ruhmkorff's coil.

Energy is indestructable. If it disappears in one form, it is only to reappear again. A hammered nail on an anvil becomes hot; the energy which moves the hammer is transformed into heat in the nail; it is not lost. Friction appears to consume energy, but this is not so, for if proper appliances are used sufficient heat can be collected to boil ether or even water. Savart's apparatus is another instance; the kinetic energy of a rotating toothed wheel being by it transformed into sound.

Perpetual motion is impossible, because some energy is always uselessly expended in friction in every machine, and energy cannot be created. No water-wheel could pump up sufficient water to supply itself.

It has been (fallaciously) proposed to work a magneto-electric machine by a steam engine; to decompose water with the electricity, and sustain the action of the steam engine by the heat developed by burning the oxygen and hydrogen produced by the decomposition. It would be impossible for the steam engine to decompose enough water for the purpose.

Since, therefore, energy cannot be destroyed, and cannot be created, the quantity of energy in the universe must remain constant. This is the principle of the conservation of energy.

All the different forms of energy in the earth, whether derived from food, fuel, wind, or water, can be traced to the heat radiated from the sun. The heat is sustained in the sun by the transformation of potential energy into heat due to the sun's contraction. If the diameter of the sun diminished 1-10,000th part, heat sufficient to supply the present loss by radiation for 2,000 years would be produced.

The heat of the stars represents a prodigious quantity of energy. The earth has a store of potential energy due to its distance from the sun; this energy is equivalent to as much heat as would be produced by the combustion of 6,000 globes of coal, each as large as the earth. Beyond this, it has an amount of energy due to its velocity in its orbit, equal to that which would be produced by the combustion of fourteen globes of coal of its own size. To this must be added a quantity of energy due to its rotation on its axis.

A period of rest, however, must at length come. The planets, since they are not rigid bodies, must ultimately fall into the sun. Heat diffuses itself, but heat cannot be turned into mechanical energy, except when transferred from a hot body to a cold body. When, therefore, by the diffusion of heat, the temperature is uniform throughout the universe, mechanical work must cease.

GRAMME'S ELECTRIC LIGHT.

Gramme's electric light is produced by the application of rotary magnetism, and the comstruction of the machine is briefly this: A ring of soft iron encircled with an endless coil of copper wire is rotated between the two poles of a strong magnet; that half of the ring which is in proximity with the north end of the magnet takes south polarity; whilst the opposite half, near to the south end, takes north polarity; the two neutral points of the system being equi-distant on each side. When the iron ring with its wire convolutions is rotated, the polarity of the ring remains unchanged in position in regard to the operator, so that the action is equivalent to the coils alone being rotated over a stationary ring-shaped magnet. The effect of this is to produce currents in the two halves of the ring, in opposite directions, between its two neutral points. At these points, however, contacts are placed which touch in succession a series of studs in connection, at regular intervals, with the wire coil, so that the opposite currents in the two halves of the ring, instead of neutralizing each other, join together and form a single current. The light is concentrated by a huge lens, made by Messrs. Chance, of Birmingham. M. Gramme has received a prize of 50,000 francs from the Committee of Industry of the French Academy, and his machine is being rapidly introduced in France. A motive power of 2½ horses produces an illumination equal to eight thousand candles.

Solar Heat as a Tool.—During the recent building of a bridge in Holland one of the traverses, 465 feet long, was misplaced on the supports. It was an inch out of line, and the problem was how to move it. Experiment proved that the ironwork expanded a small fraction of an inch for every degree of heat it received It was noticed that the night and day temperature differed by about 25 degrees, and it was thought this might be made to move the bridge. In the morning the end out of place was bolted down securely, and the other end left free. In the heat of the sun the iron expanded, and towards night the free end was bolted down, and the opposite end was loosened. The contraction then dragged the whole thing the other way. For two days this experiment was repeated, till the desired place was reached. We find no record that the heat of the sun has ever been employed in this way before, but the contraction and expansion of iron bars by fire-heat has already been used to move heavy weights over short distances. Broken walls and strained roofs and arches have been brought into place by simply heating iron rods till they expanded, then taking up the slack by screws and nuts, and allowing contraction by cold to pull the wall or roof into place.

CORRESPONDENCE.

SAVANNAH, GA., May 21st, 1873.

To the Editor of the Journal of the Telegraph:

Without entering into a review of the comparative merits of the different alphabets in use in various parts of the world, as regards their respective claims of speed and safety, there are a few points quite worthy of serious consideration before any changes are made in the Morse arrangement of the characters, viz.: Will the number of errors resulting from the use of the Morse alphabet, taken in proportion with the number of operators, messages, and length of circuits, demonstrate an inferiority to the Continental or other system?

Has investigation adduced the fact that the operators of the Continental system have achieved a nearer perfection of safety and rapidity than Morse operators of equal experience and ability?

Has careful experimenting demonstrated that the dots, spaces and dashes of the Morse alphabet are more subject to atmospheric effects than the dots and dashes of the Continental alphabet?

Does it not appear that it would be as reasonable to propose a change in the English language because of the extent of the grammatical errors daily and hourly exhibited in its spoken and written use by uneducated people, as to assume the necessity of an *improved* alphabet because unskilled manipulators and uncultivated auriculars *remorselessly* disfigure its symmetrical proportions and disturb its harmonious flow?

The remedy for errors is not in the change of an alphabet, which is in use upon the longest and finest telegraphic circuits in the world, and practised by the most skillful operators, but rests with the proper selections of operators by regular competitive examination, with positions according to ability, and prospects of advancement proportionate with improvement. Nature has an extremely interesting order of progression which telegraph corporations might follow with advantage to all concerned. There is considerable telegraphic animalculæ quite out of its element, and some mastodons confined in too small pastures.

F. P. B.

BERWICK, Pa., May 23, 1873.

To the Editor of the Journal of the Telegraph:

We notice with regret, the proposed wholesale change in the Morse alphabet, and beg leave to speak a word in favor of part, if not of all of it. The principle, and, in fact, only objection to our old stand-by, is the spaced letters, and consequent liability to error on this score. Admitting that these are faulty, why, in the name of common sense, should the innocent suffer for the guilty. Why should we condemn twenty-one good letters, in whom there is no guile, because six of their associates happen to be shaky; why not court-martial the six, and substitute something better, if they be found guilty. It seems to us it would be about as reasonable to discharge the whole force of operators, because the company happens to have on that force a number who rejoice in the title of the undersigned. The objection to the spaced letters is, that the liability to err is so great in receiving or transmitting them. We grant that there are a great many errors in this way, but then, so are errors made in the other letters, and so there would be in any alphabet that could be adopted, as long as operators are careless or very excitable, as you *occasionally* find one at present. However, as there is no use in growling at anything, unless one has something to offer as a substitute—good or bad—we would propose something as follows to replace the defective letters. The letters to be expunged are C. O. R. Y. Z., &c. Could not a selection be made to replace them. We don't profess to know much about this matter, but that some arrangement like this would be preferable to wholesale slaughter, is the earnest opinion of

TWO PLUGS.

BURLINGTON, Iowa, May 11th, 1873.

To the Editor of the Journal of the Telegraph:

Your issue of May 1st contains a communication from Winthrop, Me., signed "Winthrop," relating to the change of instruments in Scotland in 1857, in which the writer asserts that at the expiration of the specified period allowed by Mr. Culley "only one man was disqualified, and he is now train despatcher on the C. B. & Q. R.R. and a first-class Morse operator." I never liked flattery, so I disclaim all title to the complimentary portion of this sentence; but, as I believe myself to be the imaginary "disqualified" individual referred to, please allow me to make a few remarks on the subject. As stated by Mr. C. F. Varley in his article written in December, 1867, every operator was furnished with an explanatory copy of the new alphabet and signals; *two months* were allowed for its study, and a day named for the change. The two months expired, the day arrived, but many were not ready for the change. *Another month* was granted with a similar result. Pressure was then applied to the pocket, in the form of a promised reduction of the salaries of those who at the expiration of the third named period should be found unable to make the change, and when the day arrived *every one* was found prepared—that is, we were all "plugs," or beginners. This is the first I have heard of Mr. Culley's "fortnight orders." Probably the story is a little joke of Winthrop's, but its lack of foundation deprives it of any point it might have possessed.

I confess that I liked the change of instruments then just as little as I like the proposed adoption of the European Alphabet in this country now—changing is not my *forte*.

I used the Bain Alphabet in Scotland for over eight years, and have worked Morse since 1865.

> "I've paced much this weary mortal round,
> And sage experience bids me this declare,"

that I consider the Bain Alphabet the more accurate, but slower and more clumsy than the Morse. The latter is decidedly the fastest alphabet. I prefer Morse, with its spaces and varying dashes, to the heavy dragging letters and numerals of the Bain. The spaced letters are objectionable, but it will be difficult to substitute anything better. Incompetent and careless operators cause more mistakes than the spaced letters ever will.

EXPERIENTIA DOCIT.

ROSE HILL, April 21, 1873.

To the Editor of the Journal of the Telegraph:

I wish to say a word or two in regard to the alphabet. I dislike the European because its chief difference to ours is—it drops the spaces and inserts letters and figures already in use, so as to confuse and confound; one would have a double study in rooting out old and planting the new characters in his mind. Why not (as a former writer proposes) "force every operator to write Morse," or let our figures remain as they are (for I see nothing objectionable in them); drop our spaces and insert dots and dashes. F .—., J .———, &c., &c., seem good enough. For example, drop .. . for *c*, and use .·—— — or something of the kind. What is the use of forcing us to learn an entire new alphabet, or one that uses J for C, 1 for P &c., &c. I can see no sense in such a change, but will welcome one which simply condemns the *defects* in our present method, inserting dots and dashes where are now spaces.

COYOTE'S OWN BOOK.

YORK, York Co., ME., May 26, 1873.

To the Editor of the Journal of the Telegraph:

Now that we have had a word with regard to the change of the alphabet, from a variety of sources, allow one more "plug" to be put in a word of opinion, and also offer a suggestion.

I do not know the originator of the contemplated change, but I think it must have originated with some person who has a natural propensity to try experiments without looking at the expense or results even.

I would favor any move that might tend to the good of any enterprise, but utterly fail to see what good can *ever* come of a change from the old "Morse," with which every operator in America is fully conversant.

The Morse has been in existence for twenty-nine years, and probably no good operator has ever had just occasion to complain.

It seems to me to be as equally consistent for certain people to try to introduce a newly arranged form for writing, just because Mr. A. does know how to make some particular letter, (not one in twenty who can write, can make a respectable looking *æ*), or because Mr. B. can't read a letter unless it is written very plain

I am free to confess it is hard sometimes, but the man *who can* readily read "a lawyer's letter," does not complain. It is the poor reader who complains; but is the style of writing to be changed, forsooth!

So with those who read and write the telegraphic language; the fault is in the operator. No blame can be attached to the alphabet for errors committed by a blundering operator.

Let operators come up to the standard, and no fault will be found with the system which is now so perfect that it cannot be improved by adopting any foreign dots and dashes.

G. F. PLAISTED.

BRIGHTON STATION, May 25, 1873.

To the Editor of the Journal of the Telegraph:

I have but little to say about the contemplated change in the Morse system of telegraphing. What I have to say is in direct opposition to any change whatever. We are doing, and have done as well with the system we are now using as we can do with any other.

There will be as many mistakes made with any other system as with the Morse. What good will result from any change? I can see none. We will have "plugs" (and therefore "bull" messages, with any system, and it is obvious, that by introducing a new system, the only improvement will be in the quantity of "plugs." We have some first-class operators now, but introduce a new system, and there will not be a first class operator in the country for six months.

It is claimed by some that if other characters were substituted for those now in use, representing the spaced letters, and the letter L, mistakes would be less frequent. I think this is incorrect. A majority of the mistakes that are made arise from neglecting to space between letters. No operator will deny that this is the case; if he does, all I ask is for him to notice how many operators with whom he is in daily communication space between letters as they should? This fault would be as common with any other system as with the Morse.

Let us leave the Morse system as it is, and use no other; we can have no better; if we could, a change would be necessary. Let us do nothing that will subject us to the charge of lacking in respect for the father of the telegraph, and the originator of the telegraph system as practiced in our great country.

A. G. LIVINGSTONE.

Digitized by Google

CINCINNATI, May 23, 1873.

To the Editor of the Journal of the Telegraph:

I have had an idea of giving you my opinion in regard to the proposed change in the alphabet, but an exceeding press of other matters has prevented. It seems to me the objection raised by Supt. O. H. Booth, in regard to the additional time that would be required in R. R. business, where quantities of figures are used, is *vitil*. I have one suggestion to make, however, that seems to me tangible, and one that will cause no serious delay to business or confusion, viz.: simply abolish the Morse character "&" (. ...). This will obviate the "Gill & Pie' bull (which, by the way, recently turned up here again), and many others of similar character.

It is my opinion that when it is fully understood that ". ..." means "E S," and nothing else, that many provoking errors will be prevented. Let us have an expression on this point.

GEO. T. WILLIAMS.

To the Editor of the Journal of the Telegraph:

I desire to enter my protest against the adoption in this country of the European Alphabet, and will briefly state my reasons for opposing it.

In the first place it would inevitably create much confusion, as it would make blundering students of as all. It would be as difficult for operators to learn that — · — · meant C, and · — · R, as it would be for a person, who had all his life been accustomed to the English language, to learn that "yes" meant "no," and *vice versa*. To be sure we could become aware of the fact in a few minutes, but it would require months of practice before it would come natural to us, and until it did "come natural," we could not possibly be good receivers.

Doubtless, most operators remember the time when, while copying one word they would miss the next; and, I think, all will agree with me when I say that no operator can be a good receiver until every character conveys its meaning to the brain, without the slightest effort of thought. Time alone can suffice for this; and if a new alphabet were adopted, it would be months before the best and quickest of us could become reasonably good receivers.

In the meantime, business delayed indefinitely, and mistakes innumerable would be the order of the day, resulting in endless complaints and perhaps expensive lawsuits.

Secondly, I oppose it because it is in itself objectionable.

Few of the combinations are good, some of them are almost absurd. Think of · — — — — for the figure one, · · — — — for two, — — — · · for eight, — — — — · for nine, and, oh, climax of horrors! — — — — — for naught. What would be the effect of a hundred thousand, or a million, made with these numerals?

It is claimed that this alphabet is the result of profound thought, and that it is founded on scientific principles. Those who favor its adoption would have us believe that it is the *ne plus ultra* of telegraph alphabets; that in it is embodied the combined wisdom of many superior intellects, and indeed it is heavy enough to represent the momentum of all the brains in Europe.

But, permit me to modestly assert that, if a few of our smart American telegraphers would "put their heads together," they could produce something infinitely better and more worthy the skill of American operators. Imagine some of our experts diligently pegging away at those clumsy combinations. Spirit of Morse, defend us!

The European Alphabet, no doubt does very well for Europe, inasmuch as it combines some of the chief characteristics of the leading nations there. Being stupid enough for an Englishman, heavy enough for a German, mixed enough for a Frenchman, and heathenish enough for a Chinee; but I appeal to the fraternity on this side the water, if there is anything American it?

Our Morse Alphabet is good enough. I do not see that it can be improved, except, perhaps, in the matter of the spaced letters. If it be deemed advisable, let those alone be changed, and the others remain as they are. Taken all through, I think they will compare favorably with any that can be invented. But, if we must have a new alphabet entire, let it be an improved one, which the European certainly is not. H———.

To the Editor of the Journal of the Telegraph:

The proposed change of alphabet, from Morse to the International, is hardly a matter of sufficient importance to operators to justify so much opposition as has been shown lately on their part; but old workmen are sometimes fond of old tools, and even refuse to give them up for newer and better ones. So far as operators personally are concerned, they should not care whether the change is made or not; for if business is not transacted as satisfactorily to the public under the new system as before, the responsibility rests with those who inaugurated the change, not with the operators. There can be no question but that the present Morse alphabet is more rapid than the International, when both "sender" and "receiver" are skillful operators; but it must not be forgotten that the really skillful ones are in a very small minority, while the large majority are the ones that would be most benefitted by the change. One or two of your correspondents state that there would be no trouble if operators would only send "Morse." Very true, and that is just where the trouble is. Very few do send good "Morse," and still fewer send spaced letters correctly, nor can much improvement be expected under the present system. The majority of operators are poor senders, just as the majority of persons in other occupations are poor penmen, while the few only are skillful and correct. These would find no trouble with any alphabet, but for the majority of operators any fundamental change tending to make the art easier to practice would be a lasting benefit, and greatly reduce the number of errors. There are many operators who are good receivers, but poor senders. With them practice fails to effect any improvement; on account of nervousness, or for some other cause, they are unable to control the muscles of the hand sufficiently to write in a plain, legible manner. The spaced letters are an especial affliction to them. Errors, of course, are not always caused by the use of spaced letters, but it is perhaps safe to say that the majority of them, and the most fatal ones, are. This is of course excepting bad penmanship, which is probably the most fruitful of all sources of errors.

To effect the change, the coöperation of the railroad companies would be necessary, in order to benefit that class of operators that most needs it. Otherwise operators at relay stations would be obliged to be familiar with both alphabets. J. J.

CLINTON, N. Y., June 6, 1873.

To the Editor of the Journal of the Telegraph:

Please explain through the JOURNAL the following, in regard to half-rate messages:

A "red" message, containing 16 words, is handed me for B, the full rate being only 30 and 2, 15 and 1 is, of course, one-half, and which, of course, makes the aggregate on the message only 21 cents. This being less than the minimum price adopted by the company for such a message, I decline to send it, except at full rate; others insist that I should take 25 cents and send it along as a "red," which would be manifestly incorrect, as it would not strictly be a *half-rate* message; then what is the rule of the company in this case? DOUGHTY.

Answer.—You should have charged twenty-five cents, and sent the message as a half-rate. See reply to G. W. S. in the JOURNAL of May 15, 1873.

To the Editor of the Journal of the Telegraph:

We have a short line of telegraph put up for the purpose of private communication, and wish to extend it further. We cannot make a ground wire work, and have been forced to use a wire to complete the circuit. Not wishing to do this, we ask you to enlighten us on the subject, not only for ourselves, but, perhaps, others in a like situation.

We use Daniel's Battery, and with a return wire our instruments work finely. H.

Answer.—Your ground connections must have been faulty. Put your plates two or three feet deep in the earth where the soil is always in a moist condition. That will probably overcome your difficulty.

Novice.—"Anything" and "Everything" are not to be found as words in Webster's Dictionary, which is the standard adopted by the Company. Custom, however, has incorporated them into the English language, and they always have been and are at this time each counted as one word, upon telegraph lines. It is not desirable now to question the correctness of their application.

Union 76.—The words "Secr'y, Hope Lodge No. 282," or any other affix to a signature, should be charged for if its transmission is desired.

G. X.—If the sender of a message desires anything besides his signature transmitted, it should be counted and charged for. For instance, a message signed "J. Smith, 10 Wall St.," the last three words should be charged for.

Bn.—The laying of the first Atlantic Cable was completed August 6, 1858.

C. A. G.—Executive Order No. 147, modifying Rule 94, relates to the course to be pursued by Managers and others when called upon by a Court or other legal authority, to produce messages in the Company's possession. You have evidently confounded Rules 93 and 94.

D. H. Dirr.—We cannot inform you as to the prospect for a situation upon the British lines. The cheapest rate of passage to England is about thirty dollars (gold) from New York. The amount of pleasure and benefit to be derived from such a trip cannot be estimated without experience. What might seem a pleasure and benefit to one may be exactly the reverse to another.

Waverley.—There are eight words in "Please send us two thousand dollars ($2,000)." The word dollars is not part of the figure—it is an article in the sense given to the number of two thousand.

Loda.—There are eight words in "Do not send me the flour ordered to-day."

S.—There are seven words in "Eighty cents rates twenty cents per cwt."

J. E. C.—The JOURNAL is sent regularly to every office of the Western Union Company. If you do not receive it twice a month the trouble is with the postal service. The postage is paid quarterly by the office receiving the paper.

H. McDougall.—Mr. A. Hunter, Toronto, Ont., is the agent of the Telegraphers' Insurance Association, for the whole of Canada. Apply through him.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
June 15, 1873.

To all Offices on W. U. Lines:

THE NEW RATES.

On and after July 1, 1873, the rates to squares given on the new tariff sheet will go into effect. The sheet now in use should be carefully taken from the tariff book and the new one substituted. Preserve the old sheet for future reference.

In making the change, managers should see that the number of the sheet corresponds to the number of the square in which their office is located; if it does not correspond the fact should be reported immediately to the Superintendent.

Offices of the Central and Southern Divisions, and all in the Eastern Division, except those east of Maine, will charge the following local rates, on and after July 1st:

25 cents for 25 miles or less.

30 cents for over 25 but not over 50 miles.

The local rate for 75 miles will be discontinued.

The changes in the local and square rates will increase the local rate of 35 cents, and the first square rate of 35 cents at offices in and east of New York State. No other rate should be increased by the adoption of the new rate.

Offices which are not supplied with a new tariff sheet before July 1st should make the necessary application to their Superintendent.

The following changes in the squares of offices named have been made, and will take effect July 1st, 1873:

Lewes, Del., square 60.

Cairo and Mound City, Pulaski Co., Ill., square 329.

Newton, Ks., square 518.

Peabody, Ks., square 514.

Greenport, Mattituck, Riverhead, Sag Harbor, Shelter Island and East Hampton, L. I., N. Y., square 33.

Cochecton, N. Y., Callicoon, Basket, Hankins, Lordville, Narrowsburg and Stockport, Delaware Co., N. Y., Square 58.

Hawley, Honesdale, Lackawaxen, Middaughs, Millville, Milford, Montrose, Montrose Station, Nicholson, New Milford, Pine Grove, Pike Co., Shohola and Susquehanna, Pa., square 58.

Fortress Monroe, Va., square 69.

Huntington, W. Va., square 182

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Brocks Gap, Ala., closed.

Pequot House, Conn., is re-opened as a W. U. office; tariff same as New London, Conn.

Youngstown, Ill., closed.

Rising Sun, Ind., re-opened. "Tariff for Other Lines," 45 and 3 from Aurora, Ind.

Beattie, Ks., re-opened; square 502.

So. Hanson, Mass., closed.

Dentonville, Mich., closed.

Sand Point, Mich., closed.

The following summer offices in New Hampshire will be re-opened for business July 1st:

Crawford House, N. H., re-opened.
Bethlehem, " "
Glen House, " "
Gorham, " "
Mt. Washington, " "
Mt. Washington Depot, N. H., re-opened.
Profile House, " "
Twin Mountain House, " "
Waumbeck House, Jefferson, N. H., re-opened.

Business for Mt. Washington Depot, N. H., should be checked to Crawford House, N. H., and Mount Washington, N. H., to Glen House, N. H.

The tariff to or from the above "Summer Offices" in N. H., "except Gorham," is 20 cents more than rate by "square." Tariff to Gorham, from offices in Vt. and N. H., will be 20 cents more than square rate; from all other offices, tariff will be 25 and 1 "for other lines" from Portland, Me.; check Portland.

The P. O. A. of Grant, N. Y., is Brakenstraw, Chautauqua Co.

Lebanon Springs, N. Y., re-opened.

Overlook Mountain House and Woodstock, N. Y., re-opened. "Tariff for Other Lines," 30 and 2 from Rondout, N. Y.

Trenton Falls, N. Y., re-opened.

Havana and Watkins, N. Y., are now W. U. offices, square 83; check direct.

Boon Hill, N. C., changed to Princeton.

Florence, O., closed.

Liberty, Guernsey Co., O., re-opened; square 170.

Business for Hauto, Pa., will hereafter be checked direct; square 66. The P. O. A. is Hauto, Nesquehoning P. O.

Messages may be taken for the Penna. Lunatic Hospital at Harrisburg, Pa., and the State Hospital for Insane at Danville, Pa., former to be delivered from Harrisburg, Pa., and the latter from Danville, Pa. Fifty cents for delivery should be collected in both cases.

Jacksonville, Texas, closed.

Hereafter the "Tariff for Other Lines," from Sherman, Texas, to Paris, Texas, will be 65 and 4.

Highgate Springs, Vt., re-opened.

Sewall's Point, Va, re-opened. The office will hereafter be in square 69.

Jordan Bridge, Alum Springs, Va., re-opened; square 142, The office wil. hereafter be known as Jordan Alum Springs, Va.

Hereafter the "Tariff for Other Lines," from Portland, Oregon, to Walla Walla, W. T., will be $3.00 for 10 words and $1.00 for each additional five words or less.

Berkeley Springs, W. Va., re-opened.

Old Sweet Springs, W. Va., re-opened.

NEW OFFICES.

276 Salt Creek, Ala.
* Boggs, Cal., 30 10 Colusa, Cal., ck. San Fran.
* Grand Island, Cal., 30 10 " " " "

94 Manayunk, Mifflin Co., Pa. P. O. A. is Manayunk, McVeytown P. O.
* Port Ludlow, W. T., 50 25 Seattle, W. T.; check San Francisco.

Offices having "Special Sheet A" will check Tremont, Pa., 20 cents more than "special rate" to Philadelphia. Square rates not to be increased.

Half-rate messages may be taken for, and received from, Sulphur and Honey Grove, Tex.

WILLIAM ORTON, *President.*

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
NEW YORK, June 13th, 1873.

EXECUTIVE ORDER, No. 148.

No superintendent, manager or disbursing agent of this company is authorized to obtain vouchers in advance of their actual payment; and all employees are notified not to sign receipts except upon tender of the money, unless they choose to sign at their own risk.

WILLIAM ORTON, *President.*

TRANSFER SERVICE.

EXECUTIVE OFFICE,
New York, June 14th, 1873.

Mr. FRANK JAYNES of the San Francisco Office, has been appointed Transfer Agent for the Pacific Division, and all transfers for offices in that Division will be hereafter addressed to him instead of to Mr. James Gamble, as heretofore.

WHEATLAND, Pa., in C. O. Rowe's district, has been closed as a money order office.

FOREIGN TELEGRAPHIC ITEMS

THE NEW ATLANTIC CABLE.

The Great Eastern having just completed the shipment of a new Atlantic cable and general stores, left her moorings in Sheerness Harbor on Tuesday for Portland, whence, after taking in a further supply of coal, she will proceed to Valentia to commence laying the new cable. The Great Eastern will be accompanied by the steamship Robert Lowe, having on board the shore end of the cable for Valentia, and the steamship Edinburgh, another of the Telegraph Construction and Maintenance Company's ships, with the shore end cable for Cape Breton. Another of the company's ships, the Hibernia, which left Sheerness last week in order to repair the French Atlantic Cable, has also a portion of the intermediate new cable on board, and, on the completion of the repairs of the French cable, will return to Sheerness to take in general stores and a further supply of new cable, and will then join the Great Eastern at Heart's Content. There are at present 2,453 miles of cable on board the Great Eastern. The new cable will be laid from Valentia, Ireland, to Sydney, Cape Breton. After laying the cable the big ship will proceed to Heart's Content to fill up with coal ; she will then proceed to the break in the Atlantic cable of 1865, accompanied by the steamship Hibernia, where she will stay, weather permitting, until the fault has been repaired, after which the monster ship will return to Sheerness to take on board a section of the new cable to be laid from St. Vincent to Pernambuco, a large section of this cable being already manufactured. The Great Eastern is expected to return to Sheerness about the 26th of September next. The vessel is under the command of Captain R. C. Halpin, who, together with the principal part of the staff of the ship, has been employed in laying the Atlantic, British India and China cables. The whole of the petty officers, and the greater portion of the crews of the Great Eastern, Hibernia, Edinburgh and Robert Lowe, have been in the employ of the Telegraph Construction and Maintenance Company since the laying of the first cable, in the year 1864.—*The Railway News, May* 17.

At extraordinary meetings of the British Australian, British Indian Extension, and China Telegraph Companies, recently held in London, resolutions were adopted providing for the consolidation of those companies into a new company, to be called the Eastern Extension, Australian and China Telegraph Company, and for winding up the companies named.

At the meeting on Friday, the 23d ult., of the Great Western Telegraph Company, the special resolutions passed at the extraordinary general meeting on the 8th inst., for the voluntary winding up of the Company and for the sale of its business and property, including the cables made under the contracts with Hooper's Telegraph Works, in exchange for the same number of shares in the capital of the Western and Brazilian Telegraph Company, Limited, were confirmed.

The cable news writer of the Delhi, East India, *Gazette* gives the following statement, which was received on the 22d of March from Turkestan : The Russians have erected a telegraph line in Yarkand, and are going to have one also in Khokand and Bokhara. They (the Russians) had a telegraph line in the districts where they had cantonments, but as they are marching against Urganj they are erecting lines in foreign countries.

THE AMALGAMATION OF THE ATLANTIC CABLE COMPANIES.

At the extraordinary general meeting of the Anglo-American Telegraph Company, the terms for amalgamation with the French Atlantic and Newfoundland Telegraph Companies were approved, and the Board were authorized to complete the arrangements.

At a special general meeting of the French Atlantic Cable Company the terms of amalgamation with the Anglo-American Telegraph Company were presented to the shareholders, and a resolution approving of the scheme was presented, and a poll having been demanded, resulted in its favor by a vote of 32,238 shares against 6,729 shares. A resolution that the company be wound up voluntarily was adopted, and liquidators elected. Other resolutions for carrying out the amalgamation were unanimously adopted.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ending May 10, 1873, was 329,382—an increase on corresponding week of last year of 49,223.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended May 17, was 337,038, an increase over the corresponding week of the previous year of 57,479.

The receipts of the Atlantic Telegraph companies during the first three months of the current year amounted to £190,000, against £170,000 for the corresponding period of the previous year.

THE Great Northern Telegraph Company notify that land lines from Nagasaki to Simonosaki, Hiogo, Osaki, Yokohama and Yeddo have been opened. International messages are, however, at present only accepted by the Japanese authorities at sender's risk. The Company's charge to Nagasaki remains as before —£4 6s. from London, and £4 7s. from the country —and for the other stations it is £4 17s. from London, and £4 18s. from the country. To ensure certainty of delivery, the Company will, on handing over the message to the Japanese department at Nagasaki, simultaneously forward a copy by post to the receivers.

The steamship Dacia having successfully laid the new cable for the International Ocean Telegraph Company between Cuba and the United States, has sailed for Jamaica, to pick up the lost Panama and Porto Rico cables.

BORN.

HILTON.—At Kawkawlin, Mich., May 29, 1873, to S. M. Hilton, Manager W. U. Tel. Office, a son.

HOTALING.—At Chetopa, Kansas, May 18, 1873, to Ben. S. Hotaling, Manager W. U. Tel. Office, a son.

NICHOLS.—At Semickley, Pa., June 5, 1873, to S. K. Nichols, Manager W. U. Tel. Office, a son.

OWEN.—At Brunswick, Ga., May 12, 1873, to D. G. Owen, Manager W. U. Tel. Office, a daughter.

MARRIED.

CONGDON—HOBLIT.—At the residence of the bride's parents, Atlanta, Ill., by the Rev. S. M. Crissman, W. J. Congdon, agent and operator at Mt. Pulaski, Ill., to Kate Hoblit.

GREGORY—KINSEY.—At Carnak, Ga., May 22, 1873, by Rev. W. F. Smith, W. H. Gregory, Manager W. U. Tel. Office, to Miss Mattie Kinsey.

WILSON—PATTERSON.—At Hudson, Mich., April 10, 1873, H. A. Wilson, Manager W. U. Tel. Office, to Miss Marrilla Patterson.

DIED.

LEBARON.—At Pensacola, Fla., May 23, 1873, Ettie J. Holmes, wife of Charles LeBaron, Jr.

RYAN.—On Sunday, May 25, 1873, after a short but severe illness, Malachi J. Ryan, operator W. U. Tel. Office, Pittsburgh, Pa., aged sixteen years.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,

Western Union Telegraph Company,

145 Broadway, New York.

NEW YORK, JUNE 16, 1873.

RETURN OF MR. GEORGE B. PRESCOTT FROM EUROPE.

Mr. George B. Prescott, Electrician of the Western Union Telegraph Company, of the Company's commission to Europe, arrived home on the *Scotia* on Tuesday, the 3d instant, in excellent health. Mr. Prescott has been absent between three and four months.

We hope soon to be able to publish the report of the observations of Messrs. Prescott and Eckert upon the telegraph systems of Europe, which we have no doubt will prove deeply interesting to the telegraphers of America.

ANONYMOUS COMMUNICATIONS.

Once again we desire to call the attention of correspondents to the necessity of signing communications they may send to us for publication.

We receive many notices, unsigned, of births, marriages, and deaths; items we would gladly publish as interesting to many of our readers, but which, in following the invariable rule with anonymous communications, go into the waste basket.

WILL not Managers and Receivers exercise a little care in the checking and sending of messages addressed to the officers of the Company? The names and positions of the officials are certainly well known to every employé, and it can only be from carelessness or stupidity that messages addressed to them are, as is frequently the case, checked and sent collect. To correct each error of this nature, one or more office messages are required, burdening the wires with unnecessary business, and involving extra clerical labor.

By some unaccountable error, the Service report for April, which was published in our last issue, contained, among the list of resignations, the name of JOHN L. COLLISTER, Manager of the branch office at Pier 28, North River. Mr. Collister has not resigned, nor has he any present intention of leaving the service of the Company.

EXECUTIVE ORDER No. 148, notifying employees not to sign receipts except upon the tender of the money, will be found on page 214.

HOW CAN TELEGRAPH COMPANIES PROTECT THEMSELVES AGAINST BAD MANIPULATION OF THE KEY?

A great majority of the letters which we have printed during the last few months upon the suggested change of alphabet bear evidence of the reluctance felt by operators in every section of the country to advise the change. The errors, which are of daily occurrence, and which we attributed to the use of the spaced letters, are generally acknowledged by our correspondents, but our conclusions as to their origin are denied, somewhat inconsistently it must be urged, and are placed to the account of bad manipulation. Without doubt this conclusion is correct, but it carries with it the evidence that did not the spaced letters exist, errors could not occur from their use. Many of our correspondents object to a change because the form of alphabet we are using was arranged by Professor Morse, an American, and on that account, if for no other, this form should be retained. We can see no force in this point. As well it might be urged, that because steam was first applied to navigation by an American, that steamboats should be restricted to the appliances of Fitch and Fulton. The alphabet of Morse consists of a combination of long and short signals and spaces, and, no matter in what conjunction they might be placed, there can be no detraction from the credit due to him.

If the telegraph companies accept the conclusions of their operators, as expressed in the published correspondence, a proper consideration for their own protection against loss arising from the errors occasioned by bad manipulation of the key, will force them to take advantage of the only possible way in which comparative safety can exist. This will be found in classifying operators according to their ability, and holding them to a strict responsibility for the damage arising from their lack of skill or judgment. How and by what means this classification shall be effected, is a matter for consideration. Operators who are uniformly careful, and who would bring an intelligent judgment to act upon the business under their charge, regardless of the form of alphabet used, would be benefited, but those against whom protection might be afforded by a change of alphabet, would find a lower level than that now occupied.

A judicious classification of operators is a difficult task, and one that is very ungrateful. Yet, sooner or later, under any circumstances, it will have to be practised. The man who, for many years, faithfully serves his employers, both in will and action, in common justice deserves something more at their hands than the tyro who, with flexible wrist and ready ear, is his equal in making and translating dots and dashes, but who, from inexperience, is necessarily inferior in the general knowledge of the business which renders such services so valuable.

— Mr. J. C. Sherman is manager of the telegraph department of the Great Western Railway, with head-quarters at London, Ontario.

THE NEW TARIFF OF RATES.

The circular from the Tariff Bureau, in this issue of the JOURNAL, should be carefully read and noted by managers and other employés.

It contains instructions in relation to the new and reduced rates, and directs that they are to be put into effect on and after July 1st; that they are entirely to supersede the square and local rates now in use; that a slight increase, for the sake of uniformity, is made in the local rate for distances between fifty and seventy-five miles, and first square rate in certain portions of the Eastern Division; and that, except this increase, no other will be made. All present rates, therefore, which are higher than the new rates, will be brought down.

The change will be found to be the most general and complete reduction of rates ever made by the Western Union Company.

For offices south and west of New York State the reduction of all rates, not "special" (although, probably, more than half the "special" rates are considerably reduced), for distances not over 100 miles, will be about 33 per cent. For distances between 100 and 200 miles, nearly 40 per cent. In the Eastern, for this distance, about 15 per cent. For all distances above 200 miles the reduction is from 25 to 50 per cent. In some cases it is still greater. All districts of the Western Union Company, east of Kansas and Nebraska, will have a uniform scale of rates—the value of which, in the future consideration of the subject of tariffs, can only be thoroughly appreciated by those whose duties have brought them in contact with the intricacies of the present system.

Since the inauguration of the square system, the endeavor to equalize the rates, by reduction, has been unremitting, and it is believed that the schedule which will go into effect on the 1st of July has fully attained the desired object, and that the great concessions therein made by the Western Union Company will be duly appreciated by the public.

SUNDAY WORK.

To all of the employés of the telegraph companies the subject of laboring on the Sabbath is a matter of great interest, and to many the necessities of the service, in administering to the wants of the public on that day, amounts, from what appears to us to be mistaken views of duty, to a positive violation of conscience. In the unfortunate position in which these latter seem to be placed, they are deserving of sympathy, and receive it, yet nothing can be done by the companies to mitigate their condition.

Volumes have been, and still might be, written upon what may be deemed *necessary* labor on the Sabbath day. Theologians have pondered and studied deeply, but the question is still an open one, and will be to the end of time. The true solution, probably, is, that it is a matter of individual conscientiousness, and then it is evident that the convictions of one should not be laid down as law to another in depriving him of what has come to be regarded as a necessity—the free and untrammelled use of, practi-

Digitized by Google

cally speaking, instantaneous communication whenever desired. If those of whom we are speaking could view this question in its true character, they would see that the telegraph, in its relation to mankind, is simply a machine connecting distant parties, and that in this machine their individuality is lost. Their duties are not the duties of labor, but consist in administering to the wants of others, and than this there is no pursuit more noble.

Telegraph offices must be open, and messages must be sent, on Sunday, not because a profit accrues to the company by so doing, but because the necessities of the public, and especially the issues of life and death' require it. If it is wrong to prepare food, to minister to the wants of the sick, or to bury the dead on the Sabbath day, then it may be wrong to send messages on that day relating to peril and disaster, and sickness and death. There can be no doubt that some work upon the lines and at the offices must be done on Sunday. Of the necessity of the work the public must be the judge. The telegraph, in its subservient character, has no right, and cannot assume, to establish a standard of orthodoxy for those who require its service. The presumption must be, that the motives of senders of messages are good, and as pure as those which actuate the machinery of transmission.

POSTAL CARDS.

WESTERN UNION TELEGRAPH COMPANY.
TREASURER'S OFFICE,
NEW YORK, June 15, 1873.

A large portion of the correspondence with this office can be advantageously done by the use of the new Postal Cards, in preference to telegraphing or sealed letters.

The weekly reports of gross receipts, from offices within three days of New York, should be sent by the postal cards, and also all letters of advice, inquiry and reply, which do not require any accompanying inclosure.

The attention of managers is requested to this subject, with a view of saving of postage and relief of the wires.

R. H. ROCHESTER,
Treasurer.

THE FRANKLIN TELEGRAPH COMPANY.

At the annual election of the Franklin Telegraph Company, held in Boston, June 12th, the following parties were chosen as directors for the ensuing year, viz.: John Duff, John R. Duff, Oliver Ames, J. S. Fay, T. G. Dexter, W. H. Guion, G. B. Grinnell, G. S. Bowdoin and J. W. Brown.

A MISSING TELEGRAPHER.—Isaac F. Pharo, Lineman Western Union Telegraph Company, stationed at Wilmington, Del., disappeared from that place on or about May 10th. When last seen, he was on a train of the P. W. & B. R. R. going towards Philadelphia. He was about 5 feet 9 inches high, light complexion, brown hair and moustache; wore a black felt hat, dark coat, pants and vest, of Scotch mixed goods, and had on low shoes. He has a wife and two children living in Westchester, Chester Co., Pa. Mr. Pharo has been in the employ of the Western Union Telegraph Company for six months or more, patroling the line with horse and wagon, between Philadelphia and Washington, and was very much esteemed; his absence is a great mystery.

ANOTHER TELEGRAPH DECISION.

Another decision sustaining the validity in law of the conditions contained in the printed heading of the usual telegraph blank, has just been rendered in the Common Pleas Court, at St. Clairsville, Ohio. The action was brought to recover from the Western Union Company damages for the non-delivery of an unrepeated day message, to have been sent from New York to St. Clairsville, in February, 1869, the claim being, that the plaintiffs, who were bankers, cashed certain drafts upon parties in New York, at a total loss to themselves, which loss might have been avoided had they received the non-delivered message, practically informing them the drafts were not good.

The Judge charged the jury, that the burden of proof in an action upon negligence is always upon the party who charges it, as the plaintiff in an action, and that the apparent exception to this rule in actions against carriers is inapplicable, as telegraph companies are not common carriers, and are therefore not insurers as to that which they undertake; and that a telegraph company may limit its responsibility as to unrepeated messages; and, as has been repeatedly held, that a regulation of a telegraph company that it will not be responsible for errors or mistakes in the transmission and delivery of unrepeated messages, beyond the amount paid for sending the same; and that one-half the usual price will be charged for repeating the message is a reasonable regulation, and that parties sending messages on blanks containing such conditions are bound by it.

Under these instructions, the jury found a verdict for the Company, thereby adding another to the numerous decisions sustaining the blank and exempting the Company from liability for errors in unrepeated messages.

REMOVING FALSE IMPRESSIONS.

WORCESTER, MASS., June 6th, 1873.

To the Editor of the Journal of the Telegraph:

Noticing in your paper an extract from the *Springfield Republican*, which has also been copied and enlarged upon by various other papers throughout the country, I would take occasion to say, that so foolish an affair does not merit the attention it has received. The facts are these: Two boys employed by the B. & A. R. R. Co., as night operators, one located at South Framingham depot, Mass., and the other at the B. & A. depot in this city, fell into a foolish quarrel over the wire. The more foolish of the two, unable to restrain his passions, took the first train for Worcester during the night, and upon reaching the depot in this city pummelled his foe in a fashion to satisfy his desire for revenge. Neither party were in any way connected with this office, or the service of the Western Union Telegraph Company. As I have been somewhat annoyed by anxious inquirers from different parts of the country, and wishing to remove any false impressions which may have arisen, I desire to make the above statement regarding an affair which otherwise I should consider unworthy of notice.

E. W. BRADFORD,
Manager.

COURTESY APPRECIATED.

One of the resolutions adopted by the Congressional excursionists who have been visiting the South on a tour of examination, expresses special recognition of the liberality of the Western Union Telegraph Company, in affording to them the use of their wires. Superintendent Clowry is also thanked for his attention to the comforts of the party.

DUPLEX TELEGRAPHY.

(*Correspondence of the London Telegraphic Journal.*)

I note in your Journal of the 15th February, in your article on "Duplex Telegraphy," that Mr. Baggs was the first to add the condenser to the existing apparatus. I had supposed myself familiar with all that had been made public in Europe or this country in double transmission, but the fact, or the mode of the application of a condenser by Mr. Baggs is new to me. Will you be so kind as to note in your correspondent's column in what book I can find an explanation thereof?

The Stearns's duplex has been used for several years in the United States. The longest circuit worked at present is New York and Chicago, 1,000 miles. This is really worked in two circuits, with an automatic repeater at Buffalo, half way. Operators prefer working it to a single wire system, getting off much more business in a day. Two weeks ago, between Buffalo and New York, over 1,600 messages (averaging 25 words each) were handled between 8 a.m. and 6 p.m.

Until its application to very long circuits, with large conducting wire, No. 6, a condenser was unnecessary. But when tried between Chicago and Buffalo, it was found that when the sending key opened, changing from battery contact to ground, and closing one before breaking the other, a portion of the charge in the wire, reversing its direction, flowed back, discharging through the sending relay, and making a false dot, or, as the operators term it, a "kick." A condenser of the same capacity as one half the line wire, was then put upon the rheostat circuit, and upon moving key from battery to ground, the discharge from the line through *one* coil was balanced by the discharge from the condenser through the other. This entirely removed the "kick."

Stearns's system is at work on many circuits of 150 to 400 miles, and is doing splendid work. Mr. Stearns is now in England, with Mr. Prescott and General Eckert. He has a set of his apparatus with him, and will, I doubt not, exhibit its capabilities to all. Like all double transmission systems since Gintl, it follows the general path, varying only in a few essentials, which, though trifling in appearance, have made what was before an experiment and a toy a valuable adjunct to telegraphy.

Mr. Prescott and General Eckert will bear testimony to the efficiency of Stearns's system, as will all telegraph officials in this country.

I am, &c.,
C. H. HASKINS,
Gen'l Sup't, Milwaukee, U.S.A.

North Western Telegraph Company,
Milwaukee, Wis., April 11, 1873.

PUBLIC BENEFACTORS.

Mr. Z. G. Simmons, of Kenosha, who is well known in the Northwest as President of the North-Western Telegraph Company, and Director of the Western Union Telegraph Company, a large owner of several important manufacturing enterprises, has made a proposition to the City of Kenosha, to improve the city park at that place handsomely, and to erect thereon a fine library building, and put into it a $20,000 library, all the improvements, including library, to cost $50,000, all from his own private means.

Mr. Hiram Sibley, of Rochester, N. Y., also a Director of the Western Union Company, has, in addition to his original gift of $60,000 to Cornell University, donated a further sum of $30,000 to the same institution.

ON THE NATURE OF ELECTRICITY.

By M. Edmund.

We recognize the existence of a subtle substance, elastic in the highest degree, pervading not only all space but even ponderable matter.

We also recognize the fact that if two molecules of this subtle matter or ether are placed apart they repel each other in the direction of their line of junction, and in reverse ratio to the square of the distance. This ether resembles in the highest degree a common gas.

Regarding the nature of this ether and its action, as compared with other kinds of matter, we find that it moves freely from one point to another in certain bodies termed "electric conductors." In this respect it is like common gas in its expansion; the molecules move with the utmost facility and change their places with the slightest effort. But, however, in a non-conductor this facility or mobility is checked, so that the movements of the ether are wholly dependent upon the nature of the molecules of the body in which it is placed.

If the non-conductor is a gas or liquid, the ether, although present, has no mobility, but moves about with the molecules of the non-conductor, as it were, mechanically. At the same time the ether distributes itself equally throughout the fluid non-conductor, and in doing so changes or rearranges the molecules of the liquid, according to the Archimedean principle. The action, however, takes place not by the force of gravity but through the repulsion of the molecules of the ether.

The well-known diamagnetic experiments of Plücker have thrown much light upon the application of this principle. He found that if a magnetic body was suspended in a liquid, but of less magnetic power than the liquid, it would be repelled by the poles of the magnet, and also that a diamagnetic body similarly suspended was more strongly repelled than it would be in a fluid or gas less magnetic.

A molecule of ether is at rest when it is equally repelled in every direction. A material body cannot move under the influence of electric action, if the ether which it contains is equally repelled on every side. But if the repulsion becomes unequal, the body will, if free, move in a direction which is the result of the remaining forces.

We know that a body full of positive electricity contains more ether than in its normal condition, and that body, full of negative electricity, contains less than in its normal condition.

We believe that the galvanic current consists in this: that the ether travels from one point to another in the current, and its intensity is the result or product of the density of the ether, and the speed with which it moves; or, in other words, is proportional to the quantity of ether which travels through the circuit in a unit of time.

For a closed circuit the quantity of ether is the same, whether there is a current or not. No ether is created by the electro-motive forces. Their action is limited to converting an oscillating condition of the ether into a translatory or moving condition. But it must be understood that the oscillatory condition of the ether is the normal condition of the ether, but in the form of caloric. As a result of this action the caloric will disappear at the point where the electro-motive forces become active. This phenomena was observed by Peltier.

The origin of the galvanic current is thus very simple. The electro-motive forces create nothing new, but simply change one form of movement into another. In this they resemble the conversions of mechanical forces.

The numerous experiments made to determine the speed of electricity upon wires has never, and can never produce similar results, for the reasons above stated.

PROPERTIES OF COPPER WIRE.

The following table, showing the various properties of copper wire, was compiled by Mr. J. T. Sprague, and published in the *English Mechanic* in 1871. Its extreme convenience and accuracy will render it very valuable to practical electricians, and for that reason we give it a place in our columns. It will be found more correct in practice than the tables and formulæ given in most of the standard works on telegraphy:

PROPERTIES OF COPPER WIRE—Specific Gravity Taken at 8.9.

Line.	I. Birmingham Wire Gauge. (Holtzapffel.)	II. Diameter in Mils. (d)	III. Area in Circular Mils. (d^2)	IV. Weight. Grains per foot.	V. Weight. Pounds per 1000 feet.	VI. Feet per pound.	VII. Resistance at pure copper at 60° in Ohms, per 1000 feet.

In the above table lines 1, 2 and 3 are given chiefly as data of calculation. Line 3 is one cubic inch of copper converted into a foot length. The weights, column 5, and the resistances, column 7, are given for 1,000 feet, for convenience of calculation on the decimal system. When multiplied by 5.28, they give the figures for one mile. Almost any information required may be found from the data given in this table by very simple calculations. For example, if we wish to learn the resistance of a pound weight of any size, it can be ascertained by dividing the number in column 7 by that in column 5.

Line 18 is the wire, of which one foot in length weighs one grain, which forms the basis of calculation. Line 23 is a wire of one mil. or .001 in diameter. These two lines, therefore, furnish constants applicable to calculations of every description.

New Wire over the State Line Railroad.—Poles are being set for a new line of telegraph along the State Line Railroad from Rochester to Warsaw, N. Y., and will soon extend over the whole line. The wire for the Warsaw division has been received, and the work is progressing with despatch. It was the intention to have the line completed to Warsaw by the first of June, and it will be operated for general business by the Western Union Company. The new line will prove a great public convenience.

SCIENTIFIC EXECUTIONS.

Since juries in this State have become impressed with the fact that murder is a crime punishable by death, and not a mere vagary of an "emotional" or other form of insanity, we have remarked some comment relative to the question why the present barbarous mode of execution is not superseded by one of the ready methods of taking life known to science. Hanging by the neck is supposed to cause a dislocation of the vertebræ, but its object is rarely effected. The distance a man should be dropped or jerked upward in order to break his neck depends upon his size, weight and other physical peculiarities, so that it can only be guessed at; and consequently the estimate is frequently incorrect, and strangulation ensues. It is asserted by many that death from the latter, as well as from any other cause involving a stoppage of the supply of air to the lungs, is painless; and, as when respiring foul or noxious gases insensibility supervenes without previous ill-feeling, so the criminal, the moment his weight is brought upon the rope, becomes unconscious, although strong muscular movement may continue. This, however, is a disputed question, and the majority of opinion inclines to the belief that strangulation is attended with all the agony indicated by the contorted features of the sufferer.

Two recent executions in this vicinity, at one of which the pulse of the criminal beat at 108 after five minutes of suspension, clearly show that no matter how great care be taken to ensure speedy death, an absence of suffering due to failure of the preparations at the last moment cannot be guarded against. Hence it is well to consider why a death absolutely certain and painless could not be substituted for the gallows. The advocates of hanging point to its horrible nature, and the degradation of being strung up like a dog in the presence of witnesses, as a moral preventive of crime; but it is doubtful whether a person disposed to murder ever gives a thought to the nature of the penalty, or, even after imprisonment, shudders at aught other than the unknown pangs of death. Of the many mechanical means of execution proposed and practised, probably the surest and most bloodless is the Spanish garotte, but in this, as in hanging, there is a savor of barbarity of which a civilized community can well afford to rid itself.

It seems to us that, for the purpose, no better agent than a powerful electrical discharge could be employed. Professor Tyndall has investigated the effect of lightning strokes upon the human frame, and has arrived at the conclusion that animation and consciousness are instantly suspended; in other words, life is blotted out the moment the current passes through the body. The Professor involuntarily made himself the subject of an experiment of this kind, though fortunately without harmful results. He states that, while delivering a lecture before a large audience, he accidentally came in contact with a wire, from which he received the discharge of a powerful battery of Leyden jars. For a time, he says, his existence was suspended; he was utterly unconscious, although he did not fall nor alter his position. Then, as the effects passed away, he describes the sensation to be as if he had been blown in pieces, each limb feeling separate, and one member after another regaining sensitiveness until he had entirely recovered. The recognition of his surroundings, suggesting where he was, and also the thought of not alarming his audience, were his first efforts of mental consciousness.

While these experiences of Professor Tyndall go to show the instantaneous and deadly effect of large quantities of electricity upon the human frame, other investigations that have been made upon the

Digitized by Google

lower animals have given different and varying results. Professor Pepper, in one of his lectures in this city, stated that at one time experiments were made in London in order to determine whether cattle could not be slaughtered by this means. It was found that sheep, after receiving a discharge, underwent powerful muscular contortions, which engendered a strong doubt as to whether sensation were absent. Pigeons were very difficult to kill, and indeed, the only bird which appeared instantly affected by the shock was the common turkey. These facts may be explained by the non-conducting qualities of the wool of the sheep and the feathers of the birds, and in addition the inference may be fairly drawn that such experiments made upon animals afford no data which may with certainty be considered as applicable to man.

The objection that electrical executions would be free from the horrible impressiveness of hangings might be easily obviated. The criminal, for instance, could be exposed upon a platform, in full view of the assembled witnesses, and manacled to a chair, his irons being connected with a battery and Ruhmkorff coil capable of giving, say, an 18-inch spark. The mode of closing the circuit might be a simple button, to be pressed by the finger of the sheriff. Then, when the usual formalities conclude, the latter official establishes the current, the convict instantly expires, and all is over. There would be no slipping nor breaking of ropes, no black cap, no suspension of a writhing form for twenty minutes or half an hour, none of the grim watching for death by the medical attendants, nor any of those hideous surroundings which now only serve as food for sensation-mongers, and prove that a relic of barbarism can still be maintained in the laws of a civilized country.—*Scientific American.*

THE TELEGRAPHIC JOURNAL AND ELECTRICAL REVIEW.

EDITED BY THE

Rev. WILLIAM HIGGS, M.A., LL.D.

Published in London on the 1st and 15th of each Month, and delivered to Subscribers here at $4.50 per annum.

Back Numbers furnished from its commencement, in November 1872.

MAY NUMBER THIS DAY RECEIVED.

D. VAN NOSTRAND,
IMPORTER AND PUBLISHER,
23 MURRAY ST. and 27 WARREN ST.

SECOND HAND REGISTERS & RELAYS.

We have a lot of the above, of various manufactures, which we have put in good order, and will sell at low prices.

L. G. TILLOTSON & CO.,
No. 8 DEY STREET, N. Y.

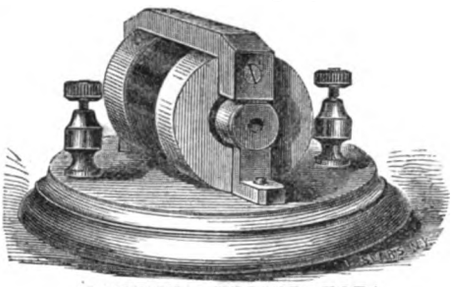
SOLE AGENTS FOR

RICHARD JOHNSON & NEPHEW'S
CELEBRATED LINE WIRE.



Manufacturers, Importers and Dealers in

EVERY DESCRIPTION OF

TELEGRAPHIC & ELECTRICAL APPARATUS.

SOMETHING NEW.

"The Rattler" Telegraph Sounder.

(PATENT APPLIED FOR.)

This is a very simple and effective Instrument, and, as it does not require any spring to draw the lever back, is always adjusted.

PRICE, - - - - $3.50.

L. G. TILLOTSON & CO.,
No. 8 DEY STREET, N. Y.

TILLOTSON'S EXCELSIOR Telegraph Instrument.

(PATENT APPLIED FOR.)

This apparatus is constructed of the best material, and finished equal to any Telegraph Instrument, and is warranted first class in every particular. It is especially adapted to the requirements of Students of Telegraphy and the operation of Private Telegraph Lines.

Price, complete, Sounder and Key mounted on finely finished, Mahogany Base, with one Cell Hill's Patent Battery, with Chemicals, eight feet of Office Wire, and "Smith's Manual of Telegraphy"	$7 50
Two sets	14 50
Price of Sounder and Key only	6 50
" " " with Cut Out and Lightning Arrester attached	7 50

SEND FOR CIRCULAR.

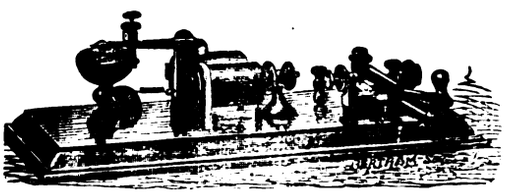
WATTS & COMPANY,

Baltimore,

MANUFACTURERS OF

Electrical and Telegraph Instruments



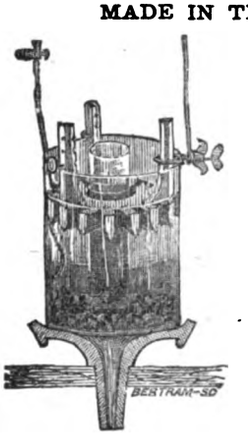
AND

MATERIAL OF EVERY DESCRIPTION,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER.



ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

SOLE MANUFACTURERS OF THE

NEW PATENT BALTIMORE BATTERY

MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7½ inches,
Specially adapted to Railroad Signals, Printing Instruments etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country having proven the cheapest, and least trouble to maintain of any in the market.

Patented Dec. 31, 1872.

ALSO, SOLE MANUFACTURERS OF THE

Patent Circuit Closer Key,
O'Sullivan Self-closing Key,
Scott's Patent Hotel Annunciator

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE

PATENT BATTERY INSULATOR

shown, holding a cup of the Baltimore Battery in the above cut, which most effectually insulates the Battery as the drip passes off through a hole in the Insulator.

The Electrician of the Western Union Telegraph Company, Mr. PRESCOTT, says of it:—"I think your Battery Insulator a very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.
Repairers' Tools constantly on hand.
Importers and Dealers in best English and American Galvanized Wire.
MANIFOLD PAPER, for Train Orders, etc. Also, AGATE PENS.
In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices

INSTRUMENTS REPAIRED AT SHORT NOTICE.

The Amateur's Telegraph Apparatus.

(PATENTED APRIL 16TH, 1872.

This is no toy, but a *bona fide* Telegraph Instrument, with a full-sized trunnion lever Key, with friction Circuit Closer and a Pony Sounder, both on same base.

The battery used is Hill's Patent Gravity Battery, which is considered to be the most constant and economical Telegraph Battery in use. A small size is made expressly for the above apparatus.

With each Instrument is furnished:

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners.

This is sufficient outfit for the student; and all can be set upon a table, or the battery can be set upon a shelf near the table.

In operating a short line, there will only be required, in addition to the above, more cups of battery, according to the length of line.

A Complete Outfit for a Telegraph Office,

WITH BOOK OF INSTRUCTION,

FOR

Seven Dollars and Fifty Cents.

Manufacturers and Dealers in

Telegraph Instruments and Supplies

OF EVERY DESCRIPTION,

38 Vesey Street, New York.

New and Superior patterns of

STANDARD TELEGRAPH INSTRUMENTS.

Their RELAYS, SOUNDERS, and KEYS which have been specially designed by Mr. F. L. Pope, are elegantly designed, thoroughly well finished and scientifically adapted to the service required and are recommended as SUPERIOR TO ANY HITHERTO OFFERED.

In addition to these ALL DESCRIPTIONS OF TELEGRAPH MATERIALS AND SUPPLIES are furnished, such as

INSULATORS, BATTERIES,
INSULATED WIRES,
CHEMICALS., ETC, ETC.
MAGNETIC AND DIAL INSTRUMENTS.

We have for sale also THE NONPAREIL TELEGRAPH INSTRUMENT for amateurs, learners and short lines.

A COMBINATION SET, comprising Sounder and Key on a handsome rosewood base.

Bradley's Box Relays and Sounders.
Bradley's Apparatus for Electrical Measurement.
Bradley's Naked Wire Helices and Magnet Spools to order, any desired size and resistance, at manufacturers' lowest price.

Descriptive Circular and Price Lists forwarded upon application to

F. L. POPE & CO.,

THE

LECLANCHE BATTERY CO.

Is now prepared to supply promptly the increasing demand for

This Celebrated Battery,

(SECURED BY LETTERS PATENT IN THIS COUNTRY)

and which is extensively used throughout Europe for

TELEGRAPHY,
RAILROAD SIGNALS,
HOTEL ANNUNCIATORS,
BELLS, ETC.

Among the numerous advantages of this Battery may be mentioned—

ENTIRE ABSENCE OF ACIDS,
ITS GREAT CLEANLINESS,
WONDERFUL DURABILITY,
GREAT ECONOMY IN RUNNING EXPENSES.

This Battery will last, without any Attention, from six months to a year.

A number of cups have been in use by the Western Union Telegraph Company, *on a closed circuit*, since Nov. 26, 1872, nothing but water having been added since they were first set up.

For further particulars apply to

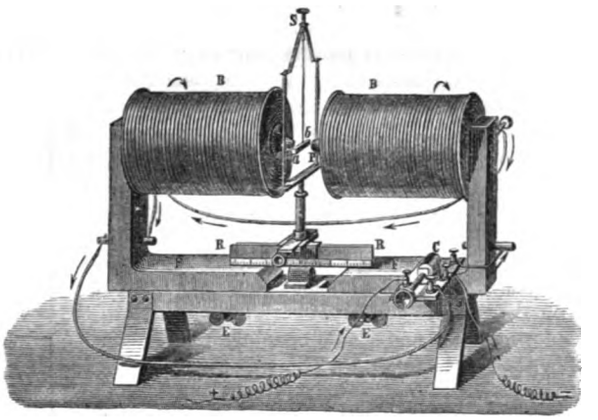
JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 15. NEW YORK, JULY 1, 1873. WHOLE NO. 136.



ACTION OF MAGNETISM ON ALL BODIES.

It has long been known that iron and steel were not the only substances which could be acted on by magnetism. Nickel and cobalt especially were known to be attracted by a magnet, though very much more feebly than iron, while bismuth and antimony were repelled. Faraday, by means of a powerful electro-magnet, showed that all, or nearly all, substances in nature, whether solid, liquid, or gaseous, were susceptible of magnetic influence, and that they could all be arranged in one or the other of two classes, characterized by opposite qualities. This opposition of quality is manifested in two ways :

1. As regards attraction and repulsion, iron and other *paramagnetic* bodies are attracted by either pole of a magnet, or, more generally, they tend to move from places of weaker to places of stronger force. On the other hand, bismuth and other *diamagnetic* bodies are repelled by either pole of a magnet, and in general tend to move from places of stronger to places of weaker force.

2. As regards orientation, a paramagnetic body, when suspended between the poles of a magnet, tends to set *axially;* that is to say, tends to place its length along the line joining the poles, or, more generally, when placed in any magnetic field, tends to place its length along the lines of force. Hence the name *para*magnetic. A *dia*magnetic body, on the other hand, when suspended between the poles, sets *equatorially;* that is to say, places its length at right angles to the line joining the poles, or, more generally, tends to place its length at right angles to magnetic lines of force.

The accompanying cut represents the apparatus commonly employed for experiments on this subject. B, B are two large coils of stout copper wire, wound on massive hollow cylinders of soft iron. These latter form portions of the heavy frames, F, F, which can be slid to or from each other, and fixed firmly at any distance by means of the screws, E, E. The armatures, P, which can be screwed on or off, have the form of rounded cones, and produce a great concentration of force at their extremities.

The action of magnetism upon a solid can be examined by suspending a small bar of it *a b*, by means of a special support R S, between the poles P. When a current is passed through the coils, the bar immediately exhibits a preference either for the axial or the equatorial position. Attraction and repulsion are most easily tested by suspending a small ball of the substance at the level of the central line of poles, but a little beside it, the poles having first been brought very near together. On passing the current through the coil, the ball will move inwards towards the lines of poles if paramagnetic, and outwards if diamagnetic.

It is important, however, to remark, that experiments of this kind, unless performed *in vacuo*, are merely differential—they merely indicate that the suspended body is, in the one case, more paramagnetic or less diamagnetic ; in the other case more diamagnetic or less paramagnetic, than the medium in which it moves, the comparison being made between equal volumes. Oxygen is paramagnetic, and nitrogen is nearly or quite indifferent. Air is accordingly paramagnetic, and a body suspended in air appears less paramagnetic or more diamagnetic than it really is. If more feebly paramagnetic than air, it will appear to be diamagnetic. Thus, heated air, in consequence probably of its rarefaction, appears diamagnetic when surrounded by cold air, and the flame of a taper is repelled downwards and outwards from the axial line.

If, on the other hand, the body under examination is suspended in water, it will appear more paramagnetic than it really is, by reason of the diamagnetism of water.

The following metals are paramagnetic : iron, nickel, cobalt, manganese, chromium, titanium, cerium, palladium, platinum, osmium.

The following are diamagnetic : bismuth, antimony, lead, tin, mercury, gold, silver, zinc, copper.

The following substances are also diamagnetic: water, alcohol, flint glass, phosphorus, sulphur, resin, wax, sugar, starch, wood, ivory, beef (whether fresh or dried), blood (whether fresh or dried), leather, apple, bread.

The orientation of crystals in a magnetic field presents some remarkable peculiarities which were extremely perplexing to investigators until Tyndall and Knoblauch discovered the principle on which they depend, This principle is, that crystals are susceptible of magnetic induction to different degrees in different directions. Every crystal (except those belonging to the cubic system) has either one line or one plane along which induction takes place more powerfully than in any other direction ; and it is this line or plane which tends to place itself axially or equatorially according as the crystal is paramagnetic or diamagnetic. The directions of most powerful and least powerful induction are found to be closely related to the optic axes of crystals, and also to their planes of cleavage. When a sphere cut from a crystal is brought near to one pole of a magnet, it is attracted or repelled (according as it is para- or dia-magnetic) with the greatest force when the direction of most powerful induction coincides with the direction of the force.

Directions of unequal induction can be produced artificially in non-crystalline substances by applying pressure. "Bismuth is a brittle metal, and can readily be reduced to a fine powder in a mortar. Let a tea-spoonful of the powdered metal be wetted with gum-water, kneaded into a paste, and made into a little roll, say an inch long and a quarter of an inch across. Hung between the excited poles, it will set itself like a little bar of bismuth—equatorial. Place the roll, protected by bits of pasteboard, within the jaws of a vice, squeeze it flat, and suspend the plate thus formed between the poles. On exciting the magnet the plate will turn, with the energy of a magnetic substance, into the axial position, though its length may be ten times its breadth,

> "Pound a piece of carbonate of iron into fine powder, and ferm it into a roll in the manner described. Hung between the excited poles, it will stand as an ordinary [para] magnetic substance—axial. Squeeze it in a vice, and suspend it edgeways, its position will be immediately reversed. On the development of the magnetic force, the plate thus formed will recoil from the poles, *as if violently repelled*, and take up the equatorial position."*

In these experiments the direction of most powerful induction is a line transverse to the thickness, and this is also the direction in which pressure has been applied. Tyndall accordingly concludes that "if the arrangement of the component particles of any body be such as to present different degrees of proximity in different directions, then the line of closest proximity, other circumstances being equal, will be that chosen by the respective forces for the exhibition of their greatest energy. If the mass be [para]magnetic, this line will stand axial ; if diamagnetic, equatorial."†

A NEW TELEGRAPH INSTRUMENT.

M. G. M. Phelps, of the Western Union Telegraph Company, has recently completed a printing instrument, for the use of the Gold and Stock Telegraph Company, which is really remarkable for its ingenuity and compactness. This instrument works on one line wire, without local batteries, has two type wheels, one for letters and the other for numerals, with a device for shifting the impression instantaneously from one to the other, and is capable of working continually at the rate of forty words per minute. The whole affair is, perhaps, eight inches in diameter, and of about the same height. Mr. Phelps may well take an honest pride in this creation of his mechanical genius, as it is, probably, the most elegant printing instrument ever yet produced. It is probable that this machine will, in time, be exclusively used by the Gold and Stock Telegraph Company for their work, as its speed of transmission is nearly or quite five times as great as the one now in use by them.

* Tyndall on *Diamagnetism*, p. 18. † Ibid, p. 23.

ON THE BLOCK SYSTEM OF TRAIN SIGNALING.

At a meeting of the Society of Telegraph Engineers, held on Wednesday, April 23, 1873, two papers, "*On the Block System of Working Railway Traffic*," were submitted.

The first paper was by Mr. W. H. PREECE. The author was afraid that electricians would be disappointed at the character of the paper which he was about to read, and that those of the railway world would be affronted at the position which he took in assuming to himself the functions of a mentor. But, in fact, the railway system of this country is as yet far removed from the summit of the engineer's ambition—a perfect working machine, though it is certainly approaching that point. While the carefully prepared statistics of the Board of Trade show that the traffic is increasing with marvellous rapidity, the average number of total accidents is stationary. In the three years ending 1849 the average number of passengers killed, by causes beyond their own control, was 12, being (roughly) one in 4 million passenger journeys made. In the year 1871 the number killed was the same, while the proportion to the passenger journeys made was one in 31 millions. We have in these statistics the most powerful evidence of improved working, and of the beneficial effect of that process of scientific thought which is the application of the lessons taught by past experience to new and different circumstances. The reports of the inspecting officers of the Board of Trade upon the accidents which occur show exactly where the shoe pinches, and favor the application of the law of average in bringing out the defects or merits or variations in railway working.

Dangerous modes of working are frequently carried on for long periods without accident, but they invariably break down at last. One railway company may use an imperfect system for many years without accident, but, if twelve different companies adopt the same system, the probability is that before many months elapse something will show a defect which requires to be cured. The published reports of the Board of Trade furnish experimental data from which a pure science of railway working can be formed. A careful examination of 138 accidents which were reported upon has enabled the author to summarise the causes of accidents into four heads. Those due to defective permanent way have formed 18 per cent.; those due to defective rolling stock, 13 per cent.; those due to defective human machinery, 41 per cent.; those due to defective signaling arrangements, 28 per cent. Of these accidents, 56 per cent. were the effect of collision always preventible.

Now, the question naturally arises, why should there be such a wide difference in the safety of trains traveling upon the southern lines as compared with the northern lines? Is it that the elements of accident are more abundant in the latter than in the former; that the traffic is more crowded; that there is a greater variation in the character of the trains; and that the speed is higher? Or is it that the systems are more lax, and that the accommodation is more defective? The author cannot answer these questions; but there is one fact strikingly evidenced on the southern lines as compared with the northern lines, namely, that upon the southern lines the block system is carried out in its entirety to a greater extent than upon the northern lines. Of the 16,000 miles of railway in the United Kingdom only about 4,000 are worked upon the much-talked-of block system. Now, what is the block system? It is that system by which trains are kept apart, upon the same line or rails, by a certain and invariable interval of space, instead of by an uncertain and variable interval of time. The term "block" itself is a most unfortunate one. It was introduced in the early days, through the practice of blocking or pinning over the telegraph needle in the early instruments used to work this system. The "*space* system," in opposition to the "*time* system," would have been far more appropriate. The practice under the time system is to exhibit the danger signal for five minutes, and the caution signal for five minutes more, after a train or engine has passed any station, junction, level, crossing or siding. Trains are thus kept apart by fixed periods of five minutes, and, if the caution signal were more properly regarded, they would be kept apart by an interval of time even longer than this. The speed of a train is entirely the responsibility of the driver. Immunity from accident is dependent upon his keeping a clear look-out. If engines ran at regular and fixed speeds, if the driver could always insure a good view before him, and if the signals were near together and were properly regarded, a rigid interval of time might be maintained between following trains. But none of these elements of safety are constant. Fast expresses follow slow goods trains, now through a thick fog, and then in bright sunshine. Trains are so frequent in some places, that the interval cannot be adhered to; obstructions to view arise from curves and cuttings, and atmospheric causes; long lengths of line are unprotected by signals, and signals themselves are frequently neglected. Hence the time system is brimful of elements of danger, and the inexorable logic of facts has shown that the time interval is illusory, and the system unsafe. When trains are invariably kept apart by an interval of one or two miles, collision between them becomes impossible. This is the block system. This system has very improperly been divided into two classes—the "absolute" block and the "permissive" block. The absolute block is the block system proper. The permissive block is not a block system at all, but a system introduced by the London and North Western Railway Company, at the suggestion of Mr. Edwin Clark, not to secure the safety of their trains, but to increase the capacity of their line for the transmission of their enormous and increasing traffic. It is, doubtless, an improvement on the time system, but it bears little affinity to the block system, and should certainly not be included in the same category. There is a very broad distinction between the block system, as an abstract principle, and the means of carrying out that principle. We hear of Tyer's, of Walker's, of Spangaletti's, of the needle, and of other block systems. They are *not* block systems, but simply instruments devised to carry out the electrical portion of the block principle. The carrying out of the block system means an entire re-arrangement of the rules and regulations of the working traffic, a complete re-organization of the signals, the construction of fresh siding accommodation, the education of the staff, the transference of much responsibility from the drivers to the signalmen. Moreover, the working of the block system is not necessarily an electrical question. If the sections of the line be very short, it can be worked by mechanical or by pneumatic agency, and, where the sections are long and the trains are few, it can be worked by a staff. On busy occasions, when the trains are numerous, it is quite possible to work the block by ocular agency, by merely planting men within sight of each other, to regulate the trains by flags and other means. The time system having been proved to be inefficient, and the block system having been shown to be the safer principle, how is it that the adoption of the block system in this country has been so slow? People as a rule are very sceptical of any new invention until it has been practically established for a long period, and particularly so when it is based upon principles which are not understood. It took the public a very long time to get used to railways, and it took railway authorites a much longer time to get used to the telegraph. Even now the telegraph is looked upon as an expensive auxiliary, bringing in no returns; or, at least, this was the case before the transfer to the Government. The accidents it has prevented and the lives it has saved are unknown. It is the last thing thought of in the construction of a line: it is the very first thing flown to in moments of danger and difficulty. But its principles are not understood; and the application of electricity to signaling purposes is still less apprehended. On the London and South Western the first outlay in the construction of the block was £125 per mile, The annual cost of maintenance is £60 a mile. On the London, Chatham and Dover the first cost was £174 a mile; the annual maintenance £60 a mile. On the Midland line the annual cost is between £30 and £40 a mile on the main line between London and Bedford, according to returns furnished to the Board of Trade, but this sum probably referred only to the electrical portion of the system. The South Western figures, probably, more nearly represent the total cost of maintenance. The electrical appliances form but a small item of the cost of the total block system, the expense being chiefly due to the signal boxes, interlocking apparatus, and other accessories. But in addition to the question of cost which has delayed its introduction, there is a certain amount of prejudice against its working. It is said to introduce delay, and to be objectionable, because it removes the responsibility from the driver to the signalman. Experience had shown that, under proper regulations, there is not only an absence of delay, but absolute expedition in working, with the block system, and that the capacity of a line for the conveyance of trains is largely increased thereby. And, as regards the responsibility of the driver, this had, if anything, been increased, for the correct working of the block depends essentially upon the driver paying proper regard to the signals. But, in addition to this, the block system has instilled into the driver an amount of confidence which he never felt before, and checked that daring recklessness that was at one time so prevalent. Thus prejudice, cost, and indifference, have led to the neglect of the block system. These objections are, however, rapidly dying out, and most of our great railway companies are now largely extending the block. In the external visual signals uniformity should be secured. The author is far from advocating the block system as the cure for every evil. We know well that where we are dependant upon human agency mistakes will arise; and various defects in connection with the permanent way and rolling stock might be a cause of accident. But the author contends that a compulsory block system would cause other improvements to follow in its wake.

The second paper, on the same subject, was read by Major Mallock. The author was lately ordered by the Government of India to report on the use of the telegraph in connection with railways in England, and the paper contained some of the results which he had arrived at in pursuance of that order. The block system, as used in England, is chiefly applied to double lines, and may be distinguished by the general name of the non-following block, in contradistinction to the non-meeting block which is necessary on single lines. There are various methods of carrying out the block system, any one

Digitized by Google

of which, looked at by itself, is apparently perfect, but to choose between them it is necessary to know what is really required. No rules on the subject have been issued by the Board of Trade. There are seven main classes of instruments now used with the block system. There are also variations of them, but these all depend on the main classes. There is, first, a double needle instrument, combining a bell, introduced by Mr. Edwin Clark on the London and North Western Railway, in 1854; second, electro-magnetic semaphores combined with bells, introduced by Mr. Preece in 1862; third, variations of Clark's needles and bells, introduced by Spangoletti in 1862; fourth, the working of bells alone, introduced by Walker on the South Western Railway in 1861; fifth, an electro-magnetic semaphore combined with bells, introduced by Mr. Walker in 1866; sixth, two indices combined with a bell, introduced by Tyer in 1869; and, seventh, a modification, introduced in 1872, of Preece's original instrument of 1866. The first three of these instruments are usually called three-wire systems, and are worked by a permanent current. They require one wire for each line of rails, *plus* one wire for the bell. The last four are called one-wire systems, and are worked by a temporary current. A needle instrument of any sort permits of talking, and is otherwise dangerous. At first sight needle instruments seem so cheap, and so easy to understand and repair, that a person not acquainted with the subject would be apt to prefer them, but there are in connection with them certain imperfections and dangers. The theory of working them is, that a constant positive current kept on the line by the commutator being pinned over will show the line blocked, whilst a negative current shows the line clear, or *vice versa*. In actual practice, however, line clear is only signalled on the train arriving, and then the needle is allowed to fall to zero, the result being that, should the needle be pinned over and the line blocked, the needle will fall to zero. The theory is that a man ought not to consider the line clear unless he has had a call on the bell, or the needle be put over to line clear until he has answered. It will be readily seen how easy it is in practice, when a man is hurried, for him to make a mistake. The Board of Trade inspectors have expressed their opinion that a talking instrument is most necessary, but still it is only as an adjunct to the block system. A flash of lightning may reverse the magnetism of the needle instrument so that it will show "line clear" when it is meant that the line is blocked. Of the one-wire system there is no use in contemplating. Walker's bell without indices, when the introduction of the latter is a great safeguard and not much expense. In Tyer's instruments the workmanship is exceedingly good, and they are apparently the most sensitive instruments, and calculated to work the longest distances, but, like needle instruments, they are liable to have reverse signals given on them by atmospheric electricity. Also the plungers, which give the signals "Line clear" and "Train on line," are so much alike that they may be mistaken by a man in a hurry. Walker's instrument is strong, but possesses somewhat similar disadvantages. In Preece's instrument (worked by a single wire) the commutator which charges the signals "Train on line" and "Line clear" is a miniature semaphore lever, and therefore there is much less chance of mistake than with the other instruments. It also admits of interlocking, like Varley's system. In consequence of a recent addition, the signal "Line clear" cannot be given unless both sender and receiver are concerned in making it, and therefore atmospheric currents will cause no mistake. The single-wire systems are generally used for the non-following block; but where there is a single line of railway, and the non-meeting block is used, the rule is that no second train goes into the same section in either direction. In India, however, they got into a complication with single lines which is not contemplated by either of these systems, namely, that the line being blocked ahead with trains going up, any number may go down it. That is the permissive block system. If absolute block is to be introduced in India, either this plan must be prohibited, or they must provide for a non-following block *plus* a non-meeting block. The author proposes to do this by two wires:—

$$A \left\{ \begin{array}{l} -B-C-D- \\ \_\_\_\_\_ \end{array} \right\}$$

Looking upon A and E as two sidings, and B, C, D as cabins between them, the lower line of the diagram would be a non-meeting block, whilst the lines between the cabins would be a non-following block. The manager of the South Western Railway has said that such a system combined with a train register would be perfect. The paper then gave some particulars of a conference of railway managers and others, held at Berlin on the 1st of December, 1870, with reference to the block system, and detailed a series of principles which were adopted at that conference. The author concluded with a series of twenty-four rules, which he had deduced from his investigations as to the working of the block system in England, and which coincided with the spirit of the principles laid down by the German Conference, but were somewhat more comprehensive. The rules so laid down by the author consisted of a series of affirmations to the following effect:—The block system entails no loss of time, but, on the contrary, enables a far greater traffic to be carried on. It is essential to the safe working of a line. The system of the "permissive" block is most dangerous. It is of no use to establish a block system if the sections are too short for a train going at full speed to stop in, or if a slack method of working be permitted. Any station at which shunting is or may be carried on must be guarded by the block. A private code of signals between the men must not be allowed. Whatever system of block is introduced, a train register is wanted. On dangerous sections a train should report back its own arrival. Besides block instruments, talking instruments should be provided, and these must not be interposed in circuit with others, but each section must work separately. On exceptional sections the block instruments should interlock with the semaphore levers. "Line clear" should not be signalled back until the tail-board of a train is seen, lest any of the carriages should be left on the line. The line staff has proved inoperative without the assistance of the telegraph. Electric repeaters are required. The block system is as necessary with light as with heavy traffic. Where a bell-code is in use, a large number of beats is liable to lead to confusion. Needle instruments which can be used for talking are objectionable as block instruments. It should be impossible to show "Line clear" unless the signalmen at both ends are concerned in making the signal. Plungers, such as those of Tyer and Walker, which may be mistaken in the hurry of working, are dangerous. At the junction of two lines the block instrument should interlock on the principle of Saxby and Farmer's interlocking semaphore levers, so that "Line clear" cannot be telegraphed to both sections at the same time. Exceedingly simple instruments are desirable. The working of the block instrument should approximate as much as possible to the working of the outside semaphore. A single-wire system, working with a temporary current, cannot be considered perfect if lightning can reverse the current or demagnetise the instrument. The receiver must not be able to alter the index of incoming signals at his station.

After the reading of the papers, Mr. W. H. Preece described a collection of electrical signalling instruments, which had been devised from time to time for use in connection with railway traffic.

THE CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

We have received advance copies of the rules and premium list of the Fourth Cincinnati Industrial Exposition, issued in a style in keeping with the character of the Exposition itself. From this it appears that the Exposition will open to the public on Wednesday, September 3, and will continue until Saturday, October 4, 1873.

The halls and grounds will be open for the reception of articles from Monday, August 4, to Saturday, August 30. All articles will be entered for exhibition only, except those specifically named in the published list of articles to which premiums will be awarded.

The exhibitor may choose before August 30, to enter articles for exhibition only which are in the premium list, but all applications for space must be made on or before the 20th day of August, on the printed blank forms, which will be furnished by the Secretary; and applicants after that date will not be allotted space until those entered by the 20th of August have been assigned.

Articles for competition must be of American manufacture, and entered by the manufacturer or his agent, excepting those otherwise stated in the premium list, and all premiums awarded will be for first degree of merit only.

The following is the list of premiums offered for electrical and telegraphic machinery:

Best Electric Engine, Motor for Light Work	Silver Medal.
Best System of Fire Alarm Telegraph (in operation)	Gold Medal.
Best Adaptation of the Telegraph to Domestic Use	Silver Medal.
Best System of Telegraphic Railway Signals	"
" Fire Alarm Signal-box	"
" Telegraph Instrument for Stock Quotations	"
Best Set of Instruments for Electrical Measurement	"
Best Telegraph Battery for Force, Durability and Economy	"
Best Electric Light	"
" Ship Telegraph (Electric or Pneumatic)	"
" Hotel Annunciator operated by Electricity	Bronze Medal.
" Combination of Morse Telegraphic Instruments	"
Best Box Relay with Key attached	"
" Pocket Relay Magnet	"
" Morse Register	"
" Single Cut-out	"
" Best Switch for from four to twenty Wires	"
" Telegraph Sounder	"
" " Key	"
" Electro-magnetic Motor	"
" Magnetic Watchman's Clock	"
" Dial Telegraph Instrument	"
" Lightning Rod	"

The officers of the Board of Commissioners are as follows:

President—W. H. Blymyer.
First Vice-President—D. B. Pierson.
Second Vice-President—L. C. Weir.
Treasurer—Thomas Gilpin.
Secretary—W. W. Taylor.
Assistant Secretary—John B. Heich.

CORRESPONDENCE.

WILL IT PAY?

To the Editor of the Journal of the Telegraph:

Although much has been said on both sides of this new alphabet question, there appears to have been much left unsaid.

Many operators seem to fear that a change of alphabet, more or less sweeping, will be hastily made.

To this class I would say, the question is, simply, will it pay?

The Western Union Telegraph, with its immense and rapidly increasing influence, carries with it, at each step, equally immense responsibilities, which it can neither throw off nor ignore.

The managers of the W. U. Co. are in every sense *self-made men*, and from that class of people we have little to fear from hasty or ill-considered action.

President Orton, whose pen so completely riddled "Postal Telegraphy" and its advocates, and whose clear, far-reaching policy of lowering tariffs, increasing facilities in every way, improving the quality of all supplies furnished, &c., has so effectually screwed down the lid of its coffin, will never allow the change until he is satisfied it will pay.

Three of our General Superintendents I have had the honor of knowing personally more than twenty years. They rose from the operating ranks, not by friends or influence, but as the legitimate result of much careful, thoughtful and steady application to the duties entrusted to them. In other words, by brains.

Not one of them will lend his influence to this change until mature thought has shown it to be of real advantage, in which case we all want it. Whether the telegraph alphabet is the same the world over, or not, an American invention, or whether "Americans must rule America," telegraphically or not, are points more fitting for Fourth of July orations than a place in this discussion.

Write this contemplated change, up or down, as you will, the bottom of the Western Union's crucible will invariably and rightly show these questions?

What will we gain?

What will it cost?

Can we accomplish the object cheaper?

The answer to number one is understood to be lessened liability of errors.

To answer the second question is more difficult.

Our operators use the present alphabet intuitively, giving no thought to formation of the letters, but giving their attention (and it is needed) to other details.

The name of the State messages are from, or going to, correct timing, counting the words, watching the hooks that extra important, or death messages, may be rushed ahead, reading carefully the messages or reports being handled, to discover any error previously made, &c., occupy their time—the whole of it. I think experience would show it expensive to oblige him, in addition to all this, to note carefully the alphabetical changes.

Habits are strong. Witness a foreigner, in excited conversation, or rapid letter writing. Years do not break *his* habits. The old country sentence or word slips in without notice. Will it be easier for a tired and hurried operator to remember his new alphabet? This refers more particularly to our first-class operators.

Now take a small office. The operator is ordinarily railroad agent and express agent; often having other duties still. His telegraph receipts run anywhere from $8 or $10 upward per month, but an error in any message he handles will result as expensively as if made in some large office.

The company cannot, of course, afford a first-class operator there, but he is a reliable, steady, industrious man, who for months practiced hard to learn telegraphing to gain just such a position.

He is expected to, at the same time, sell tickets, check baggage, receive or deliver express packages, and, perhaps, at that very moment is receiving a train order or telegram.

Is it wise to change the alphabet on him? Has he not already sufficient to think of? If, in his perplexity, he makes an expensive error, who foots the bill?

A careful perusal of most of our contracts with railroad companies will add interest to this question.

This is no exaggerated case, for we are doing business with thousands of similar ones every day.

Should the error occur in a train order, and loss of life result, who would foot *that* bill and stand responsibile for the changed alphabet?

To me it certainly seems the risks are greater than the prospective gain. Again, is there no other way to reach this lessened liability of errors? This brings us to the third question, and I unhesitatingly claim that there is a *cheaper* and *more effective* way, viz: by discouraging too rapid telegraphing, and encouraging more care in doing it.

I claim, further, that from the time the JOURNAL published the records of the fastest Morse telegraphing known, complimenting the performers so highly, congratulating the Company in having such operators in their employ, and, in fact, endorsing all attempts to rival them, until now more errors have resulted from attempting to write and receive faster than, in each case, could be done *safely*, than from all errors in spaced or unspaced letters aside from the fast operating mania.

"Way" operators, of comparatively limited experience, reading those articles, and thinking the chief end of (a telegraph) man is to write and receive rapidly, tries it on. He rushes business to some one of even less experience, and after worrying him sufficiently, seats himself and *waits* to get two, or three, or more messages to send together again. Meantime, some old head, hearing and understanding the case, gives *him* a *dose* that nearly takes his breath away. But he is too proud to "break." He answers O K, as coolly as if he had the entire message down, words counted, timed, &c., when, in reality, he is several words behind the signature. He then tries to complete it from memory, and often succeeds, but what are the chances?

Any old-time operator will recognize this picture. If you doubt it, Mr. Editor, ask him. After that, ask yourself if you can afford to encourage it?

The plea that extremely rapid telegraphing is *necessary*, will not do. Moderately fast writing, always evenly spaced, and each letter distinctly formed, will do as much, or more, work in one hour, or ten, will leave no room for errors, and will be an every day model for younger operators to aim to equal.

At the risk of being considered "old fogyish," and a "slow coach" for the age, I have given you the convictions resulting from about twenty-five years telegraphing, and part of it spent in going through this same rapid writing mill. I claim that our system is all right, and our alphabet all right, every letter and every figure *with care*, and that *without* it no system or alphabet is safe. B.

BOSTON, June 23, 1873.

To the Editor of the Journal of the Telegraph:

Judging from the liberal amount of space which the JOURNAL allots in each issue to correspondents on the subject of changing the present Morse alphabet for the "Continental," it is evident that the Western Union Company desires to hear the frank and outspoken opinions of its employees throughout the country. I do not attempt to speak for my associates, but only for myself, when I say that I do not believe that this change will meet with very strong opposition, should it be decided upon. A much more radical change was made a few years ago in Supt. G. W. Gates' district, on the old Vermont and Boston lines. The Bain alphabet had been in use on those lines for years; and if any of your readers will compare the Bain and the Morse signals, a glance will show them what a task it was on the "old sogers" to change. One of your correspondents complains that confusion will arise in making — · — · for C, and · — · for R, in the new system. But what would he say, had he been accustomed all his telegraphic lifetime to read · · — for D; · — · for B; · · · for C; — · · for G; · · · · for L; and so on, if he were told to prepare, within a certain time, to read those same characters for U; F; S; X; and H? Of course the change will cause temporary inconvenience to many; but I doubt if any operator will admit that it will take *him* long to master these difficulties. In fact, some of your correspondents seem to desire to create the impression that they are not speaking for themselves, but for "those dreadful 'plugs' out of town."

Now, this is all nonsense. But, on the other hand, I do not believe the simple getting rid of spaced letters will save the Company from losses on account of mistakes.

Quite as many mistakes are made with the other characters. The "artist" who impatiently told an old operator to "frite gerse" has many imitators in the profession; and no alphabet in Christendom can improve the *key*-rography of these gentlemen. No doubt the managers of the company will examine the subject thoroughly, and consider well all its advantages and disadvantages before they decide upon a change. Some of your correspondents object to the new alphabet on account of its being "longer" than the present one.

Some years ago a friend of mine took the trouble to write a thousand words from a discourse, in both alphabets, and then counted the dots and dashes. I have forgotten the result of his calculation, but the difference was not very great.

Speaking of loss of time, allow me to call your attention to an every day nuisance.

A long message is to be sent. Transmitting operator says: "here's a long one has — words in it." Here is a waste of time, counterbalanced perhaps by the more even "copy" of the receiver; but the same result would be reached if the check were sent at the beginning of the message with the number, as is done on the cable circuits.

Perhaps the operator does not say how long the message is, or, worse still, says nothing at all; and a straggling copy is the result, with perhaps one or two words, or only the signature on the other side of the blank; reproaches, mild and otherwise, follow; perhaps the message has to be repeated, and a minute or two is lost.

All this would be avoided were the check sent before the date. One or two other suggestions I would like to offer, but I must not abuse my privilege in your columns. SHAWMUT.

Digitized by Google

TALLAHASSEE, FLORIDA, June 18th, 1873.

To the Editor of the Journal of the Telegraph:

Much has been said and written of late in regard to the proposed change of alphabet, and presuming you would like to have a free expression of opinion upon the subject, even from points as remote as this, I would say that, as far as I have heard among telegraph men in this State, the proposition to change our alphabet, which originated in the grandest brain among modern scientific men—the glorious Morse—for the interminable, ear-killing combination known as the European or International alphabet, meets with unqualified condemnation. The fault is not in the system, but the men, and it will be a sad day for our craft in America when the musical rhythm of the old Morse alphabet is heard no more in the telegraph offices of our country. We sincerely hope no change will be made. My experience is that as many "bulls" are perpetrated with the dotted letters as are from the too-much abused spaced letters. Without encroaching upon your space, allow me to make a suggestion: Every operator has, doubtless, been a witness to, or is aware of, painful and affecting scenes resulting from the delivery of messages containing the announcement of the death of some relative or friend of the party addressed. Now, Mr. Editor, do you not think it would be well to supply each office with mourning blanks and envelopes, gotten up, and to be used only for death messages? In my humble opinion many a cruel surprise would thus be avoided, and a party receiving such a telegram could tell at once, from the envelope, the nature of its contents, and be in some measure prepared for the shock which such intelligence always brings with it. "K."

To the Editor of the Journal of the Telegraph:

To-day a party called here, and wrote a message for a party in B., and in it requested an answer by boy. We requested him to advance money to cover cost of answer, which he refused to do, saying it was Co.'s fault if he did not get an answer by a reasonable time. He moreover proposed to act as judge as to what time it ought to come, and tendered the money to pay for the message he proposed sending. The party was a stranger and a transient. The course we pursued was, we sent the message which he paid for, and notified B. office we would not be responsible for the tolls on the answer. Did we do right, or should we have refused the message?

WEVERTON, MD.

Answer.—You acted right in the course you pursued. Telegraph companies cannot refuse to transmit any message couched in proper language, and for which payment is tendered. Managers should always bear in mind that, in their business relations with the public, they represent the Company, and no matter how unreasonable a customer may be, he should be treated with courtesy and politeness, and the rules of the service applicable to his case explained to him.

LOGANSPORT, IND., June 16, 1873.

To the Editor of the Journal of the Telegraph:

We received a death message, on 13th, for the battery man of railroad office in this place. We were not acquainted with him, but, after inquiring at the post-office, hotels and places where he would likely be known, we were told by some party on the street that he was employed by the railroad company, but did not know in what capacity, nor if he was a family resident of the city. Our boy took the message to his place of business, and was told that party was out of town, but expected home at any time. We left the message on his hook, where all business for him is delivered. But to-day the party appears, and very furiously accuses us of neglecting our duty; claiming that, being a man of family, the message should have been delivered to his house, and not to his place of business, and where our judgment led us to believe he would get it quickest. He refuses to refer it to our superintendent, but insists on making as great a fuss about it as if he was the worst used man in creation. We contend that our duty was performed, not knowing him to be a man of family, in delivering it to his place of business. Please answer us.

J. E. FRIEND, Manager.

Answer.—You should not have left the message without obtaining a receipt therefor. You should have filled out a No. 26 blank, and left it at his place of business, instead of leaving the message. Otherwise, you seem to have done all that was possible.

To the Editor of the Journal of the Telegraph:

The following appears in issue of June 2d:

Talladega.—There are thirteen words in the following:

"Send mail. Am much improved in health. How are all?

C. P.

Imperial Hotel. Answer."

In above instance you count address of the sender and his request for reply as a part of the message. We do not know of any rules governing this case, but the universal custom has been that such information is transmitted with the message, but *not* counted in check, as in the case of sender putting his title underneath signature, such as Gen'l Supt., Vice-President, Business Manager, et cetera. Please inform us the ground on which you decide as above.

NEW ORLEANS.

Answer.—The decision quoted is based upon justice to the telegraph company. Usage allows the date, address and signature of a message to pass free. If the sender of a message desiree that his place of business or his residence be made known to his correspondent, he should pay for it. Also as to his official title. If he does not wish it transmitted he should so inform the receiver, in which case it should not be counted or charged for.

ST. ALBANS, VT., June 24, 1873.

To the Editor of the Journal of the Telegraph:

Please inform us through the JOURNAL how many words should be counted in the following message: "Send three mowers to St. Armand Station, P Q; three Abercorn Station, P Q. Reply."

St. Armand, Abercorn, and Abercorn Station, are all offices on the Montreal Tel. Co.'s line. Please answer in detail. OPERATOR.

Answer.—It would appear that the question at issue is the counting of St. Armand Station and Abercorn Station. If these are the names of places distinct from St. Armand and Abercorn, they should be counted one word each. If the station in each case is a *thing* situate in the places bearing these names, they should be counted according to the number of distinct words. In the first case there would be ten words; in the second, thirteen. P. Q. is one word in both cases.

CINCINNATI, June 20, 1873.

To the Editor of the Journal of the Telegraph:

Are you not a little awry in your "Union 76" decision in JOURNAL of June 16th, page 213?

How would it be if the sender should leave his name off entirely? I think we are in a measure bound to transmit free after a signature such simple designation as "Master" (applied to the captain of a vessel), Agent, Prest., Supt., Cashr., Secy., &c. In the case named I would transmit free the word "Sec'y," and charge for the remainder.

Here is another phase of the same question: A party brings to an office a message dated "On Board Steamer Equinox, Portsmouth, O., June 20th, 1873." How much of the above are we bound to transmit free? I would say apply the same rules as in counting extra words after signature, and in the case named, charge for four words in address.

GEO. T. WILLIAMS.

Answer.—A telegraph company is in no sense bound to transmit free any affix or prefix to a signature or date, and only so much in an address as may be necessary to find the party, and then only for reasons of their own, which are evident. Many abuses have crept into the business which it is time to stop, and this is one of them. In the instance given, the four words "On board steamer Equinox" should be charged for as part of the message. There is no good reason why such information should be transmitted free of cost to the sender, nor should his official title, place of business or residence be given at an expense to the company.

COLUMBUS, O., June 21st, 1873.

To the Editor of the Journal of the Telegraph:

How many words should check to the following call for: To A. J. Johnson, H. M. White, or J. Q. Smith, care B. J. Loomis, Cincinnati, O. Where is the steamer Ohio number 4? When will she start on return trip? CHAS. W. ROSS.

Answer.—There are twenty-one words.

W. B. Barrow.—The International alphabet can be found in the JOURNAL of April 1, 1873.

X.—In counting figures in duplication of words, the figures are to be considered as the same in number as the words expressing them. In the sentence "one hundred and thirty-four" there are five words; if duplicated in figures there would be five additional. Figures are to be counted for exactly as many words as may be used in expressing them. We have answered substantially the same question many times during the past few months.

E. S. W.—When a customer sends a message and does not receive a reply as soon as he expects, you are not *obliged* to send an official message requesting an answer. But, at the same time, you are expected to use the greatest politeness and courtesy to the party, making proper explanations discreetly. See our editorial pages, issue of June 2, 1873.

E. O. Wait.—Your paper is plainly addressed to Clinton, Iowa.

H. I.—The number of cells of Hill's battery, requisite to work a line one mile long, depends upon the number and sensitiveness of the receiving instruments employed. The line could be worked with one cell, and might need a dozen.

G. H.—A printing telegraph system allowing double transmission with terminal or way offices, which is simple, practical, and not too costly, would be valuable, and without doubt would be favorably received, even if its speed was limited to 1,400 words per hour, each way. The cores of a magnet are usually made proportional to the length of wire in the coils. When this is the case, and the core is fully saturated with magnetism, nothing in power or strength of attraction would be gained by increasing the surface of the end of the core or using a wider armature.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
July 1, 1873.

To all Offices on W. U. Lines:

State Rates will be adopted by Offices in the following named States:

Between New Hampshire and Georgia - - $2 00

Between Indiana and Cape Breton, Nova Scotia and New Brunswick, - - 2 00

Between Michigan and Cape Breton, Nova Scotia and New Brunswick - - 2 00

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Salt Creek, Ala., changed to Alabama Furnace.

Alameda, Cal., re-opened.

Blue Canon, Cal., re-opened. "Tariff for Other Lines," 60 30 from Sacramento, Cal., or Reno, Nev.

Lincoln, Cal., closed.

Menlo Park, Cal., re-opened as an Other Line Office. "Tariff for Other Lines" 50 25 from San Francisco, Cal.

Mountain View, Cal., re-opened. "Tariff for Other Lines," 50 25 from San Francisco.

New Castle, Cal., re-opened. "Tariff for Other Lines," 50 25 from Sacramento.

Roseville, Cal., re-opened. "Tariff for Other Lines," 30 10 from Sacramento.

Wheatland, Cal., re-opened. "Tariff for Other Lines," 50 25 from Sacramento.

Malad, Idaho, closed.

Concord, Ill., closed.

Garden Plain, Ill., closed.

Lovejoy, Iroquois Co., Ill., changed to Wellington.

Tunnel, Ill., closed.

Houlton, Me., is now a W. Union office. Tariff 25 cents more than Woodstock, N. B. Check direct.

Kingston, Md., closed.

Westover, Md., re-opened.

Business for the following Other Line Offices in Maryland, published in last JOURNAL, may also be sent via Point of Rocks, Md. "Tariff for Other Lines" same as via Washington, D. C.:

Boyds,
Rockville,
Tuscarora,
Silver Springs.

Brooklyn, Mich., closed.

Ocean Grove, N. J., is now a W. Union office; square 47. Check direct.

Business for Old Bridge and Newtown, N. J., will hereafter be checked direct.

Buffalo Plains, N. Y., closed.

Catskill Mountain House, Cornwall, N. Y., re-opened.

Lake George, N. Y., re-opened.

Chittenango Springs, N. Y., re-opened.

Millport, N.Y., is now a W. U. office; square 83, check direct.

Messages for Tottenville, S. I., N. Y., may be taken and delivered from Perth Amboy, N. J.; charges for delivery, twenty-five cents.

Offices in squares 1 to 40, inclusive, and 45 and 46, which have heretofore computed rates to points on Long Island, in squares 29, 33 and 41, by adding fifteen cents to their rate to square 41, will hereafter charge for same points the rate to square 33. The following is a list of the L. I. offices referred to:

Babylon,	Mineola,
Bay Shore,	Northport Depot,
Brentwood,	Penataquit,
Flushing,	River Head,
Greenport,	Sag Harbor,
Hicksville,	Shelter Island,
Huntington Depot,	Glen Cove,
Jamaica,	Roslyn,
Manor,	Oyster Bay,
Mattituck,	East Hampton.

Cresson Springs, Pa., re-opened.

Chester Heights, Pa., re-opened; square 59.

Business for Tacony, Pa., will hereafter be checked direct.

Rocky Point, R. I., re-opened; tariff same as heretofore.

Yellow Sulphur Springs, Va., re-opened.

Montgomery White Sulphur Springs, Va., re-opened.

Hereafter the "Tariff for Other Lines" from Richmond, Va., to points in Virginia, given below, will be as follows:

Alleghany,	40	3	Hanover Junc,,	30	2
Beaver Dam,	30	2	Louisa, C. H.	40	3
Covington,	40	3	Millboro,	40	3
Frederick's Hall,	30	2	Elizabeth Furnace,	40	3
Greenwood,	40	3	Jackson River,	40	3
Hanover, C. H.,	25	2	Keswick,	40	3

NEW OFFICES.

276 Alabama Furnace, Ala.
295 Georgiana, Ala.
294 Ironton, "
304 Planterville, "
553 Divide, Col.
578 Black Rock, Idaho.
318 Hervey City, Ill.
298 Monee, Ill.
310 Omaha, "
329 Sanborn, Ill.
308 Wellington, Ill.
289 Hillsboro, Ind.
356 Gordon's Ferry, Iowa.
356 Waupaton, Iowa.
466 Hartford, Ks.
* Barnsville, Md., 20 1 { 77 Washington, D. C. / 85 Point of Rocks, Md.
148 Rifle Lumber Boom, Mich.
148 Au Gres Lumber Boom, Mich.
342 Stonewall, Miss.
369 St. Paul, Mo.
409 Scotts, Mo.
513 Belvidere, Neb.
516 Georgetown, Neb.
47 Kinkora. N. J.
47 Lewistown, N. J,
83 Crystal Springs, N. Y.
120 Ellicottville, N. Y.
Flatbush, L. I., N. Y., tariff same as Brooklyn.
36 Johnsonville, N. Y.
* Clay Station, N. Y., 25 2 74 Syracuse, N. Y.
213 Buena Vista, O.
131 Everson.
76 Pine Grove, Schuylkill Co., Pa.
112 Sonman, Pa.
47 Torresdale, Pa.
133 Blue Ridge Springs, Va.
511 Palmer, Texas.

Offices having "Special Sheet A" will check Pine Grove, Schuylkill Co., Pa., 25 cents more than "special rate" to Phila. Square rates not to be increased.

Battle Mountain, Ind., in last JOURNAL, should read Battle Ground, and Silver Creek, Md., should read Silver Springs.

ATLANTIC CABLE BUSINESS.

We are informed that on and after July 1, 1873, the rate from London to points given below will be as follows:

	For 20 words or less.
Portugal, via Falmouth....	$2 12
Spain, " "	2 62
Orkney Islands.....	1 50
Shetland "	1 75

Half-rate for each additional 10 or fraction of 10 words.

WILLIAM ORTON, *President.*

WE are pained to announce the loss of three more members of our Association, viz.: Fred. S. Belden, certificate No. 966, died of consumption, at Whitehall, N. Y., June 10th. He was formerly employed at New Carlisle, Ind.—Theodore Wilcox, certificate No. 1029, died at Chicago, of cerebro spinal menengitis, June 16th. He was manager of the Great Western Telegraph office at that point.—Edward Wade, certificate No. 1545, died of cholera, at Nashville, Tenn., June 17th. He was operator at the St. L. & S. E. R.R. office at that place.

Assessments for these deaths will be issued without delay.

To the Editor of the Journal of the Telegraph:

I understand, from the officers of the Insurance Association, that we have three more deaths, and that they all occurred within a week of each other. They have been coming rather often of late, and no doubt many members will feel that they can ill afford the three dollars to be called for. It was to relieve such that the proposition was made to limit the payments in each case to $1,000, it being understood that all money received in excess of that amount should be used for the purpose of liquidating future assessments. I have no doubt, if properly understood, all would heartily approve of the change.

The objection most frequently urged is that it would be unjust to the old members. This class, however, have had the benefit of the Association by being insured during their whole connection with it. This alone has certainly been worth all it has cost them, and under the new plan, should it be put in operation, they would enjoy the same benefit in a degree proportionate to the amount they will be called on to pay.

Surely, for the sake of their financially less fortunate brethren, if for no other reason, the proposition should be approved. One thousand dollars is as much as such an Association as ours should undertake to pay. It is sufficient in most cases to relieve immediate necessities, and if we do this much we have accomplished all that can reasonably be expected.

Again, it is urged that it would be unjust to the old members, because it admits new members to an equal interest in the reserve fund, which has mainly accumulated from the contributions of those who have long been members. This is true, but it can be easily and satisfactorily adjusted by increasing the initiatory fee, which new applicants will hereafter be obliged to pay, in order to be admitted to membership. The reserve fund now amounts to a little over $1 per member. Let the initiation fee be made $2.50 for the present, and as soon as the reserve fund reaches an amount equal to $2 per member, add another dollar to the fee.

The money value of a membership in the Association is certainly worth more to-day, with our six years' standing, and the reserve fund, which is constantly increasing in amount, than it was in the early existence of the Association, when our plan was but an experiment.

It seems no more than just that this fact should be recognized, and new members be required to pay accordingly.

"OLD MEMBER."

OBITUARY.

HORACE F. CLARK.

The Hon. Horace F. Clark, a Director of the Western Union Telegraph Company, died at No. 10 East Twenty-second street, at 11:15 P. M. on Thursday, June 19th, of rheumatism of the heart. About May 1, Mr. Clark started for Chicago to attend the annual election of Directors of the Chicago and North-Western Railroad, in which he held a large interest, and he made an extended tour of inspection over the Pacific Railroad and other lines with which he was actively connected, returning to New York on Saturday, May 31. While absent he was taken with an attack of rheumatism, to which he had long been subject, and on reaching home he was quite unwell. The disease gradually became more alarming, compelling him to abstain from business and finally confining him to his house, which he has been unable to leave since Monday of last week. Having frequently before been affected similarly, and being of a natuarlly strong constitution, earnest hopes were even entertained that he would eventually shake off the hold of the disease and recover his health again. The symptoms continued to grow worse, however, and on Tuesday last the affection assumed an unfavorable turn and struck to his heart, when he began to sink gradually, passing away quietly surrounded by various relatives and friends.

Mr. Clark was born in Southbury, Conn., on Nov. 29, 1815, and was consequently in the 58th year of his age.

At a meeting of the Executive Committee of the Western Union Telegraph Company, held on Saturday, June 21, the following preamble and resolutions were unanimously adopted :

" *Whereas*, It has pleased Him, whose ways are not our ways, to take from his friends and from his labors Mr. Horace F. Clark, and we, who have known him well, desire to record on the pages where his name appears so often an expression of sorrow for his loss, as well as our tribute to his various services ; therefore,

Resolved, That we feel that one who has been so long a leader in the material enterprises of his country, and prominent among the chief men of its chief city, needs no recital of his works or his character ; the trusts he was filling, the position he had won, bear testimony weightier than words to an integrity that never was questioned ; to the mental keenness, power and attainments manifested on so many exacting fields; to that broad grasp of the great undertakings of his time which yet, with rare felicity, was associated with exceeding accuracy and mastery of detail, and to that industry which resulte1 alike in his success and in his death.

Resolved, That we wish rather to record here our sense of his wise counsels and unremitting devotion to the interests of this company, our sorrowful recollection of long and pleasant personal intercourse, and our loss of a friend whose fidelity was positive, and who, when he promised support, never wavered or forgot.

Resolved, That we tender our sympathy to the family of our friend, and that this committee will attend his funeral in a body.

A true copy from the minutes.

GEORGE H. MUMFORD, *Secretary*.

The funeral took place on Sunday, June 22, at 4½ P. M. from the Madison avenue Presbyterian Church, the Rev. Dr. Adams, pastor. Delegations from the Western Union Telegraph Company, and from the Directors of the New York Central and Hudson River Railroad Company were present. The pall bearers were Judge William H. Leonard, William M. Evarts, Charles O'Coner, Chester W. Chapin, Charles M. Rapallo, William Orton, John Q. Jones, Richard Schell, Joseph B. Varnum, William Butler Duncan and E. B. Wesley.

The remains were taken by special train from the Grand Central Depot at 6 P. M. to Woodlawn Cemetery.

FOREIGN TELEGRAPHIC ITEMS

SUBMARINE CABLES.

The following is from the monthly circular of Mr. William Abbott, of the London Stock Exchange :

The past month has been an important one in the history of submarine telegraphy, the shareholders of three Atlantic lines having adopted the proposals of the respective boards of those companies for amalgamation by unanimous votes, excepting in the case of the French Cable Company, where a few speculative holders have combined with a view to break down all efforts for consolidation. Consolidation unquestionably will give to these properties additional strength, and this will be by no means agreeable to those who traffic only in adverse fluctuations. These machinations have, happily for the shareholders and for the future development of telegraphy, however, signally failed. Recent interruptions in cable communication have, no doubt to a partial extent, checked confidence in cable securities, but the successful and speedy repair of the French and Singapore lines at a trifling cost has, however, given great encouragement to the proprietors, and leads to the expectation that equal success will attend the operations of the Telegraph Construction Company in recovering and restoring to perfect insulation the 1865 cable of the Anglo-American Company.

Another important feature of the month has been the picking up and repair of the lost cable between Florida and Cuba. This, with the submersion of the new line, gives a duplicate cable for the valuable traffic of the West Indies.

TELEGRAPHIC PROGRESS IN SAN SALVADOR.

The *Official Gazette* of Salvador, May 17, says :— On account of the frequent breakage of telegraph wires, the failure of the batteries, and want of due care on the part of the telegraph operators and watchmen, the system has not yet got in good working order. Certain regulations and penalties have been decreed by the Government. On telegraphic matters, the Minister of the Interior, in his report to the Constituent Assembly of 1873, says that "telegraphs are now spread over the Republic, and doing much good to the country."

The contractor in constructing lines here failed to comply with the terms of his agreement, putting in smaller wire than contracted for. He has received but $24,000 of the $45,000. His claims will be submitted to arbitration.

TELEGRAPH MATTERS IN CHILE.

At a meeting of the directory of the Transandine Telegraph Company, held at Valparaiso, on the 21st of May, it was stated that the business of the company was steadily increasing, and it would soon be possible to declare a dividend,

It was also stated that the Brazilian and Lisbon cable would be laid and opened as far as St. Vincent, Cape de Verde, in September next, and that the construction of the Pernambuco cable would be completed by May, 1874, so that in about one year Chile will be in telegraphic communication with the world.

THE Eastern Telegraph Company's traffic receipts for the month of May, 1873, amounted to £29,852, against £31,707 in the corresponding period of 1872. The deficiency is owing to the recent interruption in the *Extension* Company's line.

THE Danish Government has granted a concession to the Great Northern Telegraph Company to establish submarine telegraphic communication between West Jutland, or Faroe, and France, and between East Jutland and Sweden.

THE Chamber of Commerce of Christchurch, New Zealand, suggests that " the Government should urge upon the Imperial authorities the desirability of the scientific appliances on board the " Challenger" being employed, whilst in these latitudes, to ascertain the best line for a submarine telegraph cable between this colony and the Australian continent."

BEFORE the Queensland and New Zealand delegates left Sydney, a verbal arrangement was made between them and the representative of New South Wales, at the late Intercolonial Conference, respecting telegraphic communication between New South Wales and New Zealand, and between Queensland and Singapore. It is understood that the arrangement was to the effect that the Governments of New South Wales, Queensland and New Zealand should agree to recommend their respective Parliaments to grant a subsidy to cover the interest on the cost of the submarine cables referred to ; each colony to contribute one-third of the total amount payable under the guarantee.

IT is intended to place the chief inland towns of South Africa in telegraphic communication with Cape Town and Port Elizabeth, and satisfactory progress is being made with the telegraph line to the diamond fields. Tenders have been received for placing the colony in telegraphic communication with Europe, and the Government will shortly submit proposals on the subject to Parliament.

It is stated that there were forwarded from and received at Epsom during the Derby week no fewer than 10,000 telegraphic messages. Of these nearly 3,000 accrued on the Derby day itself, and about 2,500 on the Oaks day. The telegraphing for the press amounted to upward of 35,000 words; while of foreign telegrams more than 150 were sent.

THE receipts of the Submarine Telegraph Company for the month of May, 1873, amount to £9,178. The receipts for the corresponding month of last year amounted to £8,679.

THE cable steamer " Dacia" was expected at Aspinwall Wednesday, June 18, and, after leaving an electrician, would proceed to repair the Jamaica and cables.

THE Telegraph Construction and Maintenance Company's steamer, " Africa," has arrived at Vigo to lay the duplicate line to Falmouth for the Eastern Company, and the steamer " Investigator " has sailed to complete the requisite connections between the various islands of the West Indies.

A SECOND cable from the coast of Cornwall to Spain has been opened for business. This increase in the facilities for the transmission of despatches between England and Spain has led to a reduction of the tariff charges for the transmission of messages.

THE resolutions confirming the terms of the amalgamation of the Anglo-American, French, and New York, Newfoundland and London Cable Companies, have been unanimously passed by the shareholders of the French and Anglo-American companies. They had previously been confirmed by the Newfoundland shareholders.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,
Western Union Telegraph Company,
145 Broadway, New York.

NEW YORK, JULY 1, 1873.

EXERCISE CARE AS TO THE NEW RATES.

The revised rates of the Western Union Company go into effect to-day. Managers should exercise great care in checking and entering messages, in order to avoid the necessity of error sheets. Particular attention should be paid to the checks of messages affected by the changes in the local distance scale. Where there is any doubt as to the amount paid or to be collected, arising from a misunderstanding as to the distance between stations, full information should be given by the check.

SUPPLEMENT TO THE JOURNAL.

It was intended to have issued a supplement with this issue of the JOURNAL, to contain all changes which had taken place in the rates since the last tariff book was issued, in October, 1872, but it was found impossible, at the last moment, to prepare it in time. It will accompany the next number of the JOURNAL.

PRINCETON, COLUSA AND GRAND ISLAND TELEGRAPH COMPANY.

The first section of this line, twenty-five miles in length, connecting with the Western Union at Colusa, Cal., has been completed, and offices established at Princeton, Boggs, Sycamore, Grand Island Mills, Grand Island, and Colusa, Cal. It is the intention to extend the line about two hundred miles further, taking in Mendocino, or Round Valley Reservation, Kanawha, and the settlements down Eel River, Humboldt and Eureka, on Humboldt Bay, a region at present wholly devoid of telegraphic connection with other parts of the country.

Assistant Gen'l Superintendent Ladd, of the Pacific Division, has materially aided the managers of the new line in their enterprise.

Apropos of Minister Schenck's *exposé* of fraud and corruption, comes the official report of the engineers employed to examine the Emma mine, of which Mr. Schenck was a director and trustee, and which he so strongly endorsed, over his official signature as Ambassador of the United States. In the Washington correspondence of the New York *Herald*, June 26, is the following:

Information from one of the engineers employed to examine the famous Emma mine, with which Minister Schenck's name was at one time connected, shows that the mine is a total failure. The British stockholders paid one million sterling, and are now eight hundred and forty thousand pounds minus, and have little or nothing on the mine. This is the official report to the stockholders.

SHALL THE INSURANCE PAYMENTS BE LIMITED?

The movement in favor of limiting the payments by the Telegraphers' Mutual Life Insurance Association to one thousand dollars at each death has made considerable progress, despite the active opposition of almost every one of the older members. There is much to be said on both sides of the question, and, in response to the invitation of the JOURNAL, members are freely communicating their views upon the subject.

The communications we have received respecting this matter are quite numerous, each conveying nearly the same argument on either side, so, as we cannot find space for all, and desiring to slight none, we place before our readers, in our own language, the opinions thus far expressed.

It is urged by those in favor of the limitation that, as a matter of policy, one thousand dollars is as large a sum as an association of this nature should assume to pay; that this amount is ample to afford the relief for which the Association was instituted; that a majority of the members are so situated, pecuniarily, that, under the present system, the tax is becoming onerous, and likely to become more so with the growth of the Association. Further, that those who can afford to meet the frequent assessments which a large membership will undoubtedly entail, can procure a policy in a regular life insurance company at less cost. This statement of the case appears to us to be unanswerable.

The opponents of the movement base their dissent upon the ground that the institution was organized upon the express understanding that the amount to be paid at a death was limited only by the number of members; that the Association, having been, as it were, nursed and brought to its present prosperous condition under this understanding, it would be unjust to the founders of the organization, and to those who subsequently joined with this belief. Also, that the reserve fund which has been accumulated, and on the strength of which it is proposed to initiate the "new departure," having been paid in by the present members, it is not right that new-comers should participate in advantages for which they render no equivalent. To a degree, this last objection possesses force, but it can easily be overcome, and beyond this there is no strength in the position taken. But let us see the exact condition of affairs.

The Association was organized in 1867, purely as a relief society. It had a very humble beginning, and when the amount paid at a death reached five hundred dollars it was deemed a great result. And so it was. There was no thought of profit, only of the amount of good possible to be done by a small contribution from each, which was hardly felt, even by the poorest. The Association has increased so largely that, unless some limit of assessment is made, less than that imposed by one of the by-laws, members with small incomes will be driven out from sheer inability to pay. This, of course, is not desired by any one. Their rights and condition must be respected, and there is but one way to do it, and that is to limit the payments, and thus decrease the amount of assessment. The by-laws confine membership to fifteen hundred. This provision we consider unwise, and advise its repeal. Every telegrapher should be a member, and the assessments should be so adjusted that this should be possible. Then the Association would prove that for which it was instituted, not a support for life or for years, but a present relief for necessity.

SUCCESSFUL LAYING OF THE FOURTH ATLANTIC CABLE.

The steamship "Great Eastern," which commenced laying the fourth Atlantic cable at noon on June 16th, arrived at Heart's Content at eight o'clock P. M. of the 27th, having successfully paid out all the deep sea cable to within eighty miles of that place, when the wire was cut and buoyed at nine o'clock A. M. of that day. Owing to a heavy southwesterly gale, which was blowing at the time, it was deemed imprudent to attempt to pass the cable line to the steamship "Hibernia" for connection with the shore end, which was on board that vessel. The cable will be spliced and run in as soon as the weather moderates.

In the cable just laid three different types of cable are used, each of which embodies features distinct from the others, and which have been suggested by previous experience. These types, known as A, B and C, are the shore ends, the intermediate cables, and the deep sea cable. The shore end is, of course, a very heavy cable, capable of meeting any contingency that might arise from coasting navigation, and extending from three to five miles out, according to circumstances. The intermediate cables are of lighter and slightly varying patterns, and are continued from the shore ends for distances of from 150 to 250 miles, when they are joined by the deep sea cable, which is of a still lighter design. The conductor in each case is a strand of seven copper wires insulated with gutta percha, prepared according to Mr. Willoughby Smith's system, alternating with Chatterton's compound, the cores being covered with a serving of jute yarn steeped in a solution of preservative mixture. The outer covering of the shore ends consists of twelve strands, each formed of three galvanized iron wires, served with yarn, and passed through Clark's compound, which contains silica. This is whipped with a fine strand of jute, and again passed through the compound. In another type of shore end the served core is closed with twelve wires, and finished as in the previous case. The intermediate types are similarly constructed, the difference being in the size of the wire which forms the outer covering. The deep sea cable has its core closed with ten strands of wire and hemp, each strand being passed through Clark's compound. The cable has a whipping of jute yarn, and has been passed through Clark's compound. The metallic portions of the cable are thus efficiently protected, in proof of which it may be mentioned that portions of cable thus made have been recovered after three years' immersion in the Atlantic, and have been found to be as perfect as when they left the factory. The core of the new cable having been originally intended for a longer route than that now decided upon, was made of a heavier section than it otherwise would have been, so that it possesses a very high speaking capacity.

The new cable follows a course to the north of the route over which the line of 1865 was laid, and it does not approach the latter nearer than thirty

Digitized by Google

miles, except at the shore ends at Valentia and Heart's Content. The length of the new line is about the same as that of the cable of 1865—nineteen hundred miles. As soon as the cable is completed to the shore the "Hibernia," "Edinburgh" and "Robert Lowe," which accompanied the "Great Eastern" across the Atlantic, will lay the two Sydney cables, after which the "Hibernia" will fill up with coal and join the "Great Eastern" at Heart's Content. The two will then proceed eastward along the course of the 1865 cable to the point of rupture, which is 568 miles from Valentia, where it will be grappled for, and, it is to be hoped, found and repaired. On leaving Sydney the "Robert Lowe" will proceed to repair the Duxbury section of the French Atlantic Cable, which was broken last month close in shore. She will also effect some repairs in the cables belonging to the Newfoundland Telegraph Company. The "Edinburgh," when her task has been completed, will fill up with coal and return to the Thames to ship a portion of the Brazilian cable, the greater part of which it is intended to lay during the present year.

LETTER FROM MINISTER SCHENCK, RELATIVE TO ALLEGED OVERCHARGES IN CONNECTION WITH CABLE BUSINESS.

LEGATION OF THE UNITED STATES,
LONDON, April 13, 1873.

SIR: I have been thinking for some time of writing to you in relation to the charges made on telegrams sent to the United States by the Anglo-American Telegraph Company. That company have an arrangement with the Western Union Telegraph Company, in our country, through which a systematic imposition is practised, which ought to be exposed. I bring it to your attention because communications transmitted by ocean cable on Government business are subjected to the same overcharges as are the messages of individuals, and the public and private persons are equally concerned in having what is done known, with a view to some correction of the wrong. I discovered something of what I am about to explain three or four months ago, and since then have been making inquiries which have elicited the following, as I believe a true statement of the case:

These two companies have some contract between them by which it is agreed and arranged that messages sent from England by the Anglo-American to all points in the United States shall be received and transmitted by the Western Union to their destinations. Thus the interior or land lines of the latter company are made continuations of the cable on the American side of the Atlantic. This is proper enough, and a convenience to every one as well as to the contracting parties. It gives to the Western Union a monopoly of business coming through the cable to America, and naturally for that monopoly they agree to pay something. Accordingly the contract binds the Western Union to allow the Anglo-American to retain a certain portion—being, I believe, one-third of what is charged for transmission over the wires in the United States.

The Anglo-American Company have a tariff of prices. The charge for a message from London to New York, or points east of New York, is four shillings (English money) per word. After this month it is understood they have promised a reduction to three shillings a word.

The Western Union Company have also a tariff of prices. The charge now is, from New York to Washington, for the first ten words forty cents, and three cents for each succeeding word; from New York to Chicago, for the first ten words $1, and seven cents for each word beyond ten; from New York to San Francisco, $2.50 for ten words, and seventeen cents for each word beyond ten, and so in proportion to other points.

Every word sent by the cable is charged for, including date, address and signature. On the land lines of the Western Union within the United States there is no charge made for date, address and signature. But now observe the practice, under the contract before referred to, between the British and American companies. A message is sent by the cable from London to Washington, Chicago or San Francisco. The office here demands and collects for each word four shillings, which pays for transmission to New York, and also three pence more for each word to Washington, nine pence more for each word to Chicago, and fifteen pence more for each word to San Francisco. This, with exchange and the present difference between gold and United States currency, is, for that part of the service which lies beyond New York, more than double the proper charge of the Western Union Company, and is so far an overcharge, to be divided between the companies who are the parties to it.

When the charges imposed for transmission over the wires west of New York are double the regular tariff prices, the American Company can well afford to allow the cable company one-third of the receipts for that portion of the service performed by their lines.

If the charge were only double, the account would stand thus: The Western Union being credited $2, when the proper amount to be collected from them was but $1, they would leave sixty-six and two-third cents with the British Company, and yet receive $1.33⅓ for their share, being thirty-three and one-third cents in excess of their regular and legitimate charge at home. But the case is, in some particulars, much worse than this. Let us illustrate, by supposing a message of 100 words sent from London to Washington. Ten of these words may be supposed to constitute the date, address and names. The cable company would require to be paid here, for the transmission over the land line between New York and Washington, three pence on each of the whole 100 words. This would amount to £1 5s., which is equal to $6.96. But the regular published charge for such message by the Western Union would be, for the date, address, names—ten words—nothing; for the first ten words, forty cents; for the remaining eighty words, at three cents, $2.40; 100 words $2.80. Thus, there would be extorted for the service in the United States an overcharge, equivalent in currency to $4.16, and the $6.96 being divided, would give the British Company the equivalent of $2.32, and leave the American Company, for their share, $4.64, which is still $1.84 beyond their legitimate charge at home.

In the case of short messages, where the address, date and names bear a larger proportion to the text, the proportional overcharge would be greater. For a message, for instance, of twenty words, there would be collected here, for the line from New York to Washington, five shillings—equal to $1.39 in United States currency, instead of forty cents, which would be the charge at home. In such a case, the Western Union pocket, for their share, for services performed by them, ninety-three cents, being much more than twice their whole proper charge. And it must be remembered, that a large proportion of telegrams sent across the ocean have a text of but ten words or less.

This may seem dealing with an inconsiderable matter, but considered in the aggregate, and computing the percentage of unjustifiable charges, it is no small thing, as affecting the cost of sending intelligence between the two countries. So far as the Government of the United States is concerned, it must have made a large difference during the past year.

I have no means of knowing whether messages coming from Washington or other points in the United States, to be transmitted by the cable to England, are subjected to the same or similar overcharges, or not. My calculations are based on 109 for exchange and 115 for gold, which has been for some time a fair average.

I submit this exposure to you for such use as you may deem it proper to make of the information.

I have the honor to be, sir, very respectfully,

Your obedient servant,
ROBERT C. SCHENCK.

To Hon. HAMILTON FISH,
Secretary of State,
Washington, D. C.

MINISTER SCHENCK'S MISREPRESENTATIONS REFUTED BY MR. ORTON.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
NEW YORK, *June* 21, 1873.

Sir: I have had the honor to receive your communication of the 11th instant, replying to mine of the 10th, concerning the letter of General Robert C. Schenck, United States Minister to England, published in the *New York Herald* of Sunday, June 8th, instant, and which you inform me is substantially a correct copy.

It appears, therefore, that the Minister of the United States in London has addressed an official letter to the Department of State, in which grave charges are made affecting the reputation for honorable dealing of certain citizens of the United States. A copy of these charges was, as you inform me, transmitted to the Post-office Department, and by the latter was given to the press for publication. It does not appear that any effort was made, either by the State or Post-office Department, to ascertain if the charges were true, and therefore it may be fairly inferred that they were assumed to be true by the officials of both departments, who appear to have also assumed that the correction of the abuses alleged would be secured by making them public.

The charges made by General Schenck which concern the managers of the Western Union Telegraph Company, are these:

1. That the Anglo-American Telegraph Company, which controls the submarine cables in operation between Europe and America, "have an arrangement with the Western Union Telegraph Company *through which a systematic imposition is practiced which ought to be exposed*," which arrangement "binds the Western Union" to allow the cable companies to retain "one-third of what is charged" for the transmission of cable messages over the land lines in the United States.

2. That, under this arrangement, the charges for the transmission of cable messages over the wires, beyond New York, are double the regular tariff prices charged on domestic messages, "an overcharge to be divided between the companies who are parties to it," and that "the Western Union *pocket*, for their share, much more than twice their whole proper charge."

3. That "communications transmitted by ocean cable on Government business are subject to the same overcharges as are the messages of individuals."

To these charges I respectfully submit the following reply:

Digitized by Google

1. It is true that the Western Union Company have made an arrangement with the companies controlling the Atlantic cables, for connection and for the mutual exchange of business, which, as General Schenck says, "is proper enough, and a convenience to every one, as well as to the contracting parties."

2. But it is not true that this arrangement "binds the Western Union Company" to allow the cable companies to retain one-third, or any other share, of what is charged for the transmission of cable messages over the land lines in the United States, nor that the charges for such transmission are in excess of the average charges for other telegraphic messages.

The facts are these: The cable business is controlled by the cable companies, who fix the rates to be charged and make and modify the rules governing its conduct. The Western Union Company have agreed to apply these rates and rules to cable messages in the United States, whether received from or transmitted to the cables, and to accept certain fixed rates per word as their compensation for all services connected with the transmission of such messages, including the keeping, proper accounts, and collecting and paying over the moneys accruing therefrom.

There are more than 6,000 telegraph stations in the United States, and it being impracticable to supply European offices with a tariff to each of such stations, this country is divided into four districts, for each of which a uniform rate is established. The cable rate of one dollar per word between England and New York includes eight cents a word payable to the Western Union Telegraph Company for their part of the service. The rates beyond New York are:

For all stations in New Jersey, Pensylvania, Delaware, Maryland and District of Columbia ..... 3 cents a word.
For all other territory east of the Mississippi River, including the city of St. Louis ..... 15 cents a word.
For all other stations in the United States west of the Mississippi River ... 20 cents a word.

The rates to points on the Pacific coast have been slightly reduced since the date of Gen'l Schenck's letter.

Under the rules of the Western Union Company the message rate in the United States is for a minimum of ten words, with a rate per word for additional words above ten; but the rules of the cable companies permit any number of words to be sent at the word rate, and the result is that a majority of the cable messages contain less than ten words, those of three, four and five words being common, and occasionally a message is offered containing only two words. The Western Union Company charges one dollar for ten words or less between Chicago and New York. The majority of cable messages from Chicago contain less than ten words, the average for an entire month having been as low as six words.

In the case of St. Louis and St. Paul the rate on domestic messages to New York is $1.50 for ten words or less, while the cable rate is fifteen cents a word. But between New York, New Orleans and Mobile the local rate is $2.00 for ten words or—never less and sometimes more than—twenty cents a word, while the rate on cable messages is only fifteen cents a word. The result is, that on cable messages the Western Union Company actually receive only the average of their local rates, while they are obliged to transmit cable messages of three words from New Orleans and St. Louis to New York for forty-five cents, or from San Francisco and Oregon for sixty cents. Such messages are handled at considerable loss, and if charged by Western Union rules would be treated as containing ten words. Concerning the rates collected in England, or other portions of Europe, for messages to stations in the United States the Western Union Company have no voice, and in respect to many of them have had no knowledge until prompted to inquire by the published charges made by Gen. Schenck.

The Western Union Company agree to perform specific services for a fixed compensation, all of which they receive, and no part of which is, in any manner, divided, refunded, or otherwise paid as a consideration for having the cable business given exclusively to them. They are no more responsible for the tolls charged on cable messages in Europe than a railway company in the United States would be for the freight charged at Liverpool on merchandise destined for Chicago or San Francisco, which should include the charges payable to the railway company.

3. It is also untrue that "communications transmitted by ocean cable on Government business are subjected to the same overcharges as are the messages of individuals," or to any overcharges whatever; as will clearly appear by the following statement, which can be verified by a reference to the vouchers in the State Department:

The tariff on cable messages from London to Washington, paid in London, is four shillings and three pence a word. When paid in Washington the charge is $1.03 a word. But although there is no obligation on the part of the cable companies to transmit messages "on Government business" at less rates than for individuals, such messages are transmitted *at half rates between London and New York*. Instead, therefore, of the rate of four shillings and three pence a word, London to Washington, the State Department pays only two shillings and three pence, and from Washington to London fifty-three cents a word, instead of $1.03.

Gen. Schenck's zeal and efficiency in exposing "systematic imposition" upon the public, as sometimes practiced by the promoters and managers of swindling corporations, are widely known and fully appreciated, especially in England. But he could not have been aware, when he attached his official signature to erroneous charges, which probably he did not prepare, nor even carefully examine, that his reputation and office were being used by the active and unscrupulous agents of an opposition cable scheme. Yet such is evidently the fact. I submit, however, whether it is a part of the official duty of the American Minister at London either to seek to relieve the people of England from what he is pleased to style the "systematic imposition" of an English corporation, whose conduct is satisfactory to the British public and Government, or to arraign citizens of the United States before our Government and people upon charges concerning the conduct of their private business, which, although absolutely groundless, are certain to prove injurious.

To the success of the great enterprises in which the cable companies and the Western Union Company are engaged, the United States Government has not contributed one dollar. More than this, it has refused, in at least one instance, to pay for official messages exchanged with a foreign Government, until its obligation to do so was affirmed by the decision of a Federal Court. It would seem not unreasonable, then, that these companies, whose capital and enterprise have connected the United States with the telegraphic systems which are rapidly encircling the globe, if not entitled to receive special favors from our Government, should at least be exempt from the open hostility of its officials.

It seems unfair for a representative of the United States at a foreign Government to lend a willing ear and the influence of his office to the scheme of those who have no other interest in the business than the hope that something may be made out of it. But it seems still more unfair that the official charges reported by this representative to his Government should be by the latter given to the public, with an implied endorsement of their accuracy, without notice to the parties charged, and without inquiry as to the truth of the allegations.

I have the honor to be,
Very respectfully,
Your obedient servant,
WILLIAM ORTON,
President.

To HON. HAMILTON FISH,
Secretary of State.
WASHINGTON, D. C.

IMPROVEMENTS IN TELEGRAPHIC INSTRUMENTS.

The Elizabeth, N. J., *Daily Advertiser and Journal*, of the 13th ult., says:

Through the courtesy of Mr. C. D. Tull, of the Superintendent's and Engineer's Office, Central Railroad, we were shown a few days ago some unusually fine telegraphic instruments forwarded to him by A. G. Davis, Superintendent of Telegraph of the Baltimore and Ohio Railroad. The principal features of these instruments, aside from the fine setting and workmanship, are the improvements on the instruments in ordinary use, and the economy in size, the same effects being produced by relays and sounders about half as large as those in common use. The first of these improvements is a patent wire connection. In all the instruments now in use the connection is made by passing the wire through a small hole in a post provided for that purpose, and then fastening it my means of a screw, the end of which presses down upon the wire. It is not impossible that with this screw the connection might be but partially made, or even not made at all. With the new instrument it is made by means of a metallic button which screws firmly down on the wire which is wound round a threaded post, thus being sure to make a complete connection at some point of the wire, with no possibility of breaking it.

Another improvement is in covering what is known as the "main wire" in the relays with a gutta-percha tube, thus completely protecting it while the relays are being cleaned. The adjusting spring which moves the magnet backward or forward is substituted by a double screw which adjusts the magnet and then it holds it firmly in its place. The keys, too, are furnished with a decided improvement in what is known as the circuit breaker. This is a small spring which, in closing the circuit, presses upon a metallic button, one face of which is slightly oval. The spring, even if the circuit breaker be but slightly pressed toward the key, will touch some portion of the button and thus complete the circuit. There are other slight alterations for the better in various parts of the instruments, and the manner in which they are fitted up is far superior to anything yet exhibited in the manufacture of telegraphic instruments. The metal portions of them are nickel plated, and the bases are black walnut, inlaid with the finest French walnut. They are about half the size of ordinary instruments, and are superior in every way. They are manufactured by Watts &

Digitized by Google

Co., of Baltimore, and it is possible that the Central Railroad Company will in time adopt them in place of the ones now in use, as the difference in the price is by no means commensurate with the advantages.

SOUNDINGS FOR A CABLE BETWEEN THE UNITED STATES AND JAPAN.

The United States steamship "Tuscarora," Commander George E. Belknap, now at San Francisco, is being fitted to make deep-sea soundings in the Pacific for a cable route between the United States and Japan, this authority having been granted by the last Congress. The sounding apparatus made for the Juniata has been sent to San Francisco, together with fifteen miles of carbolized sounding line; thirty miles of steel wire, and one of Thomson's sounding apparatus have also been ordered. The vessel will be ready to sail early in July, and will proceed toward Puget Sound, thence to the Aleutian Islands, and stop at Yokohama.

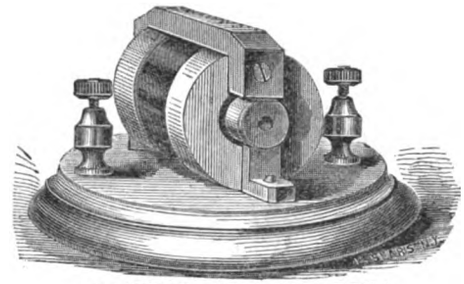
CUBAN CENSORSHIP OF NEWS TELEGRAPHIC DESPATCHES.—PROTEST TO THE HOME GOVERNMENT.

Despatches received by steamer from Havana at Key West, June 16, state that the censorship over news despatches transmitted to Cuba by the cable is maintained with unremitting severity. Despatches from New York to the Havana press were suppressed last week, and there is great complaint. The leading Republicans have sent a telegram to the Government of Madrid, remonstrating against the arbitrary conduct of the local authorities, and demanding a speedy modification, if not abolition of the rules of censorship, the rigid enforcement of which they declare to be unnecessary and intolerable.

A favorable reply is expected from the Spanish home Government.

SCIENTIFIC PRIZES.

Among the prizes awarded by the *Société d'Encouragement pour l'Industrie Nationale* of Paris for 1873, is the following:



Economic arts.—Prize of $600 for an apparatus giving an electric current, constant in direction and intensity, whose electro-motive force and conductibility shall be comparable to those of a nitric acid battery of sixty to eighty ordinary sized elements, and showing superiority in economy or salubrity over the machines now in use; the prize was awarded to M. Gramme for his magneto-electric machine.

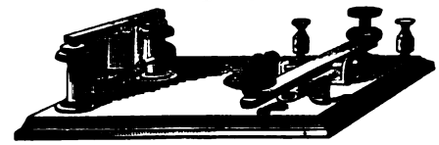
ELECTRICAL GAS LIGHTING.—A novel device for lighting gas by electricity, lately patented, is made as follows: A glass cup is immersed in liquid; and when the gas is turned on it enters under the cup and lifts the same, thereby establishing connection with a battery which heats a platinum wire placed over the burner, and thus ignites the gas. Mueller and Meier, of Hanover, Germany, are the inventors.

EXPERIMENT IN ELECTRO-DYNAMICS.—MM. Planté and Niaudot-Breguet.—If a secondary couple (of lead plates) be charged with a Gramme magneto-electric machine, and then be left undischarged in connection with the machine which has been stopped, the latter presently begins to turn under the influence of the current from the secondary couple in the same direction as it was turned in charging, and continues turning (more slowly, indeed, yet at a considerable rate) for two or three minutes till the couple is discharged. In this restitution there is, probably, only slight loss. That the machine, in its motion, should turn in the same direction as before seems paradoxical, but may be explained by the laws of currents. Further, the secondary couple once charged gives a current more powerful than that produced by the machine which it puts in motion, the difference of intensities continuing the motion.

SOMETHING NEW.

"The Rattler" Telegraph Sounder.

(PATENT APPLIED FOR.)



This is a very simple and effective Instrument, and, as it does not require any spring to draw the lever back, is always adjusted.

PRICE, - - - - $3.50.

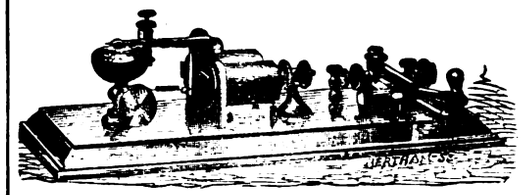
MANUFACTURERS OF

Electrical and Telegraph Instruments



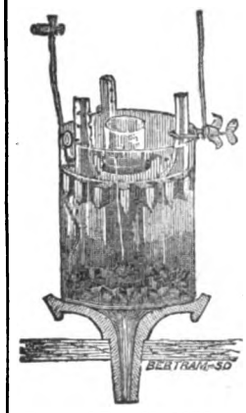
AND

MATERIAL OF EVERY DESCRIPTION,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc.

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER.



ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

SOLE MANUFACTURERS OF THE

NEW PATENT BALTIMORE BATTERY

MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7½ inches.
Specially adapted to Railroad Signals, Printing Instruments etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country having proven the cheapest, and least trouble to maintain of any in the market.

Patented Dec. 31, 1872.

ALSO, SOLE MANUFACTURERS OF THE

Patent Circuit Closer Key,

O'Sullivan Self-closing Key,

Scott's Patent Hotel Annunciator

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE

PATENT BATTERY INSULATOR

shown, holdin a cup of the Baltimore Battery in the above cut, which most effectually insulates the Battery as the drip passes off *thr ugh a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. PRESCOTT, says of it:—"I think your Battery Insulator a very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.

Repairers' Tools constantly on hand.

Importers and Dealers in best English and American Galvanized Wire.

MANIFOLD PAPER, for Train Orders, etc. Also, AGATE PENS.

In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices

THE LECLANCHE BATTERY CO.

Offer for Sale this celebrated Battery,

SECURED BY LETTERS PATENT,

Of which they are the exclusive owners in this country.

Over 300,000 are now in use in Europe,

and have recently been adopted by the French Government in preference to the Calland, which had been used by them for several years.

WE RECOMMEND THEM FOR

Telegraphy (open circuit), Railroad Signals, Hotel Annunciators, Burglar Alarms, Electric Bells, Clocks, &c.

AMONG ITS NUMEROUS ADVANTAGES ARE—

ABSENCE OF ACIDS AND SALTS OF COPPER,

ITS GREAT CLEANLINESS,

WONDERFUL DURABILITY,

ECONOMY IN RUNNING EXPENSES,

ENTIRE ABSENCE OF ODOR.

This Battery will last without any attention from six months to three years.

A large number of Cups are already in use in this country on Burglar Alarms, Electric Bells, &c., and are giving entire satisfaction. The Western Union has a number of Cups put up November 26th, 1872, that are still running.

For further particulars apply to

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 16. NEW YORK, JULY 15, 1873. WHOLE NO. 137.

STEARNS'S DUPLEX TELEGRAPH.

The following diagram (figure 1) represents the arrangement of Stearns's Duplex Telegraph for a terminal office. The whole lines represent the main wires, and the broken lines the local wires. *K*, *K'*, are keys in a local circuit which operates the transmitter *T*, *L*, *L'*, are local batteries. *M* is a main battery *G*, ground. *S*, common Morse sounder. *Rh*, rheostat. *C*, condenser. *R*, duplex relay. *t*, *t'*, are binding posts connected with the adjustable resistance coils. *r*, *r'*, are the terminals of small resistance coils used for maintaining an equal resistance when line is to earth through battery, or to earth direct. The connections of the wires with the various parts will be readily traced. The plugs in the resistance coils must be removed, until the resistance of the coils equals the resistance of the line. When they are equal the armature of the relay will not be affected by the working of the transmitting sounder. The object of the condenser is to receive a charge from the main battery equal to that entering the line, which charge being returned through the relay coil, connected with the rheostat, at the same time that the line returns its charge through the other coil neutralizes its effect upon the armature.

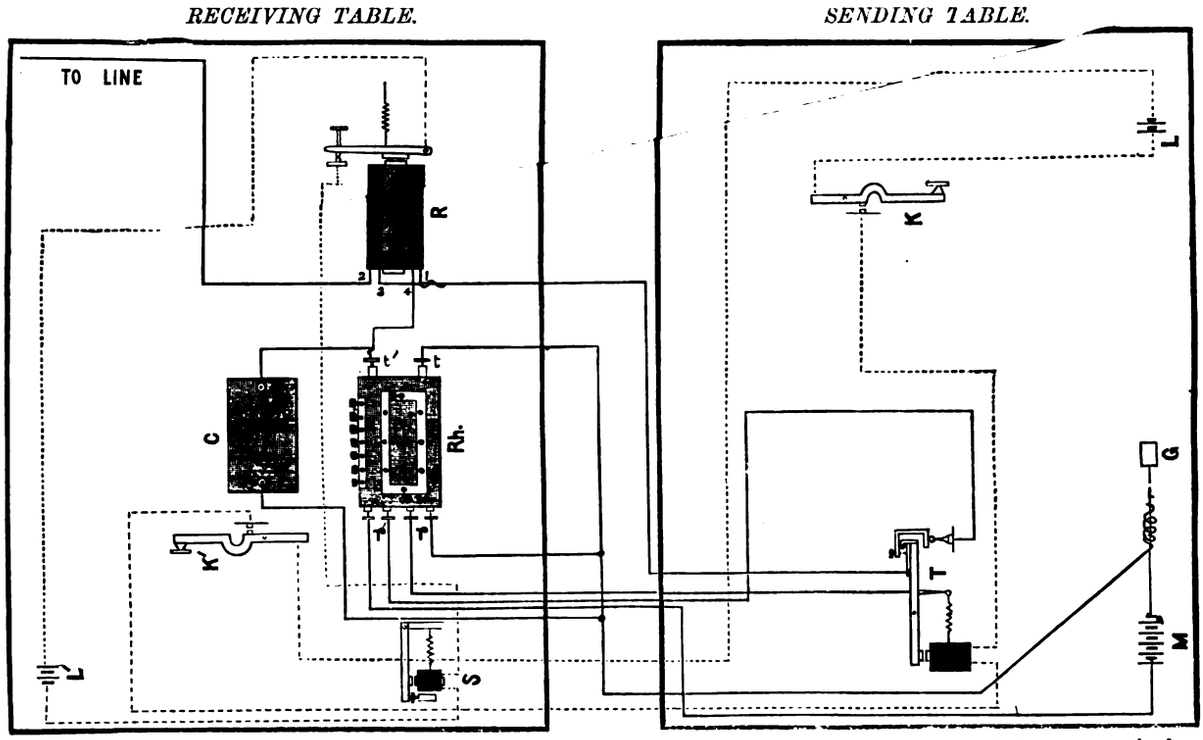

Figure 1..

The small resistance coils represented in figure 1 as being enclosed in the box containing rheostat *Rh* at *r* and *r'*, are generally enclosed in separate boxes.

Figure 2 illustrates the method devised for regulating the condenser charge by means of the rheostat.

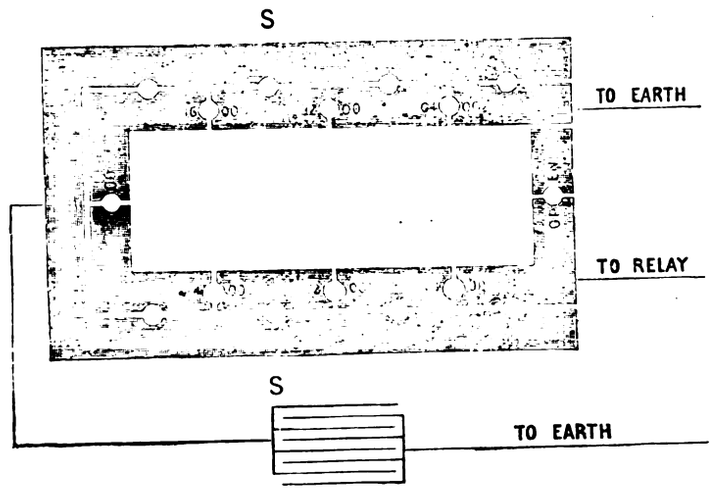

Figure 2.

Strips of brass are placed upon the top of the rheostat for the purpose of affording a means of adjusting or regulating the effect of the condenser charge upon the relay, when the condenser has a static capacity greater than that of the line wire.

For the purpose of explanation, let us suppose the rheostat composed of a number of equal resistances, say 1,000 ohms each (figure 3), and the static capacity of the line be 4 micro-farads, and that of the condenser to be 8 micro-farads. If the condenser wire be connected, as is usual, at *a*, or between the relay and the rheostat, it will receive a high charge from the battery, and when the battery is removed will return the whole, or nearly the whole, of the charge through the relay to the earth, and the charge being greater than that returned from the line will overbalance the latter and produce a movement of the armature. If the condenser wire be connected at any other point, as, for example, between the coils *b* and *c*, it will not receive so high a charge from the battery as it would if connected at *a*, and this smaller charge upon returning will divide, a portion only of it passing in the direction of the arrow *g* through coil *e* and the relay to the earth; the other portion of the charge passing through the coils *c* and *d* in the direction of the arrow *h* to the earth. Again, if the condenser wire be connected at *e*, or between the rheostat and the earth, it will receive no charge at all from the battery, and of course can return none.

Thus it will be seen, that by connecting the condenser at different points between the coils of the rheostat, any required proportion of the charge can be sent through the relay.

The rheostat is arranged substantially as shown in Figure 2.

The strip *S* furnishes a means of connecting the condenser between any two coils of the rheostat, and thus regulating the quantity of charge which shall flow from the condenser through the relay with sufficient exactness.

In making up the resistance necessary to balance the line in any case, as many as possible of the *low* numbers should be used, so that these low resistances, or any of them, may be interposed between the relay and the point where the condenser is connected.

The accompanying diagram (Figure 4) represents the plan adopted by the Western Union Telegraph Company for connecting the wires with the duplex instruments, so connecting that the same desks, and, as far as practicable, the same instruments may be used for working either the duplex or ordinary Morse system. To accomplish this, all that is necessary, in addition to the duplex set, is one common

Digitized by Google

relay, two keys, and three "three-point switches." This forms an equipment for two desks, which may be used either as the sending and receiving desk for a wire worked by the duplex system, or for two wires worked by the Morse system, as may be desired.

The two desks are represented in the diagram, the one on the right being used as the receiving desk, and the one on the left as the sending desk, when the duplex system is in operation. *R* is a common Morse relay. *R'*, a differential duplex relay. *S* is a common sounder. *S'*, a duplex sending sounder. *Rh* is a rheostat. The three-point switches are shown near the bottom of the drawing.

When it is desired to work the duplex system, the three switches are each turned to the left. When the desks are to be used for two wires worked by the Morse system, the switches are turned to the right.

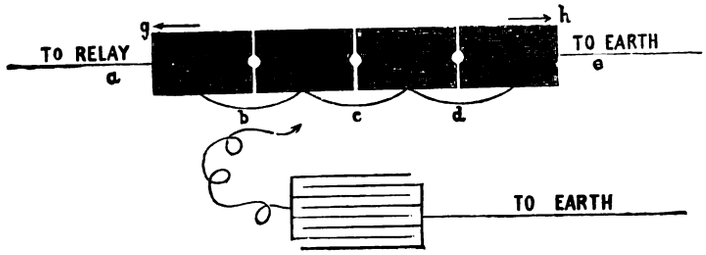

Figure 3.

ÆRIAL TELEGRAPH CABLES.

One of the things which attract the attention of a New Yorker visiting London is the telegraph cable stretched over the roofs of the houses in many directions. There are few of the single wires which are so common in New York, and none of those street nuisances, the telegraph poles. Many wires are packed together with insulating material, and thus formed into a cable; but as the wires are slender (and presumably of copper), and the insulating material is soft, the cable requires support at short distances. To this end a steel sustaining wire is first put up, and from this the cable is suspended.

DUPLEX SENDING DESK. *DUPLEX RECEIVING DESK.*

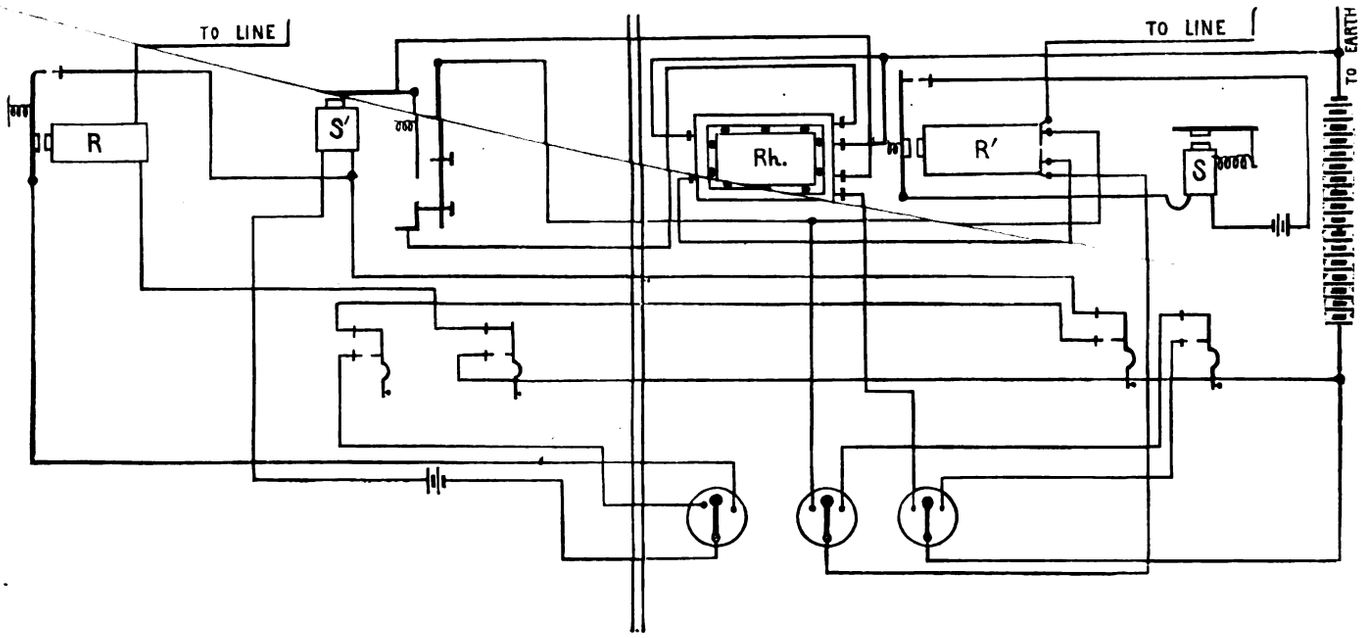

Figure 4.

ELECTRICAL TRANSMISSION BY CABLES.

As the first application of current to a cable is to charge it, it is evident that, before any employable electricity can issue from the further end, the corresponding charge must be completed. We may, therefore, assume that the time required by a wave to charge a cable, and the retardation on the time required for a wave passing from one end to the other to reach a given amplitude, are identical. Mr. Varley is of opinion that the electric current commences flowing out of one end of a cable at the very instant that contact is made with the battery at the other end, but that it is a considerable time before it reaches an appreciable strength; that it then goes on augmenting in strength, never absolutely attaining its maximum force. This may be so; but whatever the nature of electricity may be, it is difficult to imagine the total absence of inertia to its propagation. It is more probable that the velocity of electricity is the same in all conductors, whether submarine or overhead, or in any other form, and that it is very great, but that the resistance and induction of the circuit combine to prevent the wave reaching an appreciable strength for some time after it has commenced to flow out. This is a question, however, which can never be settled experimentally, because we can only recognize the issuing wave after it has attained strength enough to perform some mechanical effect.—*Robert Sabine, in the Telegraphic Journal.*

ELECTRICAL APPARATUS.

Letters Patent have been awarded to Mr. Stanley, of Holborn, for improvements in electrical apparatus, stated in the specification to consist in the construction of the class of electric batteries which generate dynamic electricity so as to render them more portable, by making the cell (jar or bottle) which contains the voltaic couple of about double the internal length of the active portion of the plates, which will be generally of zinc and carbon. The plates, if they extend beyond the half the interior, must be insulated from action of the exciting fluid, or they may be half length, and be fixed either in the top or the bottom of the cell. The purpose is that the battery may be turned upside down, and in such position there will be no electrical action, as the fluid (or fluids in case of an inner pot) will not then touch the plates. The batteries are sealed over with some elastic substance, in such a manner that the fluid cannot escape. Within the sealing is a valve, so fixed that the internal gases may escape at less pressure than would break the cell or the sealing; this valve consists of a tube with a piece of sheet india-rubber tied over it as an air-pump valve; the novelty being the application of this valve to a sealed battery cell. A further arrangement is provided for connection of batteries with apparatus to form a portable bell. For this a box is divided into two parts, one to contain the battery, which is closed, and the other to contain the electrical bell and a roller to roll up the conducting wires with touch. This part has a door, which closes the apparatus when out of use, and a handle above for carrying the whole. Mr. Stanley claims as novelties a long cell, half active; a sealed cell, with a peculiar valve; a water-tight cap for cells; a closed receptacle, with solid terminals for cells; a bell rendered portable; a portable coil, set in motion by reversing the apparatus; and a double receptacle for battery—the last three being novelties as instances of application of the previous parts.—*Telegraphic Journal.*

REMARKABLE ELECTRICAL PROPERTY OF GLYCERINE.—Prof. Waltenhofen finds that when a card is coated with glycerine on one side, and points connected with conductors leading to the coatings of a Leyden jar, or the terminals of a Ruhmkorff coil, are placed in contact with opposite sides, but not exactly opposite each other, the positive in contact with the coated side, the perforation by the discharge will invariably be opposite the positive point instead of the negative, as in Lullin's experiment.

ON THE EFFECTS PRODUCED BY ELECTRIC CURRENTS ON MERCURY IMMERSED IN DIFFERENT SOLUTIONS.

By M. TH. Du Moncel.

Mr. Hughes has shown that if we immerse in ordinary water some drops of mercury, this metal dilates under the influence of the passage of the electric current, when the circuit is formed by the intervention of a stratum of water. I have made some experiments of this character, and I append the results. If we study the movements of mercury in solutions of several natures, we perceive that the direction of impulsion* varies according to the quantity of gas which is disengaged at one or other of the electrodes, and the movement is effected toward the electrode which disengages the least. Also, with ordinary water the movement is towards the positive pole. With solutions of sulphate of copper, sulphate of iron, bichromate of potash, sulphate of mercury, &c., in which hydrogen is largely absorbed in the reduction of the salt, the movement is effected towards the negative pole. Nevertheless, the more or less perfect conductibility of the solution takes part in the phenomena, and we can test this by taking rain water, spring water, and water acidulated with sulphuric acid. With the two first liquids motion is effected in the same direction, but it is more charactised in one case than the other, by reason of the differences in intensity of the electric current traversing them. With the acidulated solution the movement becomes imperceptible, and often in a contrary direction to that which obtained with pure water, because the disengagement of gas at the two electrodes was effected in nearly the same proportion. If we employ solutions capable of disengaging at the positive pole a gas susceptible of energetic combination with hydrogen, when in the nascent state, as occurs with solutions of chloride of sodium, cyanide of potassium, furnishing chloride and cyanogen at the positive electrode, the effects, as to the movements of the mercury, are rather capricious, and manifest themselves generally (after the mercury has constituted for some instants the negative electrode) in a direction similar to that produced with water. Also, if we pass, during a short time, the current from a battery of eight Chutaux elements through a solution of chloride of sodium, at the centre of which we immerse a drop of mercury put into connection with the negative pole of the battery, and if, having broken this circuit, we plunge into the mercury the positive electrode at which the chlorine is disengaged, an abundant liberation of gas, even more energetic than that which resulted from the action of the battery, is produced at the point of contact of the electrode with the mercury, and during a comparatively long time. If, during this liberation, we plunge the negative electrode into the salt water, the surface of the mercury is immediately covered with a yellow pellicule, which passes rapidly to black, and which appears to be the sub-oxide or protoxide of mercury; but as soon as this film is formed the disengagement of gas ceases, and it is only when the negative electrode is withdrawn, and some instants after the pellicule has disappeared, that the disengagement of gas recommences. This circumstance would lead us to suppose that the gas disengaged is hydrogen, which at the moment of the formation of the sub-oxide is employed in the reduction of the oxide. But what is more curious is, that the phenomena is not produced under two conditions: (1) when the platinum wire has been freed for some instants from the chlorine, or has been wiped; (2) when the mercury has served as the negative electrode, and has been able to condense a sufficiently large quantity of hydrogen gas to furnish a secondary electric action, as in Planté's secondary battery. This condensation is visible to the eye, for at first, when the mercury constitutes the negative electrode, no bubbles of gas appear; it is only later that they appear. This phenomena, apart from the rest, has nothing extraordiuary, if we consider that palladium and nickel can condense considerable masses of hydrogen, and that M. Favre has formed a battery of copper and palladium with condensed hydrogen, in which the gas plays the part of the positive metal. If this manner of interpreting the phenomena be true, the positive electrode put in contact with the mercury after the removal of the negative electrode, should constitute a local gaseous couple (chlorine and hydrogen), which, determining at the contact of the two metals the formation of hydrochloric acid, developes, by the action of this acid, a new electro-motive force in the same direction as that of the gaseous couple, and, consequently, an energetic local current, in which the mercury is negative and disengages hydrogen But, as a fresh disengagement of chlorine results from this local current, it continues for some time. Thus much is certain, that when the mercury has served as a negative electrode for some instants, and we then leave it, it disengages bubbles of gas for some time, diminishes in volume, and ultimately resumes its hemispherical shape. The same effects are exactly reproduced with cyanide of potassium (white and yellow), commercial potash, and even with chloride of ammonium. With the last salt, we reproduce in an interesting manner the curious effect of ammonium alloy. When the solutions are slightly fouled by the residue of the mercurial oxidations, we can easily discover around the drop of mercury the presence of very energetic liquid currents directed from the electrode that gives the least disengagement of gas to that which gives the most. We find, in effect, that the drop of mercury which is interposed between the two electrodes is polarised in two different manners; consequently, the part of the drop which is elongated from the electrode, where the gas is disengaged, liberates gas more quickly than the other. Under these conditions it will sometimes happen that the drop of mercury will rotate on its own axis with great speed. It is probable that these effects are caused by the increase in volume of the mercury from the absorption of hydrogen gas and the mechanical action of the liquid currents. The flattening of the drop, and its enlargement in all directions when one of the electrodes is plunged into the centre of the drop, is easily explained. It is sufficient to consider that in this case the entire surface of the mercury receives the pressure of the gas developed at every point.

* This word is employed in the original to embody an abstract idea of movement in the mercury.—[Trans.]

NEW OZONE GENERATOR.

By T. Wills.

The author stated that Siemens' tube had the disadvantages of being difficult to construct, and very liable to be broken; moreover it became heated after being used for some time. This last objection also applied to Bean's apparatus of glass plates covered with tin foil. Sir Benjamin Brodie, in his experiments, had employed an apparatus similar in principle to the Siemens' tube, but the tin foil surfaces were replaced by water. This worked very efficiently, but it was not easy to adapt to other pieces of apparatus. The new generator consists of a piece of glass tube as cylindrical as possible, with a circular coating of tin foil on the exterior; in the interior is a carefully turned brass box, slightly smaller than the glass tube, and tinned to protect it from the action of the ozone. Through this box a current of ice-cold water can be passed so as to prevent the heating of the apparatus, the oxygen or air passing through the annular space between the box and the glass tube, which is fitted with caps and tubes for that purpose. The brass box and tin foil coating are connected with the induction coil in the usual way. This apparatus yields large quantities of ozone with great ease, and appears to be more powerful than either of the other forms of apparatus with the same battery power; its cost moreover is small, and it is not liable to be broken. It can also easily be adapted to other pieces of apparatus, and the current of cold water keeps the apparatus cool, thus allowing it to be used for any length of time.

Dr. Odling said he had worked with the apparatus and could fully confirm what the speaker had said. He also drew attention to the great convenience of employing paraffin joints when working with ozone, as pointed out by Sir Benjamin Brodie, since that hydrocarbon is unattacked by it.

Mr. Bean asked whether the author had compared the new form of apparatus with his, using the same surface, as he had found that a small surface gave more ozone than a large one with the same battery power.

Mr. Tisley, in reply to a question of Mr. Bean as to the difficulty of obtaining large glass tubes, said that for a large ozone apparatus it would probably be better to use a number of comparatively small tubes worked in a cascade.

THE SOIREE OF THE ROYAL SOCIETY.

Sir George Biddel Airy, K.C.B., at his Soirée given as President of the Royal Society, for the last time before his final resignation of the office, had drawn together several objects of electrical interest. Mr. Willoughby Smith's discovery of the effect of light upon the resistance of selenium was illustrated experimentally by Mr. Latimer Clark. A piece of selenium was enclosed in a test-tube connected at each end to platinum wires, and the tube was placed in a box with a sliding cover, so as to admit any desired quantity of light. The resistance was balanced on a Wheatstone bridge, and with the aid of a Thomson galvanometer the movement of the spot of light of course would follow any variation in the resistance of the selenium. With the box closed, the resistance of the selenium remained constant, but immediately the box was opened the light-index upon the scale began to move.

Another very interesting experiment was shown by Mr. Tisley, to prove the effect of magnetism upon ordinary electrolytic action. Water being decomposed in the ordinary manner, the gases were at once set free, but on connecting the electrodes of the battery with an electro-magnet, the gases commenced to revolve around the magnetic poles. A small bath was placed over the magnet, the bath itself forming one electrode, and a plate in the acidulated water of the bath the other electrode. Immediately the coil was magnetized the evolved gases commenced to revolve round the centre plate at considerable speed.

The Post-office authorities contributed a duplex system of telegraphy; Mr. W. H. Preece sent some instruments illustrating his block system of signalling and his duplex relay of 1855; Dr. Gladstone had one of the new air batteries, and Messrs. Elliott exhibited a Thompson-Varley sliding resistance coil. Mr. Browning's collection of Philosophical instruments attracted their usual full share of notice.

CORRESPONDENCE.

TURNEY, Mo., June 25, 1873.

To the Editor of the Journal of the Telegraph:

We have as much respect for "Father Morse" as any other American can have, but many improvements have been made on the Morse instruments and no doubt many more will be made; and why not make improvements on the Morse alphabet? It is old fogyism in the extreme to stick to any one system because it is *good*, and refuse a *better*. We do not like the European alphabet. It is decidedly clumsy. But that is no reason why we may not improve the Morse alphabet. Strike out the spaced characters in the Morse alphabet, and substitute others not spaced, and we will have a much better alphabet than either the European or the present Morse system, and we are sure that it will give general satisfaction to all concerned. Of course there will be a few sore heads to grumble, it matters not whether a change is made or not. The greatest good to the greatest number should be our motto.

E. DUDLEY.

WINTHROP, June 23, 1873.

To the Editor of the Journal of the Telegraph:

"Experientia Docit" (why so euphonious?) will find that the statement made in my last communication is substantially correct. The Morse (by the way, why is it called the Bain alphabet? Is it because it was first used on a Bain instrument?) alphabet had been in use some years before 1857, on the single needle dial instrument, in England and Scotland, and was therefore known to every operator in the service. When it was decided to introduce the Morse, or, as we there called it, the printing instrument, the order, as stated in my letter, was issued and signed by Mr. Culley, giving us a fortnight to adapt what we had hitherto regarded as the single needle alphabet to the new instrument. Mr. Varley, in his article, refers to the introduction of the change of alphabets in the London Districts, which occurred some months prior to its being tried in Scotland. There was no personal significance intended in my letter. I merely wished to demonstrate that once a change of a code or alphabet is determined upon, it is easily mastered by experienced men. The only objectionable feature of the English edition of Morse is in the figures, and these have for some time been practically substituted by certain symbols on important circuits in England, the letters *Fi* being used to denote commencement of figures, and *If* end of figures. They also used a code for the transmission of fractions from one-sixteenth upwards, and which might be used advantageously in America. As "Experentia Docit" is partial to Latin, you will probably oblige him by allowing me to sign myself, this time,

DAT NOBIS HODIE.

To the Editor of the Journal of the Telegraph:

Your article on the subject of unnecessary office messages is very *apropos* in these days of reform. I favor a strong order prohibiting the sending of a single office message, unless it be a notification of "Can't find," or something similar. Let every customer be informed of the method of obtaining a notification of delivery of his message, have everything properly understood by him, and then he won't grumble.

When the question is asked, "Was my message delivered?" I say, "Yes, sir, or we would have been notified to the contrary." Is this rule carried out to the letter? It should be. And then one would feel that he was giving a correct answer, and that the Company had fulfilled its part. Another thing, the *free* message system: it should be limited. There are thousands of unimportant social messages between operators and clerks that could just as well be sent by postal card, and answer every purpose. When we have an urgent message to send, let it be paid for, say at one-half the usual rate. I would willingly pay for mine. If this course were pursued, the Company would be rid of a leech of huge dimensions, and its receipts increased. I hope some of your numerous correspondents will speak upon this subject.

AN OPERATOR.

STEVENSON, Ala., June 30, 1873.

To the Editor of the Journal of the Telegraph:

It is alleged that A No. 1 operators seldom make mistakes on account of the spaced letters, but they do break each other *sometimes*, but never on words that do not contain spaced letters.

It will never do to adopt the "Continental," as it takes a third more time to transmit a message by it, as can be easily proved by writing messages out in both alphabets and comparing results. If any change is made, I trust some attention will be paid to the interests of a class of men now laboring to perfect improved systems, the success of which depends on none of the letters containing over *four* characters.

MULTIPLE.

To the Editor of the Journal of the Telegraph:

To the question, "Shall we change the alphabet?" I should answer emphatically, No!

Before "X. Y. Z." asked the questions he did, he should have shown, by statistic or something like plausible reasoning, which I have not yet seen in any of the correspondence, that the adoption of the "Continental" alphabet, even were it so easily adopted as some "smart Alecks" would make us believe, or a change to some other kind, would accomplish the desired result. Let it be shown that a majority of the errors arise from spaced letters rather than from careless manipulation of the easier ones, as some correspondent has previously held. I am not at all convinced that such is the case. As the spaced letters require more care, it has become habitual with operators, though I grant you not enough so, to take more pains in their transmission; hence, I think no more errors arise from that than from other causes. It is very easy, and very common too, to make mistakes in unspaced letters, by running together, or by getting the dots too far away from the dashes. I think this occurs quite as often as the other. A case has just occurred, under my nose, where "news" was written "noms." Carelessness, Mr. Editor, is at the bottom of ninety-nine hundredths of the errors.

Does Europe, with her "Continental," do business more correctly than we? If so, is it due, beyond a doubt, to the construction of the alphabet? or is it not rather due to their better system and greater care that pervades nearly every department of industry, coupled with their slow and deliberate modes of doing business, especially in the art of telegraphy, where, if statistics are the guide, and I am not in error, they have never attained, until recently, half the rate of speed of Americans? After having distanced the rest of the world in this art, shall we follow that abominable ancient custom of aping everything European, drop out and go in the rear and be ourselves distanced? If so, let us also ape her in another respect, *i. e.*, "postal telegraphy." Shall America, or I would say, rather, the Western Union Company, turn its back on its several hundred operators, who have not only no superiors, but not even an approximate to equals, on the face of the earth, and make out of them only first-class plugs? For, I assert it boldly, not one in fifty would ever attain to the proficiency in their new alphabet that they enjoyed in the old. The Western Union corps of superintendents, as a general thing, are among the very best of these skilled men, which, I take it, is the very basis, or at least the first consideration, of their fitness for the positions they hold. Would these gentlemen, in this respect so well fitted for the place, ever become respectable operators with the new alphabet? Have they time to practice it? It appears to me it would be easier for an entire green hand to learn it than a first-class operator, for he must unlearn the old. Some correspondents say, substantially, it can be mastered in a day. Try, then, a "whack" at about thirty-five or forty words a minute, if its practicable to transmit that alphabet so fast, and see what he will do with it, and give him six months first to practice it. Changing the alphabet, Mr. Editor, would be a very doubtful and a very dangerous experiment. Try the simpler one, which I think is well nigh infallible, for the present alphabet can be used with absolute correctness, with "just a little" care by fair operators. Require proper formation of the characters. Require them to undergo examination. If in their daily practice they are found uniformly incorrect, or hard to read, send them to a fifth rate railroad station, or some other unimportant post. I apprehend that nearly every man who can manipulate at all, can, with a little pains, do it so that it is impossible, without design, to misread it. During twenty years of experience as an operator, etc., I have found very little trouble from the cause complained of, except, as correspondent G. says, the letter "Z," and I have got along very well even with that.

Can it be sustained, Mr. Editor, that the alphabet is very faulty, when it has often been the case that fifty and probably a hundred messages have been transmitted at a rapid speed, without stoppage, and without a break or a bobble, without a word of repetition, and *without a "bull?"*

I desire to ask, also, why the universal mode of handwriting, so full of similar faults, has never been changed? Is there anything in our alphabet half so conflicting as the *u* with the *n*, the *o* with the *a*, the *i* with the *e*, etc., etc.? Yet, by a little care, these are made perfectly plain.

I have not touched upon the "good" of our alphabet, but rest contented after endeavoring to show that it has not all the faults attributed to it. This accomplished, it is very apparent that it excels any other by being faster and more euphonious. Should the Company have "change" on the brain, and must do it, change only the objectionable letters, and, as it appears that it is for the future that so much concern in that respect is felt, be not in a hurry, but "make haste slowly."

TEXAS.

PRAIRIE CITY, June 30, 1873.

To the Editor of the Journal of the Telegraph:

Like many others, I am very much opposed to changing our good old "Morse" alphabet for *any other; decidedly* not for that clumsy collection of characters termed the International or European alphabet. I cannot see where the gain comes in, unless it be as A. J. L. says, in his communication to the JOURNAL of 16th instant, *i. e.*, "an improvement in the quantity of plugs." There surely can be no greater speed attained in transmitting than is reached in using the "Morse" characters. Now, if there really must be a change made, let it be in the spaced letters alone. Methinks it would save a great deal of time and blundering, as well as expense. In my opinion, we had better let well enough alone. We have a good thing already, and I say let us hold to it

MCGINNIS.

Digitized by Google

BURLINGTON, N. J., July 7, 1873.

To the Editor of the Journal of the Telegraph:

Can I speak in meeting? If so, I will contribute my mite for the cause. Twice a month you lay before me the alphabetical case, both pro and con, and am glad to see so much spirit manifested in regard to it. After reading both sides of the case, I find the generality of correspondents are viewing this matter in the same light that I do, that is, in favor of the "Morse." It is sad enough to bury the man, least of all the memory. If we wish to perpetuate his fame, let us not bury his works, which remain as a greater monument than can be hewn from stone or cast in bronze.

I have been at this business some nine years, and find that if we are careful in manipulating the spaced letters in our alphabet that they can be copied down with as much, if not more, facility and correctness than the "European." When you come across a bull, you will generally find a bull-head the instigator of it. It is not the fault of the alphabet—it's the incompetency of the operator. If the Company should adopt this system, it will have to be responsible for a great deal of inward profanity. The first day of such a change would clog business dreadfully, and most likely force the "Morse" back again on certain through wires, to get business cleared. It wouldn't be very acceptable to the public to have to notify them that, on account of the change, their messages would have to undergo a delay, time indefinite. Such would be the case in some offices. There is something very pleasing and musical in our spaced letters, which the true sounder would be able to appreciate if the cumbersome Johnny Bull system came into vogue. There is also grace and symmetry in our alphabet, which, upon adoption of the new, would vanish. I predict bulls innumerable. If this bullish system is adopted, there would be about one of every ten operators who would or could learn it perfectly, and those who have it imperfectly, will, every once in a while, unconsciously, mix the old with new, and make confusion worse confounded.

"Prescott," in his letter to your JOURNAL, dated "Vienna, April 18th," says: "There is none of that hurry and bustle we see at home." I would infer from that that those phlegmatic Germans were slow of movement, and hence the cause—their alphabet. It is an alphabet you cannot very well hurry, for if you do, it will make your dashes into dots.

The contemplated change would involve railroad lines, and I am sure there will be but few who can risk a change, especially where they employ their agents to do the telegraphing.

If there is to be a change, let it be in the "Morse." We can better stand modification than abolishment.

If the correspondence carried on through your valuable paper is not taken as the true sentiment of the American operators in general, suppose there be a vote polled upon the subject, the Company to furnish each operator with a double ticket, one with "Morse" or "American," and the other "European," printed on the face, and let each operator forward his vote to his district superintendent, and the result from him to General Eckert, New York. Let there be a day appointed when voting will cease and polls closed, and three judges appointed by the Company to receive the returns and decide. I would guarantee that the vote would be almost unanimous for "Morse."

You may think this would be unnecessary trouble for a small end, but I think the opportunity would be eagerly seized upon by those who are not accustomed to penning their ideas upon paper to give expression on this subject. A.

STUPIDITY, OR WHAT?

To the Editor of the Journal of the Telegraph:

Now that the Company are considering the necessity of reducing free service messages to the lowest possible number and length, we submit below copies of two office messages passing between offices 1,500 miles apart; and would ask if such accommodation service pays, the present low tariff considered?

Enquiry: "Can you deliver message Rodolpo Pirjeon, 93 Old Levee street, is such a party there? Answer quick."

Reply: Yes, we can deliver message to Rodolpo Pirjeon."

Twenty-six words of office correspondence.

N. O.

VERGENNES, VT., June 25, 1873.

To the Editor of the Journal of the Telegraph:

How many words in the following message:

To Edward Page & Co., 22 William St., New York.

Are trying to get boat. How much more time can we have? (Signed) J. G. HINDES, Agt.

I claimed there was 12 words, while repeating office declined to receive it unless "agt." was counted one word, making in all 13 words. Mr. Hindes was standing by at the time, and I told him that "agt." must be counted. "Very well," he says, "make the signature 'National Horse Nail Comapny' instead of 'J. G. Hindes, Agt.,' if that suits him better," which I did, and the repeating office was satisfied with that and made check 12 words. Now I fail to see where the saving comes in. It seems to me that simply the words agt., sec'y, treas. or cash'r, affixed to a signature, would be much better for the Company (and save time in transmission) than to give the full name of a firm, company or bank, which are in many cases long, but cannot be counted as part of message. Please give your views in JOURNAL. I have not seen a case that is exactly like this. J. S. HICKOK, Manager.

Answer.—There are thirteen words in the message given. The question is not one of money making on the part of the Company, but is instituted as a protection against abuse. Any legitimate signature, however long, will be transmitted free under the rules, but any addition, conveying information, should be counted as part of the body of a message and charged for.

To the Editor of the Journal of the Telegraph:

Supposing a party should "get wind" that another party purposed sending a message to a third party at some other place that would be a serious damage to first party, and said first party should forbid me sending such message in case it was presented; would I be upheld in sending such a message, providing sender tendered money for same. Please answer through JOURNAL. "QUERY."

Answer.—You would not be upheld in refusing to transmit any message for which payment is tendered; the construction of which conforms to the rules of the company. You may safely disregard the prohibition of the party who has "got wind," or any one else.

MONROE, June 24th, 1873.

To the Editor of the Journal of the Telegraph:

Please answer this in your next issue: "When an operator gets a per cent. instead of a salary, is he compelled to pay anything but a per cent. on deficits?" Say he gets three-fourths of gross receipts, has he a right to pay anything more than three-fourths of gross deficits? B. W. M.

Answer.—Under these circumstances it appears to us that he should be liable for one-fourth only of the gross deficits.

To the Editor of the Journal of the Telegraph:

I would like to know the proper way of checking a message as follows: When a message is sent to me from any office "collect" to a certain party, and after searching, I find that the party has gone to another place, and I forward the message to him, "Collect," which is, of course, the tariff from the first office to my office, and the tariff from my office to the destination. Now, how is the proper way for me to check the *first* office, and for him to check me? SYLVESTER.

Answer.—Check yourself with the amount to be collected for the first service, and on the second credit yourself as having paid the same amount to "other lines." See reply to L. C. Orvis, in JOURNAL of December 16, 1872.

J. J.—Fac simile telegraphs have been invented by Bakewell, in England; Casselli, in Italy, and by Meyer and Lenoir in France. None of them, excepting Meyer's, have been put to practical use; and this, after working for some time at a few stations in France, has been abandoned.

A.—There are fourteen words in the following message:

"Miss Jennie Green,
with Montgomery & Sons,
Hurricane, Miss.
care Scharff Bros.,
Vicksburg, Miss.

Come immediately—your mother is taken with paralysis."

The words "with Montgomery & Sons, Hurricane, Miss.," should be charged for.

There is nothing arbitrary in this rendition. There is an extra address; it cost something to send it, and that cost should be defrayed by the sender and not by the company.

B.—See answer to A.

J. M. D.—When you receive a free message for a person living three miles distant from your office, without instructions as to delivery, it is your duty to notify the sending office of the cost of delivery and await instructions. Exactly the same course should be pursued with a paid message.

C. B. SKEGGS.—There are ten words in

"Dr. Meeker was in the office this morning,
Wm. M. McPherson,
P. M."

P. M. should be counted.

J. W. K.—When a message is received for delivery by special messenger, charges guaranteed, you are to collect the amount from the party addressed. Failing to do so, notify the sending office and he will collect the amount from the sender of the message. It should be borne in mind that the charges must not exceed the actual cost of the service.

J. S. C.—There are sixteen words in the following:

"Send me, without fail, by express to-morrow, a new pitman. Last you sent broke.
(Signed,) ——
Answer quick."

L. A. HUNTINGTON.—There are twelve words in "Meet me with Coupey 42d st., 8:15 train, to-night, Monday." Figures should be counted for as many words as they contain when written out. You should not, however, have accepted the message in the form given. See Rule 6, of the book of regulations.

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
July 15, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

The tariff to points on the International Ocean Telegraph lines south of Lake City, Fla., will hereafter be as follows, in addition to the rate to Lake City, from all offices north of Lake City.

Baldwin.	50	4	Ocala.	100	7
Bartows.	100	7	Pine Island.	150	10
Branch River.	150	10	Punta Rassa.	150	10
Caloosahatchie River.	150	10	St. Augustine.	50	4
Gainesville.	50	4	Sanderson.	50	4
Jacksonville.	50	4	Sumterville.	100	7
Key West.	400	30	Tuckertown.	100	7
Newnansville.	50	4	Palatka.	100	7

Bear Creek, Ga., changed to Hampton.
Pleasant Valley, Idaho, re-opened.
Old Orchard Beach, Me., re-opened.
Pigeon Cove, Mass., re-opened.
So. Weymouth, Mass., closed.
Weymouth, Mass., closed.

There is now a W. U. office at Falmouth, Mass., square 18 check direct.

Clark City, Mo., closed.
Summit, Mon., closed.

Herreafter the "Tariff for Other Lines" to Bullionville, Nev., will be 50 and 5 from Pioche City, Nev.

Boars Head, N. H., re-opened.
Farragut House, N. H., re-opened.

Ocean House, Rye Beach, N. H., was destroyed by fire. Messages addressed simply Rye Beach, N. H., should be checked to Farragut House.

Messages may be taken for Little Boars Head, Jenness Beach and Frost's Point, N. H., to be delivered from Farragut House, N. H. Charges for delivery, 50 cents.

Deal, N. J., re-opened as a W. U. office; square 47. Check direct.

Cascade, N. Y., closed.

The W. U. office, at Bloomfield, O., square 170, printed in the tariff book, is in Jefferson Co., and Bloomfield, the new office on Other Lines published in JOURNAL of June 15, with tariff from Youngstown, O., is in Trumbull Co.

Smysers, Pa., closed.

Business for Lykens, Pa., will hereafter be checked direct.

Pleasant Valley, Luzerne Co., Pa., closed.

Manayunk, Pa., the W. U. office printed in tariff book, is in Phila. Co.

Watch Hill, R. I., re-opened. Tariff same as heretofore.

Tiverton, R. I., re-opened. Check direct.

The following Summer offices in Virginia are re-opened:

Healing Springs, Rockbridge Baths,
Hot Springs, Sweet Chalybeate Springs,
Jordon's White Sulphur Springs, Warm Springs.
Rockbridge Alum Springs.
Old Sweet Springs, W. Va., changed to Sweet Springs.

NEW OFFICES.

60 Delmar, Del.
237 Hampton, Ga.
359 Chester, Randolph Co., Ill.
307 Grayland, Ill.
358 Nebo, Ill.
307 Oswego, Ill.
238 Steel's Mills, Ill.
397 Dean, Iowa.
* Fort Point, Me, 25 2 11 Stockton.
25 Oxford, Mass.
18 Wareham, "
118 Frankfort, Mich.

The Tariff to square 118 is the same as to square 119, with the following exceptions:

Between square 118 and—

Square 100	50	Square 210	75
" 108	50	" 220	75
" 119	40	" 230	50
" 127	75	" 240	75
" 128	75	" 250	50
" 137	50	" 260	50
" 138	75	" 269	40
" 147	75	" 279	50
" 148	75		

270 Watervliet, Mich.
388 Cahoka, Mo.
398 Clifton, Mo.
47 Asbury Park, N. J., P. O. A, is Ocean Grove P. O.
57 New Hartford, N. Y.
2 Maitland, N. S.
213 Manchester, O.
121 New Bethlehem, Pa.
76 Tower City, Pa.
292 Greenbrier, Tenn.
510 Van Alstyne, Texas.
103 Doe Gulley Tunnel, W. Va.
152 Flemington, W. Va.
122 Green Spring Run, W. Va.
141 Tunnelton, W. Va.
* Rowley Springs, Va., 85 6 77 Alexandria, Va.
143 Sweet Springs, W. Va.
297 Francksville, Wis.
297 Lake, Wis.

Everson, under head of New Offices, in last JOURNAL, should read Everson, Pa.

Offices having "special sheet A," will check Tower City, Pa., 35 cents more than "special rate" to Philadelphia. Present square rates not to be increased.

The arrival or departure of Ocean steamers at Sandy Hook, N. J., can be reported to any office of this Company, at any time during office hours, for $1.00, in addition to tariff on the message from New York to the place of destination. Managers should note this fact and inform parties desiring such reports.

Applications should be addressed, Manager, Quarantine, S. I., and if sent by telegraph, should be paid for.

ATLANTIC CABLE BUSINESS.

We are notified of the following change in rates on Atlantic Cable business to points given below:

Greece—Via Turkey	$2 25
Spain—Via Falmouth	2 00
Japan—Nagasaki, via Falmouth, Teheren, or Siberia	40 38
Japan—All other places, via Falmouth, Teheran, or Siberia	43 00
China—Amoy, Hong Kong, Shanghai, via Falmouth, Teheran, or Siberia	30 00
Russia, in Caucasus	3 12
Russia in Asia, West of Tomsk	4 16
" " East of Tomsk, and West of Werkline Ondinsk	5 82

The Japanese Government charge double rates over their lines for telegrams which are not written in the English language, addressed to places in Japan, other than Nagasaki. An extra charge, therefore, must be made for these messages of $2,62 for 20 words, and half-rates for every additional 10 or fraction of 10 words.

We are also notified that messages forwarded by private persons to the Ottoman Empire must be written in plain ordinary language—code or cypher not being allowed.

The Cable between Trinidad and Demarara, in the West Indies, is broken, and messages for Demarara are now delivered from Trinidad by steamers on 6th and 21st of each month.

WILLIAM ORTON, *President.*

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, July 11th, 1873.

On and after July 15th, Brookville, Pa., will be added to the list of Money Order Offices in C. O. Rowe's district; and Dunbar, Pa., in same district, will be closed as a Money Order Office.

G. H. MUMFORD,
Vice-President.

AMERICAN CENTRAL TELEGRAPH COMPANY.

This company was recently organized at Davenport, Ia. The capital stock is to be $1,000,000, of which five per cent. is to be paid in at once, and the rest in instalments as called for. Edwin S. Chamberlain, G. A. Rhodes, Jr., and A. C. Stedman are the directors for the first year.

The steamers Kangaroo and Edinburgh arrived at Placentia, Newfoundland, on Sunday morning, July 13, with cable on board for two lines between that place and Sydney, Cape Breton. The Edinburgh came into collision with an iceberg in a dense fog off Cape Race. Her bow gear was damaged but the ship was not much injured.

TELEGRAPHERS' MUTUAL LIFE INSURANCE ASSOCIATION.

The acknowledgment of receipt of any assessment is to be understood as an acknowledgement for all previous assessments:

ACKNOWLEDGMENTS OF RECEIPTS FOR ASSESSMENTS NOS. 42 AND 43, UP TO AND INCLUDING JULY 10TH.

W. W. Cummings has been appointed agent at St. Louis, *vice* J. P. Cassidy, resigned, to enter other business.

A NEW THERMO-ELECTRIC BATTERY.

A new form of this battery, recently invented by Mure and Clamond, consists of sixty pairs, made of iron and lead, and the electro-motive power is equal to two Bunsen elements. By the use of thirty-nine gallons of gas, about two drahms of copper were precipitated in an hour, the surface of the electrodes being eleven square inches, and their separation from one another 0·4 inch. The cost of depositing 2 2-5 lbs. of copper by this battery, in Paris, where gas is sold at three cents per thirty-five cubic feet, would be $2.36.

The largest battery which has been as yet constructed upon this plan consists of 150 large pairs, and has an intensity equivalent to five Bunsen cells of medium size. A battery of 560 small pairs, arranged for tension, have an intensity equal to sixty Daniell cells. In both cases, the gas consumed is about 210 gallons per hour.

FOREIGN TELEGRAPHIC ITEMS

PROGRESS OF THE BRAZILIAN CABLE.

The Government of Brazil has lent the steam corvette, "Vital de Oliveira," commanded by Captain Mello Tamborin, for the service of effecting the soundings along the Brazilian coast, preliminary to laying the telegraph cable, for which the concession has just been granted to the Telegraph Construction and Maintenance Company of London, which is also to lay the transatlantic cable, and acts with the Brazilian Submarine Telegraph Company and the Great Western Telegraph Company. Major Wood, the representative of the latter company, is still in Rio Janeiro, and will superintend the engineering of the coast cable, and the sounding apparatus has already been ordered by him from England, together with a staff skilled in its employment. The work of sounding will be commenced shortly.

The transatlantic cable will be laid next year, but the Coast Cable Company is only bound to lay the Rio and Pernambuco section, or the Pernambuco and Para section, within three years, and the whole within five. The concession covers the whole seacoast of Brazil, so that the company can join on at the north and south with lines from other countries, such as the River Plate system, and that being laid from the West Indies to Demerara. The Government land lines are progressing, and the communication between Pernambuco and the south of the Empire should be complete by the end of this year.

TELEGRAPHY AT THE ANTIPODES.

The Melbourne *Argus* reports the following news from South Australia:

A party is (May) about to be dispatched, under the command of Mr. Richard Knuckey, to the Roper River, North Australia, by steamer, to errect iron poles along the line of the overland telegraph. Poles to the number of 1,000 have already been landed there, and more are to be shipped from Melbourne. The party will have to erect 4,000 between Elsie Creek and a point thirty miles south of Tennant's Creek. Arrangements have been made for the substitution of iron poles for alternate wooden poles on the section immediately south of Port Darwin. A quantity of poles has been sent inland by teams which started from Port Augusta, and steps have been taken to provision the different stations, some for nearly two years, others for nearly three years.

THE INTERCOLONIAL AUSTRALIAN CABLE.

An agreement for the construction of a cable from New Zealand to New South Wales, and from Normantown to Singapore, has been signed by the conference representatives of New South Wales, Queensland and New Zealand. The agreement is to the effect that these colonies shall guarantee five per cent. upon one million pounds for thirty-five years, on condition that the cables are constructed for that sum. Receipts of over twelve thousand pounds go to reduce the guarantee. The arrangement will effect a reduction of thirty per cent. on the rates charged for messages *via* Singapore, as compared with the Java cable rates. Mr. Audley Coote, agent for the Indo-European, Atlantic and other leading telegraphic companies interested in the construction of the cable, has been instructed to accept the proposals of the delegates for the construction of the line. The tariff of charges is as follows: From New Zealand to New South Wales, not to exceed 15s. for twenty words, and 9d for each additional word; from Normantown to Singapore, 40s. for twenty words, and 2s. for each additional word.

THE NEW TELEGRAPH SHIP.

In the *Telegraphic Journal*, for February 15, it was announced that the directors of Hooper's Telegraph Works had ordered a steamer to be built expressly for the purpose of reducing the expense and lessening the risk of submerging telegraph cables. On Wednesday, June 11th, a party of scientific gentlemen assembled at Millwall Docks to inspect this new vessel. She is 350 feet in length, 55 feet beam, and 36 feet in depth, and of 5,000 tons gross register, with engines of 400 nominal horse-power working up to 2,000, and realizes, though not intended for speed, 10½ knots an hour. Being the first vessel ever constructed entirely for telegraphic purposes, her tanks, which are only three in number—huge cylinders, 30 feet deep and 53 feet wide—so far from being a source of weakness, really strengthen the hull; while the paying-out machinery, and the appliances for picking up a lost or damaged cable, embrace every improvement which experience up to the present time has suggested. The vessel is now taking in 1,500 miles of cable directly from the Hooper works, at Millwall, belonging to the Western Telegraph Company, which is about to lay 2,500 miles of cable along the east coast of South America. The work will be performed in three sections, the first, that which is now about to be despatched on board the "Hooper," being laid from Pernambuco to Rio de Janeiro, the second from Pernambuco to St. Thomas and the third from Rio to Montevideo, taking in all the intervening South American ports. After inspecting the works of Hooper's Telegraph Company, the party adjourned to the vessel—a noble, though somewhat unsightly, craft—much interest being felt in the perfect electrical testing cabin, fitted up at the suggestion of Sir Wm. Thomson, who, with Mr. Latimer Clark, represented science on the occasion, and showed the means by which signaling and testing for insulation can be carried on at the same time.

By the last mail from Melbourne, Australia, information has been received that two new telegraph stations have been opened on the coast—one at Wilson's Promontory, which has long been required for the shipping between Sydney and Melbourne. Vessels by way of Sydney can now be telegraphed twelve hours before arriving at the Heads. The other station is at Cape Jervis, on the South Australian coast.

The success in laying the new Atlantic cable has created a strong demand in London for the Anglo-American and French cable shares.

The telegraph cable between the island of Cuba and Porto Rico is in working order again.

The Mexican telegraph line between Minatitlan Vera Cruz has been completed.

The New York, Newfoundland and London Telegraph Company announce that the register of transfers will shortly be closed, for the purpose of the amalgamation with the Anglo-American Telegraph Company. The exact day will soon be given.

The total number of messages forwarded from postal telegraph stations in the United Kingdom, during the week ending June 14, 1873, was 339,772—an increase on the corresponding week of the previous year of 40,815.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended the 21st of June, 1873, was 341,551; an increase over the corresponding week of the previous year of 37,262.

SUGGESTIONS CONCERNING THE CARE OF REPEATERS.

By Eugene Cadmus.

Telegraphers fall short of perfection in many things, but what many of them don't know about the repeater would make a larger book than some of our voluminous manuals of electricity. The repeater plays so important a part therein, that its management, if not properly done, is one of the most annoying and disastrous obstructions to the working of long circuits.

Here, then, is a chance for the diffusion of usefu. knowledge. Let some of us, who think we know how it should be done, try our hands as an advisory board upon the management of the repeater.

Speaking, now, with reference to the Milliken instrument—that manufactured by Mr. Phelps, in New York—there are those who have lived to learn that it takes the nitric acid, or Grove, cell as local battery to develop the full effectiveness of the instrument.

Those who persist in using other forms of local battery are liable to have sarcastic remarks addressed to them about their "old trap." But the wise managers trim their repeaters with two cups of Grove battery on the regular local, and one on the extra, and when they are going to be up all night, they replenish the nitric acid twice each day, using the spent acid in their main batteries. Greater uniformity in the working of the instrument is maintained thereby.

Both economy and convenience would be subserved if, in cases where a set of repeaters are only used occasionally, the required amount of nitric acid for a cell was put in a small glass-stoppered bottle, and enough prepared solution to fill the tumbler in a larger bottle. Let the battery be set up dry, with all the connections made, and one of each size of bottle placed handily by each cell of the local battery. Very quickly and neatly could the batteries be put in action when, late at night, or to supply an immediate and pressing necessity, the repeater is needed.

Experience has taught that the armature of the small coils of the relay needs adjustment but seldom if the locals are in proper order. It is as natural for a greenhorn to dive for that upper spring as a duck for sunken corn; and some won't believe that the relay is to be treated as an ordinary relay would be.

The lever of the sounder is better adapted for sledge-hammer movement than that of the relay, and is rendered rather more effective thereby. Perhaps 3-16 of an inch is not too much play, and here is the prime feature of the sounder, viz.: Let the tension on the lever be only moderate—a little more than enough to draw it up. It is utterly impossible to work well through a repeater, whereof the sounders are adjusted to sound as light as many operators prefer. When most efficient it usually sounds as if it dragged slightly. With their relay properly adjusted, they need not fear that the opposite side will be unable to break.

Tight thumbscrews, clean points, and each pole of every magnet equidistant from its armature, conduce to the best results.

If operators would realize that it is best to throw the circuit open for about two seconds when they wish to break through two or more repeaters, it would be well.

This, and much other theoretical knowledge of this instrument, will be required when we have examining boards in the telegraphic service.

Washington, D. C., July 7th, 1873.

Journal of the Telegraph.

This Journal is issued on the 1st and 15th of each month. Its circulation is over 8,000. It goes to every State, Territory and Province on the Continent. It has become a necessity, and is always welcomed as a friend. No better medium for advertising exists.

TERMS:

ONE DOLLAR PER ANNUM IN ADVANCE.

Address—

JOURNAL OF THE TELEGRAPH,

Western Union Telegraph Company,

145 Broadway, New York.

NEW YORK, JULY 15, 1873.

SUPPLEMENT TO THE JOURNAL.

The supplement which accompanies this issue of the JOURNAL contains all the changes in tariffs which have occurred since the last book of rates was issued, in October, 1872. It includes the subject-matter of the Supplements issued September, 1872, and March, 1873. Managers should compare their books with the Supplement, and make a careful revision.

STUPIDITY, OR WHAT?

In view of the instructions, many times given in the JOURNAL, concerning the transmission of unnecessary office messages, it is hardly possible to believe that stupidity and inattention can exist to the extent indicated by the communication of N. O., which will be found in our columns of correspondence of this issue. It is evident that a classification of managers and clerks, as well as operators, would result beneficially to the Company.

THE NEW ATLANTIC CABLE.

The shore end of the new Atlantic cable was successfully laid on the Fourth of July from the steamship "Hibernia," and the communication is perfect between Heart's Content and Valentia.

TELEGRAPHERS throughout the country will confer a favor by sending to this office any item relating to electrical or telegraphic progress which may come under their observation. Many items frequently appear in local newspapers, which would be interesting to the craft at large, which we would gladly reproduce in the JOURNAL for their benefit. The JOURNAL aims to be a complete compendium of the progress of electrical science and telegraphy, and its friends can render material aid in maintaining its high standard Their assistance will be received thankfully.

MANAGERS will please observe the notice in the tariff circular, by which parties throughout the country can receive information of the arrival of vessels off Sandy Hook at a fixed rate.

LET TELEGRAPHY BE TAUGHT IN THE PUBLIC SCHOOLS.

The great moral power of the nation is attributable, beyond a doubt, to the system of State education for the masses, and it is equally certain that in the educational intelligence of the people lies the strength of our peculiar form of government; hence it is desirable that no useful knowledge should be withheld from the youth of both sexes who now attend the public schools. The theory of our institutions, that all classes are equal, and that the children of the poorer classes shall receive the same privileges in education as those of the rich, while sound on general principle, is not unmixed with evil, and to the course of studies at present pursued is directly traceable many of the crimes which now outrage society. It must not be understood, however, that we attribute these evils to the fact that education is open to all; it is rather to the fact that the education given is aimless. The children of the rich and of the poor are upon a very democratic level while at school, and finally graduate with the same general acquirements in knowledge; and if in society education and personal merit were alone the requisites of *social* equality, nothing could be better than the present system. We are aware that upon this assumption is based the system of common school education, but there is a radical fault in not carrying the instruction to a proper and legitimate conclusion.

Upon leaving school and entering into the active business of life, the graduates are no longer socially equal. The riches of the comparatively wealthy enable him to enter into a pursuit for which he is qualified by taste and education, and which is ultimately certain to still further advance his pecuniary interests, and finally result in a competence, and, it is to be presumed, all the worldly happiness attainable. The poor person returns to the social condition from which he emerged, and from which he has no hope of escape, owing to the want of means to place him in a position for which he, by education, has become qualified. For a while he follows some humble calling, until, overcome by discontent, intelligent roguery receives another recruit, and society at large is made to suffer.

Now this condition of affairs can be remedied, to a great extent, by giving aim to study. It is worse than useless to educate a person for a sphere of life which there is little probability of his filling. It serves only to engender disgust and determination to escape from his unhappy position in any manner. Why cannot the teaching of some useful and honorable business be incorporated into the studies pursued at our common schools? At present there occurs to us three professions which could properly be taught—Telegraphy, Civil Engineering and Book-keeping. Either of them could easily be acquired by an intelligent scholar. All are of the first rank as business pursuits, and each needs a greater amount of first-class talent than it now possesses. Here are fields of honor and usefulness for many who, without such advantages, may find that the well-intentioned efforts to advance their positions in life by education, has served only to produce moral degradation.

We desire to speak more particularly of the telegraphic business. Telegraph companies are always in need of good operators, the supply being never equal to the demand. Of poor and indifferent operators there is, and probably always will be, a superfluity.

Many of the better class, from time to time, leave the ranks to engage in other pursuits, leaving vacancies hard to fill, and the expansion and development of the telegraph continually affords opportunities for which there are no competent takers. The vast field of private telegraphs, thus far comparatively untouched, will yet furnish employment to many thousands of persons who, from their knowledge of the art, will command situations in preference to those who lack that knowledge, and at higher salaries.

The telegraph companies are in continual receipt of applications for positions from persons of finished education, graduates of universities, whose services, did they possess the ability to manipulate the telegraph, would be very acceptable. Had these persons been taught telegraphy they could at once have passed from school into well paying situations, where future progress is limited only by capability. If telegraphy should be taught in the public schools, the result could not but prove beneficial to the companies and their employés. Better work would be performed, and the business be elevated. Operators of ability, now in the service, would find their positions improved, while those of inferior skill would feel the necessity of putting forth every effort for improvement, in order to keep step with the progress of the times.

Good penmanship, a knowledge of the elements of grammar, and a proper idea of punctuation, are essential to the first-class operator. The telegraphist of the future will possess these acquirements, for, without them, he will be deemed incompetent to fill any position upon the lines.

THE INTERNATIONAL PATENT RIGHT CONGRESS.

Notice is given in the Vienna journals that the International Patent Right Congress will commence on the 14th of August. An Imperial Commission has been appointed to arrange the preliminaries. The language used at the Congress will be German, but French and English will be permitted. The decisions of the Congress will be communicated through the several commissions to their respective governments.

Inventors, and proprietors of inventions, are actively moving in the matter, and a large and important gathering is anticipated.

MARIETTA, Ohio, has the telegraph mania. The city is full of short lines from house to house, and more are projected. The ladies especially are interested in learning the art, and they are no doubt preparing for the coming day when, by the magic touch of the key, fair hands will summon papa from the bank or store to his long-neglected dinner, or tell him to bring the doctor for Eddie, who has a sudden relapse of the measles. But we hardly think the ladies will be satisfied with even this pleasing picture of the future. They will never be happy until they can sit down to a telegraph instrument in their parlor, and be in direct communication with all the places wherein a belated husband or brother is supposed to pass his evenings when he goes down street "to see a man."

TELEGRAPHING TO TEHERAN.

In connection with the visit to England of the Shah of Persia, the London *Daily Telegraph* says: "As might be expected from a monarch of his enlightened views, the Shah has always felt the deepest interest in the telegraph line which traverses his kingdom, and by which he is now enabled to conduct all State business at his capital as well and as speedily as if in his own palace. The line by which this is effected is primarily an Indian line, since it joins, at Teheran, the lines of the Indian Government, one of which proceeds from the Persian capital to Shiraz and Bushire, then entering the Persian Gulf, touches only at an intervening promontory, and continues a submarine line to Kurrachee, a duplicate line being carried from Bushire to the same point overland. Between London and Teheran the Indo-European Company's line crosses the North Sea from Lowestoft to Norderney, and thence to the main land, where it proceeds direct to Berlin, Warsaw, Odessa, the Crimea, Tiflis, Tabriz, or Taurus, to Teheran. With the exception of where it crosses the Straits of Kertch, the line is carried altogether overland. It is possible to work direct from London to Bombay without any retransmission, but the common commercial working from London is direct to Teheran or Bushire; and there was, therefore, no difficulty in keeping the Shah in constant communication with his capital, both at Berlin and in London—a convenience which both the sovereign and the members of his suite fully appreciate and amply use. At Buckingham Palace a special wire has been carried over the roof from the Southwestern District Post-office, at Buckingham Gate, into an apartment adjoining the bed and bath rooms of the Shah. On the night of his arrival, the first act of the Shah was to pay a visit to the telegraph office, and, in consultation with his Grand Vizier, to communicate at once with Teheran. Dr. C. W. Siemens, F. R. S., the principal promoter of the line, was present, and had the honor of an introduction to the Shah, who conversed for a long time with him, and sat by the instrument—cleverly manipulated by one of the best operators of the company, a young German, Mr. O. Moll, who is told off for the service—deeply interested, as sentence after sentence, flashed direct from his capital, was received before his eyes, and transcribed by the Grand Vizier for his perusal. His stay at Guildhall, last evening, was rendered doubly agreeable to him by the same facility being afforded. The Lord Mayor and Mr. Andrews, Manager of the Indo-European Telegraph Company, arranged that a wire should be carried into the library, and attached to an instrument on the dais, in charge of Mr. F. Moll, brother of the operator in charge at the palace, and the address and the Shah's reply were flashed as soon as delivered to Teheran. As, however, the difference of time is three hours and twenty-seven minutes, Teheran being that amount later than London, the communication, of course, only reached the Shah's faithful Regent and Ministers early on Saturday morning, in ample time for easy publication to the population of the Persian capital. This difference in time is somewhat inconvenient for the Prince Governor of Teheran, who had to be turned out of bed when his august master's first London message reached him, and who will clearly have to keep a sharp eye on the British metropolis so long as the Shah or his Grand Vizier is within reach of the telegraph. That great officer had little peace of mind after being disturbed, as he described it, at the fifth hour of the night, for a conversation was kept up between Buckingham Palace and Teheran for three hours. Dr. Siemens was highly complimented by the Shah on the great achievements of his company, and the greatest satisfaction was expressed that the route of the company's line should be through the Persian dominions. However honorable Mr. Moll's post may be, it is by no means an easy one, for his work seems to be almost incessant. He will be a close prisoner during the Shah's sojourn in the metropolis, never being, day or night, beyond the sound of the "calling" of his instrument, which is placed on a dressing table in a bed room overlooking the garden. Long messages pass daily in cipher, on affairs of state, between the Shah and his Grand Vizier and the Prince Governor of Teheran. In addition to these cipher communications on secret matters, a vast number of messages are transmitted in French on domestic matters, their nature indicating that family affection is as warm among the Persians as among other people, and affording another proof, if any were needed, that human nature is very much the same all the world over.

LETTER FROM MR. R. S. CULLEY ON THE PROPOSED CHANGE OF ALPHABET.

The following letter from Mr. R. S. Culley, Engineer-in-Chief of the British Postal Telegraphs, to Mr. George B. Prescott, Electrician of the Western Union Company, containing information of much value regarding the proposed change of alphabet in this country, has been kindly handed to us by Mr. Prescott for publication:

LONDON, June 27, 1873.

DEAR MR. PRESCOTT:

As the change of your spaced letters is still discussed in the JOURNAL (which I always read with great pleasure), it occurs to me that although you already are aware that we in England do not dread change, and have had a somewhat large experience of altered codes, it may hardly be known to your readers how very completely our alphabets have been altered, and how very little inconvenience has arisen therefrom.

We, I mean the Post Office and the "Electric" Company, have had to learn and use the following codes or modes of reading:

1. Double Needle.
2. Single Needle, old code.
3. do do new, formed from No. 8.
4. Bell, old code.
5. Bell, new code, formed from No. 8.
6. Sounder, formed from No. 8.
7. Bain, or Morse, old code.
8. Morse, Continental code.

All our existing alphabets are formed on No. 8.

I have made inquiry, and my own recollection that no important delay, error or inconvenience arose from any one of the changes, although, as you know, several of them were very great, is supported by the recollection of my fellow-officers.

Were it necessary to make a further change, no very great difficulty would be anticipated; *none whatever if four letters only were concerned*, as in your case, epecially if it were known that those letters led to error in the hands of the less careful operators; and it would not, I think, occur to any of our men to object, on national grounds, to accept from you or any other nation anything that was thought good. Indeed, our present code was accepted from the Continental administrations, and although Ireland was, before the transfer, almost entirely worked on the old Bell code, we are now using your Sounder as fast as we can provide apparatus, instead of the Bell.

It may be objected that our system, even now, is not so extensive as yours, and that, therefore, our difficulties would not be so great. But it does not increase the difficulty to *each individual* operator, or at each station, if more individuals or more stations are concerned.

The method we adopted was to give notice, two months or so beforehand, that on a certain date we should work new code in the slacker part of the day, and at a further date, constantly.

The change from 4 to 5 was made in 1871; from 2 to 3 and 7 to 8, in 1856. I think there were changes in a few letters of 7 once or twice before we finally adopted No. 8. If we found two letters were mistaken for each other, they were altered.

Several of our railways have changed from 1 to 3, and without serious difficulty, although the operators were porters and signalmen in most cases.

I give you the three alphabets of the Electric Company, expressing the needle code in Morse characters for convenience. Believe me,

Yours ever truly,

R. S. CULLEY.

G. B. PRESCOTT, Esq.

BORN.

FERGUSON.—At Somerville, N. J., June 1, 1873, to Robert S Ferguson, W. U. Tel. Co., a son.

MARRIED.

HALL—BROWN.—At Grace Chapel, Watertown, on Wednesday, June 18, by Rev. John A. Staunton, George Hall, of Ogdensburgh, and Helen E., daughter of Lysander H. Brown, Esq., of Watertown.

LATTIME—MARCHBANK.—At Seaford, Del., June 29, 1873, A. W. Lattime, lineman W. U. Tel. Co., of Philadelphia, to Miss Fannie Marchbank, of Seaford.

LELAND—MARTIN.—At the residence of the bride's parents, Rochester, Ind., A. N. Leland, agent and operator at Etna Green, Ind., to Miss Libbie Martin.

DIED.

MERKT.—At Alfred, N. Y., June 26, 1873, Wilfred H. Merkt, son of C. H. Merkt, manager W. U. Tel. office, aged 4 months and 16 days.

THE DURATION OF LIFE OF SUBMARINE CABLES.—Considerable excitement having of late taken place with reference to the life of submarine cables, it will be satisfactory to shareholders in this class of property to learn that some exceedingly interesting specimens have just been raised in the Mediterranean, after a submersion of fifteen years. Although not made upon the approved plans now in use, such as galvanized wire and hemp protected by patent compounds, the cable is in such a state as to warrant its being relaid in another part of the Mediterranean, with every prospect of its being able to do good service for another lengthened period. This affords most satisfactory evidence as to the durability of submarine cables.—*Standard.*

GEO. H. BLISS & CO.

SUCCESSORS TO

BLISS, TILLOTSON & CO.;

41 *THIRD AVENUE,*

CHICAGO, ILLINOIS,

MANUFACTURERS AND DEALERS IN

Telegraph Machinery and Supplies,

GALVANIZED AND PLAIN WIRE,

INSULATORS,

AND EVERY DESCRIPTION OF

OFFICE AND BATTERY MATERIAL

ALWAYS ON HAND.

INSTRUMENTS REPAIRED AT SHORT NOTICE.

PENSACOLA TELEGRAPH CO.

Connect with the lines of the WESTERN UNION TELEGRAPH COMPANY at Pollard, Ala.

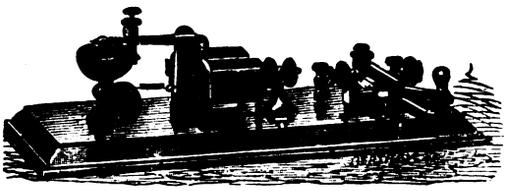
Governed by the same Rules and Regulations as the Western Union Telegraph Company.

WATTS & COMPANY,

Baltimore,

MANUFACTURERS OF

Electrical and Telegraph Instruments



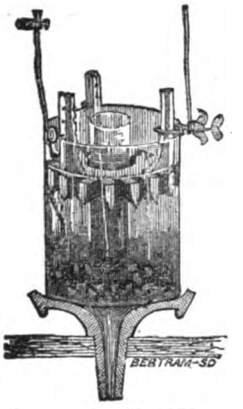
AND

MATERIAL OF EVERY DESCRIPTION,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, Etc., Etc.

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER.



ENTIRELY NEW.

Furnished in a small black walnut box—which holds pens, pencils, paper, wire, pliers, etc., for opening temporary offices at breaks, etc. It is a complete railroad outfit, and supplies a want which has long existed.

SOLE MANUFACTURERS OF THE

NEW PATENT BALTIMORE BATTERY,

MADE IN THREE SIZES.

No. 1.
Size of Glass, 8x7½ inches,
Specially adapted to Railroad Signals, Printing Instruments etc., etc.

No. 2.
Size of Glass, 8 x 6 inches.
For Locals and Main.

No. 3.
Size of Glass, 7 x 5 inches.
For Light Main.

This Battery is most extensively used throughout the Country having proven the cheapest, and least trouble to maintain of any in the market.

Patented Dec. 31, 1872.

ALSO, SOLE MANUFACTURERS OF THE

Patent Circuit Closer Key,
O'Sullivan Self-closing Key,
Scott's Patent Hotel Annunciator

by which guests telegraph their wants to the clerk, and avoid waiting to have the boy come and see what is required.

ALSO, OF THE

PATENT BATTERY INSULATOR

shown, holdin a cup of the Baltimore Battery in the above cut, which most effectually insulates the Battery as the drip passes off *through a hole in the Insulator.*

The Electrician of the Western Union Telegraph Company, Mr. PRESCOTT, says of it:—"I think your Battery Insulator is very admirably adapted for the purpose designed, and it ought to receive general adoption."

Also, ELECTRIC GONGS of all sizes.
RAILROAD SIGNALS.
SWITCH BOARDS, any Pattern.
A CHEAP DIAL INSTRUMENT for Private Lines.
All kinds of BATTERY MATERIAL.
WIRES.—Rubber, Kerite, Silk and Cotton Covered Office—all Sizes.

Insulators.

BROOKS, SCREW GLASS, RUBBER HOOK.
CROSS ARMS, PINS, BRACKETS.
Repairers' Tools constantly on hand.
Importers and Dealers in best English and American Galvanized Wire.
MANIFOLD PAPER, for Train Orders, etc. Also, AGATE PENS.

In fact, everything used in connection with TELEGRAPH LINES we are prepared to furnish, and equip any length of line in the shortest possible time. Having our own Foundry, we can furnish Brass Castings of any description at moderate prices

OF EVERY DESCRIPTION,

38 Vesey Street, New York.

New and Superior patterns of

STANDARD TELEGRAPH INSTRUMENTS.

Their RELAYS, SOUNDERS, and KEYS which have been specially designed by Mr. F. L. Pope, are elegantly designed, thoroughly well finished and scientifically adapted to the service required and are recommended as SUPERIOR TO ANY HITHERTO OFFERED.

In addition to these ALL DESCRIPTIONS OF TELEGRAPH MATERIALS AND SUPPLIES are furnished, such as

INSULATORS, BATTERIES,
INSULATED WIRES,
CHEMICALS., ETC, ETC.

MAGNETIC AND DIAL INSTRUMENTS.

We have for sale also THE NONPAREIL TELEGRAPH INSTRUMENT for amateurs, learners and short lines.

A COMBINATION SET, comprising Sounder and Key on a handsome rosewood base.

Bradley's Box Relays and Sounders.

Bradley's Apparatus for Electrical Measurement.

Bradley's Naked Wire Helices and Magnet Spools to order.

any desired size and resistance, at manufacturers' lowest price.

Descriptive Circular and Price Lists forwarded upon application to

F. L. POPE & CO.,

P. O. Box 6010 *38 Vesey St., N. Y.*

THE LECLANCHE BATTERY CO.

Offer for Sale this celebrated Battery,

SECURED BY LETTERS PATENT,

Of which they are the exclusive owners in this country.

Over 300,000 are now in use in Europe,

and have recently been adopted by the French Government in preference to the Calland, which had been used by them for several years.

WE RECOMMEND THEM FOR

Telegraphy (open circuit), Railroad Signals, Hotel Annunciators, Burglar Alarms, Electric Bells, Clocks, &c.

AMONG ITS NUMEROUS ADVANTAGES ARE—

ABSENCE OF ACIDS AND SALTS OF COPPER,

ITS GREAT CLEANLINESS,

WONDERFUL DURABILITY,

ECONOMY IN RUNNING EXPENSES,

ENTIRE ABSENCE OF ODOR.

This Battery will last without any attention from six months to three years.

A large number of Cups are already in use in this country on Burglar Alarms, Electric Bells, &c., and are giving entire satisfaction. The Western Union has a number of Cups put up November 26th, 1872, that are still running.

For further particulars apply to

JOURNAL OF THE TELEGRAPH.

VOL. VI. NO. 17. NEW YORK, AUGUST 1, 1873. WHOLE NO. 138.

MULTIPLE TRANSMISSION BY THE SAME WIRE.

It has long been known to electricians that the capacity of the wires ordinarily used for telegraphic purposes was greatly in excess of the power or speed of the machinery which is used to operate them, and for many years efforts have been made to utilize these resources. From Gintl to Stearns the way is bridged with experiments, which have finally resulted in practically doubling the capacity of the wires by the duplex system. From Bain to Wheatstone there is a continued succession of endeavors to develop machinery capable of operating the wires by automatic processes to the fullest extent. In some degree the equivalent of an automatic system is that of M. Meyer, of the French Telegraph Administration, a description of which we find in the *Journal Telegraphique*. As will be seen from the following description, nothing which may strictly be termed as new, in a scientific aspect, is claimed, yet the experiment, in its success in utilizing the time which is lost in the working of a wire by a single operator, possesses novelty, and the machinery of transmission considerable merit.

This system of apparatus has for its end the utilization of all the currents which in a given time can be made to succeed each other in a wire, so that several operators, each sending twenty to thirty messages per hour, may transmit them upon the same wire.

The number of transmissions that a telegraph line will carry varies naturally with its conductibility. It is generally admitted that with a speed of twenty-five messages per hour, on a Morse instrument, about five emissions of the current occur per second. Consequently, n being the sum of the currents which in a second can succeed each other in a conductor, $\frac{n}{5}$ represents the number of receivers which it is possible to establish upon a single wire, or the number of operators that can work at the same time.

The apparatus as described, (Fig. 1.) is constructed for four transmissions and is worked by four operators. At a speed of 75 revolutions per minute, presenting four letters at each turn, it records 100 messages per hour with 20 emissions of the current per second. This is less than a maximum result, for experience has shown that telegraph lines can be worked at a much greater speed.

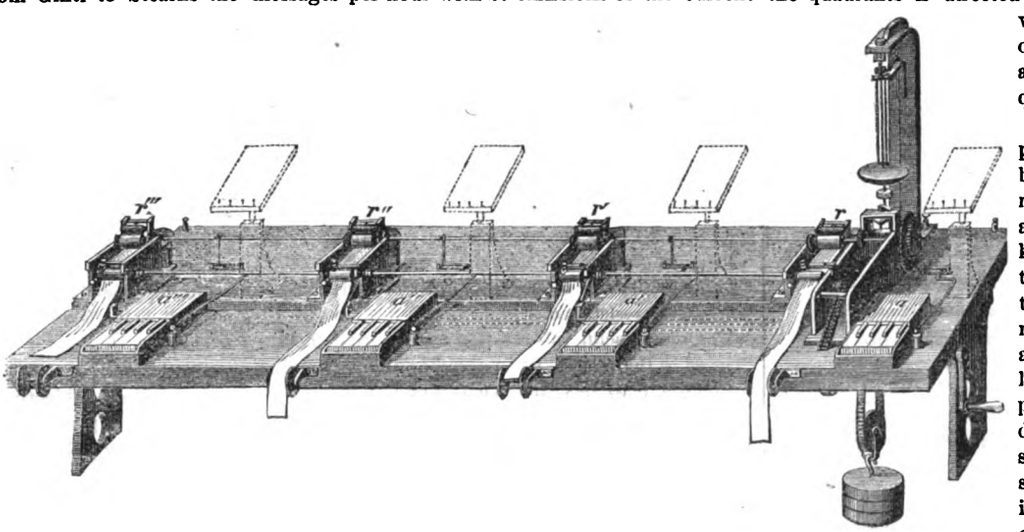

Fig. 1.

As the apparatus is arranged for transmission, four sets of keys, a a′ a″ a‴, eight in each set, are placed with their receivers r r′ r″ r‴ upon a table, each receiver having a strip of paper for recording which is continuously being drawn from a roll. A single clockwork movement, actuated by a weight and regulated by a conical pendulum, serves as the motor of all the receivers. The keys, as well as the receivers, are connected metallically to the earth-wire, and to the line-wire in the latter case, through the "distributor."

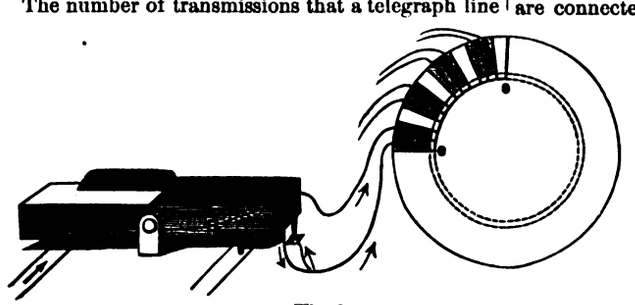

Fig. 2.

The distributor (Fig. 2.) is the principal feature of the instrument. It is this which, in four equal intervals of time, directs the current of the battery successively towards each of the four receivers of the receiving station; o o′ is a disc of metal, fixed and insulated. It has 48 divisions; 12 to the quarter of the circle, of which eight—grouped two and two—are connected metallically by eight wires to the eight contacts of the keys; the others, to the number of four, are permanently connected to the earth. There are, then, four cables of eight wires each which start from the four sets of keys and end in the distributor. The groups or divisions are therefore sixteen in number, separated by intervals. The first half of a group, 1-48th of a revolution, gives place to a short contact; the entire group to one of double the length.

An elastic spring or rubbing contact, mounted on the axis, traverses the circumference of the disc and puts successively the four keys and receivers into contact with the line, so that the current emitted or received during the passage of the spring over one of the quadrants is directed through the receiver to which it corresponds. Each operator thus has the line at his disposal during a quarter of a revolution.

The manipulator is composed of eight keys, four black and four white, connected between the battery and the earth. The black keys represent dots and the white dashes. In order to transmit a letter, as many keys, black or white, are touched simultaneously, as the letter to be produced has dots or dashes, taking care to start from the left key. As soon as the rotating spring, in its movement, passes over that section of the disc to which the keys depressed are connected, the signal or letter is transmitted, the spring passing to the next quarter section which is connected with the next set of keys, and which is being manipulated by another operator, and so on with all the sections. There is, in aid of sending, attached to each of the keys, an eccentric, the use of which is to raise after each letter a small rider, and this, falling by its own weight, produces a tick, beating the measure, during which each operator may work.

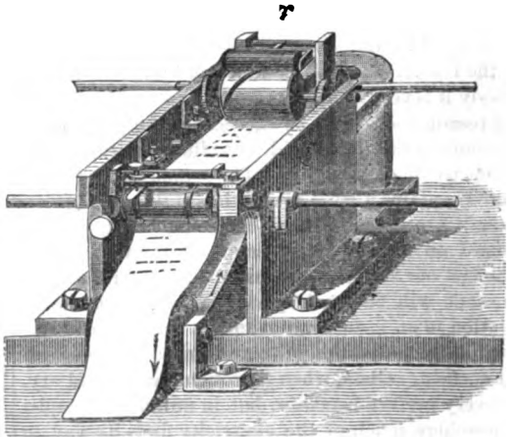

Fig. 3.

Figure 3 is an enlarged view of the receiver. Each receiver has for its printing mechanism the fraction of a helix, resembling an elongated spiral. This

Digitized by Google

may be more easily understood by supposing a cylinder having upon its surface a raised bead spirally over the entire length. As the contacts from the sets of keys are placed in a straight line over this cylinder, it will be plain that only one key can be put into connection with the spiral bead at the same time. The helix of the receiver and the rubbing-contact of the distributor make their revolutions in the same time and from the same starting point. An inking wheel revolves freely on each of the helices. The letters appear transversely upon the paper band (*i. e.*, at right angles to the ordinary Morse characters), the paper being raised to the writing-helix by the armature of the electro-magnet over which it passes. This transversal disposition of the letters presents a double advantage : it avoids confusion between consecutive letters, and reduces considerably the length of the paper band used for each dispatch.

The multiple transmission, then, depends upon the identical revolutions in the same time of certain portions of the apparatus at distant stations. This is effected by the aid of a conical pendulum and a regulating system, by which a correcting current is transmitted every second. Further, it is arranged that the line should be put to earth at both extremities after each emission of the current.

It will be seen that the multiple telegraph, arranged upon the best division of the time utilized by successive currents, has nothing in common with the system of double transmission.

THE RESISTANCE OF INSULATORS.

[From the London Telegraphic Journal.]

The resistance of the dielectric or insulator presents some of the most important problems of electro-telegraphy, and it will be impossible that we can exhaust their application until we have attained to some acquaintance with instrumental work. But there are general principles the knowlege of which will tend to the easier understanding of what we shall presently have to say. The specific resistance of insulators varies with every variation in their composition ; and as their composition is necessarily subject to many more variations than are likely to occur with a simple metal, such as copper, the tabulation of a series of resistances would be of little value to the student. Variation in the resistance will occur, too, through difference of age of the insulator, especially if this be india-rubber or gutta-percha ; and difference of temperature results in difference of resistance of insulators to a very large amount.

But were these causes of variation eliminated there would remain a very probable source of error in the difficulty of ascertaining how much electricity has passed by the surface moisture or dirt adhering to the insulator. This conduction by the surface of a body it is very difficult to avoid, and for the following reason :—There is an exceedingly large quantity of common salt (or chloride of sodium) floating about in fine particles, in the air. The perspiration of one's hands contains a large proportion of this ingredient. Now a great deal of this salt is deposited or condensed on the surface of any solid body (as those amongst our students who have worked with a spectroscope will be painfully aware), and as salt is, in relation to an insulator, not such a very bad conductor, a large proportion of the electricity escapes over the surface. Glass, when thoroughly warm and dry, is a very perfect insulator, but in ordinary or moist atmosphere much of the electricity finds its way to earth, and is lost. The ebonite or vulcanite insulators of electrical instruments are very quickly covered with such a conducting film, and Mr. Varley, who has studied the subject extensively, recommends the washing of the surface of the ebonite or vulcanite with very dilute sulphuric acid, then with water, rubbing until dry, when the surface may have solid paraffin rubbed over it.

The presence of this conducting film at once explains how preferable it is to reduce the extent of surface of an insulator, on the ground that by reducing the superficial area we reduce the liability of the electricity to escape. The glass insulators of our telegraph posts are constructed on the principle of exposing as little conducting surface as possible.

It should be remembered that, although there is much difference between what is generally termed a bad conductor and an insulator, the latter does not mean a substance giving infinite resistance, through which no electricity can pass, but simply a *very* bad conductor. Graphite and gas-coke are bad conductors, for their specific resistance is from 1,500 to 40,000 times that of pure copper. The resistance of gutta-percha, however, bears very little relation to this, as we may gather from the resistances of a cubic metre of various kinds of gutta-percha employed in the undermentioned cables :*

	B. A. Units of Resistance.
Red Sea	$0{\cdot}362 \times 10^{12}$†
Malta Alexandria	$1{\cdot}280 \times 10^{12}$
Persian Gulf	$1{\cdot}800 \times 10^{12}$
Atlantic (2nd)	$3{\cdot}420 \times 10^{12}$
Gutta-percha, at 24° C.	$3{\cdot}530 \times 10^{12}$

For the purpose of comparison it may be stated that the British Association unit of resistance would be measured by a conductor of pure mercury, 1 sq. millim. in section and 1.0486 metres long at o° C. Of course a cubic metre of copper would have no perceptible resistance.

The most useful information we can give the student as to the nature and character of the principal insulators, is to describe what they are, and, as far as known, the method of preparation :

India-rubber.—This well-known substance, sometimes called caoutchouc, is the dried juice of a tree, the trees yielding the juice being known botanically as of the orders *Urticæ*, *Euphorbiaceæ*, *Apocyneæ*, the product of the *Siphonia cahucu* (South American) and of the *Urceola elastica* (East Indies) being known commercially. The native incises the tree, and collects the exuding juice in vessels of dried clay, whence the product takes the form known as "bottle" rubber. The juice is solidified by the application either of artificial heat or of that of the sun ; in the latter case the product is known as "lard" gum or rubber. In this way we obtain the immense supply of india-rubber for our cables, the purposes of waterproofing, &c. ; as much as 120,000 cwts. having been produced in 1870, 60,000 cwts. of which came from the island of Java.

Pure india-rubber is white, and, when in thin sheets, semi-transparent. Its elasticity is perfect. It is non-fibrous, but it possesses the curious property of becoming somewhat fibrous and less transparent when excessively stretched. It is not brittle when cold, but becomes hard ; hot water and steam render it soft, but it suffers no chemical change from their action.

India-rubber is soluble in—

Alcohol-free ether,
Oils of caoutchouc,
" turpentine (with heat),
Sulphide of carbon,
Persian naptha,
Chloroform,
Benzoline.

It is insoluble in alcohol ; it is not decomposed by dilute acids or strong alkalies (strong acids readily decompose it). If a piece of india-rubber be stretched and then immersed in cold water, it looses some of its elasticity, which it regains when placed in water at 45°. It melts at 200°, and when ignited gives off a gas possessing high illuminating power.

The chemical formula of india-rubber is $C_4 H_7$, and 100 parts of this substance contains 87·5 parts of carbon and 12·5 of hydrogen.

The electrical resistance of india-rubber decreases with increase of temperature, but not so rapidly as with gutta-percha. Under pressure the resistance increases.

Vulcanite.—India-rubber immersed in molten sulphur becomes subject to several changes,—that is to say, it is vulcanized, and remains elastic (while india-rubber hardens) at very low temperatures. The solvents of india-rubber no longer act upon it. There are several methods of preparing vulcanite, the chief being the following :—Parke's method : The india-rubber is thrown into a mixture of 40 parts sulphide of carbon and 1 part chloride of sulphur, placed in a chamber heated to 21°. The sulphide of carbon is volatilized, and the vulcanized rubber is then washed, first with a dilute solution of caustic potash, and then with water. In Humphrey's method benzoline is substituted for the sulphide of carbon. Many other methods have been devised, but they have not met with extended use.

Ebonite.—Ebonite is vulcanized india-rubber hardened by the use of more sulphur (50 to 60 per cent.) and higher temperatures than are employed for vulcanite, together with the addition of gutta-percha, asphalte, pipe-clay, sulphide of zinc, &c. Ebonite is only slightly elastic.

Hooper's India-rubber.—The Hooper Company cover the wire of their cables, first with pure india-rubber ; then, subjecting the india-rubber coating to a vulcanizing process, the outside becomes hardened, and less susceptible to the action of sea-water than is pure rubber. This compound is much less liable to variation in resistance by increase of temperature than gutta-percha, as the following observed resistances will show :

Temperature.	Resistance.	
	Gutta-percha.	Hooper's Core.
0° C.	100·0	100·0
10° C.	28·9	58·8
20° C.	8·4	29·1
30° C.	2·9	16.7

Gutta-percha.—Like india-rubber, pure gutta-percha is quite white, and it is also the dried juice of a tree, the *Isonandra gutta*. The term "gutta-percha" is really derived from the Malay language, and signifies "Sumatra gum," the island of Sumatra being known as "Pulo-percha." Gutta-percha will bear great strain (1¼ tons to the square inch), and on this account, especially in a form modified by Mr. Willoughby Smith, has been more extensively employed for telegraphic insulation than any other material. Its solvents are—

Oil of turpentine (with heat),
Sulphide of carbon,
Chloroform,
Oil of caoutchouc,
Coal-tar oils.

It is insoluble in—

Water,
Dilute acids,
Alkalies,
Alcohol.

Gutta-percha and india-rubber absorb water, to the following amount, as given by Messrs. Clark and Sabine :—

	In Fresh Water.	In Salt Water.
	23·00 per cent.	3·0 per cent.
Unvulcanized	19·00 "	3·9 "
Vulcanized	10·14 "	2·9 "
Gutta-percha	1.50 "	1·0 "

* Taken from Prof. Jenkin's "Cantor Lectures."

† 10^{12} should be raised 10 raised to the 12th power, that is, one with 12 noughts after it, or a million times a million.

Digitized by Google

With regard to electrical resistance the effect of temperature is greater than with india-rubber, while the resistance increases to a considerable percentage under pressure.

Asphalte or Bitumen.—This substance is employed in the manufacture of cables, and is found as a natural product in various parts of the world. An artificial product termed asphalte is obtained from coal-tar, which is sometimes mixed with lime and sulphur. The natural product is also known as mineral pitch.

Clark's Compound.—This insulating material, for the outer casing of the iron sheathing of cables, is stated to be composed of five parts by weight of tar, 30 parts of silica, and 65 parts of mineral pitch.

Chatterton's Compound.—Is really a cement, used to lute together the coatings of gutta-percha upon a cable-conductor. It is composed of 3 parts by weight of gutta-percha, 1 part each of resin and Stockholm tar. The insulating power is much less than that of gutta-percha.

SOCIETY OF ENGINEERS.

At a late meeting of the Society of Engineers, Mr. J. H. Adams, Vice-President, in the chair, a paper was read on railway train intercommunication by Mr. S. A. Varley. The author, in the first place, sketched the history of the subject, and referred to the early introduction of electric systems as a means of communication between passengers and guards. The cord system, it was stated, had been in operation for about four years, but had failed, the difficulties attending its use and the cause of its failure being explained by the author, who pointed out the advantages of the electric system for signaling in railway trains. He next laid down six conditions which electric signals ought to fulfill, and then proceeded to describe in detail the systems of Mr. Preece and Mr. Walker, and his own, as used on the royal train, pointing out the merits and demerits of each system. The paper was illustrated by means of signaling apparatus, arranged on a model train of three carriages and two guards' vans, the electrical apparatus and couplings being full size, and which was worked by Mr. Varley. The subject was well discussed by the meeting, there being a number of telegraphic engineers, electricians, and others interested in the question, present. The opinion generally expressed was that, sooner or later, the electric system of signaling on railway trains would be adopted.

Researches on the Electricity Produced in Mechanical Actions.—*M. Joulin.*—Induced by observations of the electrical phenomena produced in belts for the transmission of motion, M. Joulin constructed new electric machines in order to study such phenomena, consisting each of a belt and two pulleys. For the pulleys he used cast-iron, copper, zinc, wood, leather, hardened caoutchouc, wool and silk. For the belt, leather differently prepared, having a purverulent coating of talc, resin or oxides, or a coating of wool, silk or gutta percha. The maximum velocity of the belt was 1,200 metres; the maximum tension weight 300 kilogrms. The motor pulley rested on fixed, the other on sliding, supports. M. Joulin observed the points at which a metallic sphere, with fine needle attached, brought near the system first became luminous in the dark; and these points, taken together, gave surfaces of equal potential. He states the results for conducting and for non-conducting pulleys, and indicates how the permanent electric state is established in the machine. He finds that the free electricity perceived is the dynamical charge accompanying a current which is propagated through the belt—a charge which, according to Ohm's law, decreases from one extremity to the other, of the belt, as the ordinates of a trapezium for conducting pulleys and those of two similar triangles for non-conducting pulleys.

ON COMPOSITE ELECTRIC SPARKS.

Note by M. A. Cazin.

I term *composite sparks* those sparks with several branches which we frequently perceive with the Ruhmkorff coil, especially when the poles of the coil communicate with the armatures of a condenser, or as took place in the recent experiments made by M. Guillemin, with large metallic surfaces separated from one another. I have discovered that the sparks which compose the bundle are successive, and I have seen their number attain several hundreds by the simple approximation of the electrodes. Here is the principle of my experimental method: The spark burst in the focus of a collimator on the edge of a disc revolving around its centre. This disc is opaque, and divided into equal parts by lines. From the other side of the disc, and in the passage of the luminous rays of the spark, is fixed a pierced screen, the opening of which is equal in width to a division of the revolving disc. This opening is watched with the glass of a cathetometer, and when a single spark bursts in the focus of the collimator there appears in the field of the glass only a single line of the revolving disc; but when the spark is composite the line is perceived to move in into the various positions which it occupies at the time of discharge of the simple sparks which go to compose the total discharge. I will describe one of my experiments: The electrodes consist of two platinum buttons of 7 m.m. diameter, their distance being measured by the aid of a micrometer. The disc is 22 c.m. in diameter, and bears 48 divisions. It is rotated by a Froment's electromagnetic engine, and makes 38·78 turns per minute, the length of passage of a line being 0·0322 second. The poles of the induction coil are put into communication with the buttons of the discharger, and with the extreme armatures of a cascade of three jars. The circuit is opened and closed by hand. Here is a series of observations made at the opening of the circuit:

Distance of Electrodes. m.m.	*Observed Effect.*	*Duration of total Discharge. Second.*
7·00	No spark	—
6·00	A brilliant flash	—
5·00	Do.	—
4·00	2 flashes	0·002
3·00	3 flashes	0·003
2·00	5 to 6 flashes	0·008
1·46	10 flashes	0·011
0·62	Numerous flashes	0·016
0·21	Still more numerous	0·024

An analogous experiment with another disc led me to observe 500 sparks, but in the last two experiments given above the sparks were too numerous to count. We may conclude, from these experiments, that whilst the distance of the electrodes decreases, the number of successive sparks which compose a discharge increases gradually to several hundreds. These experiments are analogous to those which M. Nyland made upon the mechanical effect of the discharge of an induction coil whilst it traverses a moving strip of paper. He counted a great number of successive holes, which appear to me to correspond to the successive sparks constituting a composite spark. There is, however, a considerable difference. M. Nyland obtained a considerable number of holes with the direct spark from the bobbin, without the Leyden jar. With me, in this case, the sparks are always simple. I purpose continuing this subject, which may furnish something interesting to the theory of electricity.

THE EAGLES METALLIC BATTERY.

This battery, a modification of the Daniell, in some respects differs from any galvanic battery before known. The elements employed are very simple, the only chemical required to be used being sulphate of copper. One peculiarity of this battery is, that the cell itself, instead of, as in most other batteries for telegraphic purposes, being of glass, is made of *lead*, and at the same time forms the negative pole of the battery.

In setting up or preparing this battery it is only necessary to put into the lead cells a quantity of sulphate of copper (five pounds of which to each cell is found in practice to be advantageous). Over the sulphate of copper a layer of sawdust about an inch thick should be placed, and the zinc set upon the sawdust, then a sufficient quantity of water to cover the whole is poured into the cell. After standing in closed circuit for a few hours the battery will develop its strength, and is ready for use. If it is desired to obtain immediate action a solution of sulphate of zinc should be used instead of water. To prevent or retard evaporation oil may be poured upon the surface of the fluid. It is claimed that cells prepared in this way will continue in action for six months or more without renewal or any attention whatever.

The electro-motive force of the cells of this battery is, of course, the same as that of the Daniell or any form of sulphate of copper element; but, unlike them, the internal resistance is very low, consequently a proportionately greater amount of electricity is evolved in a given time. The internal resistance may be varied, to suit circumstances, from below one ohm up to five ohms or more, by varying the thickness of the sawdust layer from one to five inches. From one to five inches is usually about right for a local sounder.

THE ARIZONA TELEGRAPH EXTENSION.

In relation to the Government military line about to be constructed in Arizona Territory, the *Arizona Citizen* of June 21st, says:

"Mr. R. B. Haines, District Superintendent of the Western Union Telegraph Company, ought now to be in Arizona to superintend the construction of the military telegraph from Prescott to Tucson. He arrived at Los Angeles on the 11th instant, and carried with him official instructions to report to the chief quartermaster of Arizona, which he intended to do after a day or two with his family in Los Angeles. The wire, insulators, batteries, &c., are now on the way to Yuma, by the steamer Newbern."

The Prescott, A. T., *Miner*, of the same date, says: "The latest report concerning the proposed telegraph line from Prescott to Tucson is that troops will have to cut the poles, and do all the work, under the direction of Captain George F. Price. This, we learn, is what General Dana has said."

The Shah probably never presented so gorgeous an appearance as on the night of the concert at the Albert Hall, when, suddenly and simultaneously, five electric lights were reflected upon the group of which he was the centre. Each light was the result of fifty Grove's cells, making a total of 250, placed on the balcony outside the building, whence wires were led to the carbon points inside, under the care of Messrs. Tisley and Spiller. The whole of the glare from the five lamps was concentrated upon the dais, where the effect produced can only be imagined by those who have seen diamonds illuminated by the same intense light. The Shah is said to have been highly delighted with the brilliant spectacle, and certainly the spectators were, as well as interested at seeing the Princess of Wales explaining the details to his Majesty.

CORRESPONDENCE.

SAN FRANCISCO, CAL., June 28, 1873.

To the Editor of the Journal of the Telegraph:

I have read with interest the correspondence in JOURNAL OF THE TELEGRAPH relating to a change of alphabet; and since a pretty free discussion is allowed, with your permission I will add an idea or two of my own. I have but little sympathy, or even patience, with the petty jealousy which would exclude an alphabet, if clearly proved to be better than the one now in use on this Continent, through fear of cheap competition. That idea is unworthy of telegraphers as a body; nor do I believe that even a respectable minority would allow themselves to adopt such a course of reasoning. The majority of telegraphers surely have too much good sense not to perceive that their standing and remuneration depend on their real worth, not on any foolish attempts to throw obstacles in the way of those honestly seeking to qualify themselves for the profession. Nor can I, while liking the spirit of your correspondent, X. Y. Z. in the JOURNAL of June 2d, quite agree with him in the opinion that "operators, chief operators, managers and superintendents, are almost a unit against the change." True, a majority of those who have so far spoken through the columns of the JOURNAL OF THE TELEGRAPH, have been adverse to any change, or rather, I should say, adverse to exchanging the Morse for the Continental alphabet; but that a majority of experienced and thoughtful operators and electricians are adverse to any change of alphabet, I am by no means certain. It must be borne in mind that those who are best fitted to give an intelligent opinion, are not always the first to express their views; and they may be the more backward about volunteering their advice in the present instance, from an appreciation of the immense effect, for good or evil, which any change must necessarily produce. Any change which, in the present state of telegraph, is deliberately and advisedly made, will probably result in an alphabet which will last for generations, and if an alphabet better or worse than the one now in use, "by the twentieth part of one poor scruple," be adopted, the effect, though slight as regards any single individual, when multiplied by the great and increasing number of operators, will be seen to be such that the boldest may well pause before taking hasty steps.

The first thing to be considered is whether any change is desirable; and if this is answered in the affirmative, then it seems to me that the only consideration for Americans, is to determine upon the best alphabet, without regard to any now in use. We can well understand why it should be desirable for England, which, by a large number of wires, is in direct communication with the continent of Europe, to have the European alphabet; but her case can never have a parallel with us, and it is our concern to see that we have a uniform alphabet throughout America, best adapted to the English language.

Now it seems to be the general opinion that some change, particularly in regard to the spaced letters, is desirable. How shall this change be made? Can there be any better or more satisfactory manner, than by the directors of the most important companies in the United States appointing some of their best operators and electricians to meet in Congress, and after a full interchange of views commensurate with the importance of the subject, to determine upon an alphabet? Then let the alphabet be submitted to the great body of telegraphers, with an invitation to subject it to the severest tests in actual use on the wires, and to report what may seem to be defects. Especially let them note any combinations which may tend to produce "bulls." At the end of a reasonable time—say six months—let the telegraphic Congress again meet to revise its work. In this manner, I doubt not that we should have an alphabet which for rapidity and freedom from combinations liable to produce error, would command the confidence and approbation of all telegraphers.

We can see that while the general rule would be that the letters most often used should be represented by the shortest combinations, yet this must always give way whenever it would lead to combinations liable to errors. It might possibly be shown, also, that some of the letters most frequently used, would be read by operators with greater ease if the *very shortest* combinations were not used. Certainly, the ease with which the ear can catch any particular combination is a very important consideration. If a message can be received in sixty seconds with one alphabet, and there is any greater ease and certainty in another alphabet which requires sixty-one seconds, the latter might be preferable; speed within certain limits being subordinate to ease and security. To properly balance and give due weight to these considerations of certainty, speed and comfort, requires good judgment and scientific knowledge, guided by practical experience, and makes the combined wisdom of a Congress so manifestly superior to the judgment of any single individual, that it seems like presumption for any one operator to attempt to decide upon any single letter, much less upon an alphabet.

To accomodate railroad lines, and perhaps all lines, how would it do to select to represent figures the best combinations, regardless of their being already used for letters, and when an operator has occasion to send figures, let him prefix them with the letters "fi"? I believe this has been to some extent tried in England, and with satisfactory results.

A.

GLENDALE, June 30, 1873.

To the Editor of the Journal of the Telegraph:

Although there has been much space in your valuble columns already taken up in discussing the proposed adoption of the "Continental alphabet," I would like to say a word in favor of disposing of the spaced letters, or at least some of them. From the temper of the correspondence, so far, it is quite evident that, as a class, the operators do not take kindly to the "Continental," or will never favor its adoption unless forced to do so, although nearly all admit that the spaced letters are very objectionable, and are the cause of numerous errors. To get relief from the spaced letters, I think Mr. Geo. T. Williams' suggestion, that we abolish the character . ..., a good one (would be better if ... . was coupled with it also). I think this change would not be resisted on the part of the operators, if some short combination was substituted in their places. And when once operators got familiar with the new characters, take C, O, R and T, which latter has to be guessed at often, and change them, too, leaving the balance of Morse alphabet as it is, it being very questionable whether the Continental is any improvement upon the Morse, with the exceptions named, even if it has been arranged scientifically and systematically by German savants to suit the German language, the different letters not being used in the same proportion in making words in the English and German languages, by any means. I hope this discussion will be kept up until we are relieved from the responsibility of guessing out messages transmitted in uncertain characters.

H. E. WILLIS.

PRINCETON, N. J., July 19, 1873.

To the Editor of the Journal of the Telegraph:

I was fortunate enough to see Mr. Varley's first letter regarding the proposed change of alphabet, in an old number of the JOURNAL, and I have read the later correspondence on the subject with a great deal of interest. Having been a practical operator on nearly all the old systems on the other side, I wish to say a little about the subject. It seems to me one great fact is purposely eluded by Messrs. Varley & Culley, namely, that there were in practical operation in all the principal offices on the other side for many years, three different systems of telegraph—the dot and dash of the Morse, the right and left movement of the single needle, and the double needle. Nearly all the operators could work these three different systems, because each of them presented ideas to the mind as different as one language is to another. I have worked a railroad repeating office by myself with these three systems in use, could pass from one instrument to the other. It was very easy for Mr. Culley to issue orders for a change in the Morse code, there being other systems to fall back on while we were learning the new code. Here you have only one system in use, and I can't understand how the change is to be brought about unless on some plan similar to the following.

Suppose I can converse fluently in a foreign language, and I am desired to change the sound of some letters, and exchange the sound of others crosswise, and while I am making this great movement I am supposed to carry on my conversation in that language without cessation. I should think my brain would be in a queer state. You will find from Mr. Culley's letter that he admits all these systems were working on the other side, but I can't make out why nobody has yet noticed that the English had older and totally different codes to work while they were learning Morse, or substituting the Continental for the American code.

J. D.

BALDWYN, Miss., July 9th, 1873.

To the Editor of the Journal of the Telegraph:

If you will admit a brief opinion on the "much ado" subject of changing the Morse alphabet, I will consider myself highly honored, as this is my first to the JOURNAL.

I would say that the only change that I see necessary is to abandon our "&," which is so frequently "bulled" for "E. S.," and write it out in letters—"*and*." This is a source of almost inevitable error. With this change I think our alphabet will be unexceptionable, and there will be no excuse for error when care is exercised and the letters properly made.

T. P. S.

To the Editor of the Journal of the Telegraph:

Since the publication of the International Alphabet every successive issue of the JOURNAL has had a number of articles, *pro* and *con*, with regard thereto. I will venture the opinion that there is scarcely an attentive operator who has not already become familiar with the foreign characters. I can perceive no reason as yet advanced why the mystic language should not be universal, if the interests of telegraphy will be subserved thereby. It is true our tongue was first spoken, but we had dialects even among us which have been absorbed; and in view of the fact that we are rapidly approaching the epoch of a cosmopolitan or homogeneous condition, I think we should manifest our national progressiveness by the adoption of the few transposed foreign characters.

Digitized by Google

To the Editor of the Journal of the Telegraph:

There is fear of precipitate action on the alphabet matter. Though I am not intimate at inner circles, don't know members of executive committee, nor any one who knows the future, yet I have the satisfaction of feeling that the W. U. will not decide without a little convention. I think they will consult some of our ablest practical operators, with a view to finding what is best to do to lesson errors. It is unprofitable for some folks that the directors, executive committee and most of the stockholders *are not active, practical* telegraphers, employés at the key, the counter or elsewhere. Since they are not, the next best thing is to consult with a goodly number of actual employés—those who have no axes to grind, and such as hold their position more on account of their skill than from any personal preferment. There are plenty of men just fitted to help the Company out of any dilemma—men who are not only able to recognize merit and detect demerit in new ideas, but are able to conceive and execute better ones, or to substitute good points where bad exist in new propositions. It would be short-sighted in proprietors to push ahead without questioning their engineers; and I cannot for a moment believe that in this matter the Company will take a single step without a full, searching examination of the whole subject by and with those who alone can shed all the true light upon it, so far as feasibility in its operation is concerned.

It is a melancholy fact that our best practical electricians, systematizers and managers are not always the men who fill those places; but this fact *need* not deprive the Company of the use of the best brains in its employ. I know that propriety might seem violated should any employés below district superintendents be consulted when the time comes to decide.

I do not consider much of the correspondence published as entitled to a feather's weight. The men of real deep thought are slow to speak, and they seldom or never publish their views. They hardly give an opinion as to expediency, even when asked. They never thrust forth their personal views unasked.

Now, having expressed what I know many feel and fully appreciate, I hopefully close.

TORTOISE.

GENESEO, N. Y., July, 1873.

To the Editor of the Journal of the Telegraph:

I have been exceedingly interested in the letters which you have been publishing from time to time in regard to a proposed change of alphabet. I do not lay claim to being an operator of great skill, nor shall I, perhaps, ever become such, yet I cannot refrain from expressing my humble opinions upon this subject, fraught with great importance to every American telegraph operator. Now, in the first place, it is undoubtedly true that we, as the greatest and most enterprising business people of the globe, should have in practical use the most perfect alphabet for the transmission of telegrams that human ingenuity can devise, and the fact that the alphabetical characters now in use by us have been used for many years should not deter us from instituting a change for the better; but in this connection there are two important matters for consideration, viz.: Since the invention of the "mighty telegraph," up to the present era of its history, what person or persons have been, or now are, the most likely to prepare for us the most perfect alphabet possible? It seems to me there can be but one answer to this inquiry—Morse. I believe the author of our alphabet conceived, by means of patient study, a correct idea of the most perfect combination of characters to represent upon the wires our English language that ever has or ever will be invented. Realizing, as he must certainly have done, the great necessity of producing an alphabet that need never be changed while the affairs of this mundane sphere should be conducted by telegraph, it is but natural to suppose that he exerted the faculties of his God-given genius towards bringing out, for the permanent use of unborn thousands of telegraph manipulators, a perfect alphabet.

The second consideration is this: If the time has really come when a universal belief prevails that the Morse alphabet is too imperfect for practical use, what shall we have in its place? Shall we accept the European method, which is, to all appearance, vastly more awkward, and equally prolific of errors, and to adopt which seems like taking a step backward instead of forward, or shall we look to the "coming man" for a new alphabet?

I am glad to believe that much as has been said and written upon this subject, a change will never be made, unless after the most careful investigation by the best minds giving their attention to telegraphy. It should be deemed the part of wisdom to effect such a change.

Those who will closely study the Morse characters will observe a similarity between each character representing a given English letter, and the shape of that letter when printed or written, and also its sound upon the instrument. To illustrate, what character, or combination of characters, could possibly better represent the letter *E*, as it appears to our eyes in the English, or sounds to our ears upon an instrument, than the one Morse has given us? And the same resemblance may be traced throughout the whole alphabet.

Our alphabet, as a whole, is possessed of more smoothness, more music, more rhythm, and more beauty than any which ever has or probably ever will be arranged, and because errors sometimes occur in its use nothing to the contrary is thereby proven.

I submit these opinions in the utmost humility, being, as I have said, but an humble proficient in, though an earnest lover of, our beautiful art.

H. F. PEET.

To the Editor of the Journal of the Telegraph:

From personal experience and a careful observance of the articles which have appeared in the JOURNAL, I find that the spaced letters are all that is objectionable in our present alphabet, and to remedy this defect we have but to substitute *new* characters for those now representing E and I, then the balance cannot be mistaken.

BALTIMORE, June 10th, 1873.

To the Editor of the Journal of the Telegraph:

Taking advantage of your expressed desire that all members of the Insurance Association should give their views on the subject of the $1,000 policy, to be paid irrespective of the number of members, I beg leave to submit the following as the opinion of quite a number of the members in this city.

They approve entirely of giving a fixed sum to each member's heirs at death of member, but from the fact of the membership now being so large and steadily increasing, we propose that the amount be made $1,200.

This amount will still leave such a surplus in the Association from each assessment, that the object of making the stated amount payable occasionally without an additional assessment being necessary to meet the loss.

Hoping some one, with abler pen, may follow with stronger argument.

BALTIMOREAN.

To the Editor of the Journal of the Telegraph:

A party steps off the train and hands to a man on platform a message, accompanied with thirty cents, requesting him to hand to operator. Message and money are duly handed me, and upon examination of Tariff I find the rate to be seventy-five cents. Now what am I to do? The party sending message has got on the train and left, and an entire stranger to me, consequently I can't *safely* send the message collect. Please answer through JOURNAL, and oblige.

MANAGER.

Answer.—You cannot send the message. The money and message should be returned to the person who handed the message in.

S. C.—A first-class operator should be able to receive at least thirty words per minute by sound, and transcribe it legibly. He should be able to transmit forty words per minute, in a clear and distinct manner. He should also understand the formation and care of batteries, running of wire connections, and possess a general knowledge of the proper conduct of the service. These qualifications, combined with judgment and good temper, are the principal requirements to constitute a good operator.

Frank Dickinson.—There are seven words in "Look for pocket book left under pillow."

Valparaiso.—If a message is handed in, to be sent collect, which is an answer to one received three or four days previously, a guarantee should be required of the sender.

Operator.—There are thirteen words in "Stop shipments to P. & E. C. Co., Waverly pockets, until further notice."

X—There are eight words in "J. L. Smith will be here at noon." How any one could, as you say, count it six, is beyond our comprehension.

Inexperience.—Exactly so.

D. D. S.—Your inquiry is not clear.

IN execution of a convention recently signed by Lieutenant-Colonel Maxse, Governor of the Island of Heligoland, on the part of the British Government and Senate of Hamburg, a telegraphic cable has been laid from the above-named island to the station at Cuxhaven, at the mouth of the Elbe, and is now open for public traffic. Some ten or twelve years ago a cable was laid from the coast of Norfolk to Heligoland by the Submarine Telegraph Company, but it was soon broken or cut through, and never repaired. It was said at the time that the inhabitants of the island, who live upon shipwrecks, were systematically opposed to the innovation of interfering with what they consider their vested rights, and that they do so may be gathered from the fact that in their church prayers are publicly offered up every Sunday to the Almighty to bless their rocky coast with shipwreck. It is a great question whether this barbarous custom is continued at the present day with the knowledge and consent of the British Government. Let us hope that it is not.

BORN.

BELL.—At Reno, Nevada, July 8, 1873, to Frank Bell, Supt. W. U. Tel. Co., a daughter.

MARRIED.

GATES—DANIELS.—July 14, 1873, at the residence of the bride's parents, by Rev. M. B. Benton, A. Wesley Gates, of Andover, Ohio, to Miss Virtue A. Daniels, of Chautauqua, N. Y.

PRIDDY—MCGEE.—July 16, 1873, at the residence of the bride's mother, Charles W. Priddy, Manager W. U. Tel. Office, Bartlett, Tenn., to Miss Bettie McGee, of Bartlett.

DIED.

FOWLER.—At Dubuque, Iowa, July 21, 1873, after a short illness, Robert S. Fowler, Supt. Telegraph.

Digitized by Google

TARIFF BUREAU.

SEMI-MONTHLY CIRCULAR.

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
145 Broadway, New York,
August 1, 1873.

To all Offices on W. U. Lines:

The following changes and additions have been made since the date of the last circular:

GENERAL INFORMATION.

Gainsville, Ala., closed.
Loachapoka, Ala., closed.
Kirkwood, Del., re-opened.
Middletown, Ill., changed to Middleport.
Tamaroa, Ill., re-opened.
Otterbien, Ind., re-opened, square 289.
Blue Rapids, Ks., closed.
Bosland, Ks., P. O. A. is Wilson, Ks.
Centralia, Ks., closed.
Effingham, Ks., closed.
Frankfort, Ks., closed.
Irving, Ks., closed.
Kingsville, Ks., re-opened.
Muscotah, Ks., closed.
Netawaka, Ks., closed.
Wetmore, Ks., closed.
Waterville, Ks., closed.

There is now a W. U. office at Riverton, Ky., square 203; check direct.

Messages for Weymouth and South Weymouth, Mass., offices closed in last JOURNAL, can be mailed or delivered by special messenger from Boston, Mass.; if by latter, $1.50 for delivery should be collected.

Mackinaw City, Mich., re-opened, square 127.

Hereafter the "Tariff for Other Lines" to Lake Crystal, La Sueur, Mankato, Ottawa and St. Peter, Minn., will be 125 and 8 from Chicago, Ill.

Booneville, Miss., closed.

Northumberland, N. H., changed to Groveton. Business for Northumberland can be mailed at Groveton, N. H., or delivered by special messenger; charges for latter, $1.25.

Tamworth, N. H., closed.

West Ossipee, N. H., is now a W. U. office, square 20; check direct.

Three Bridges, N. J., closed.

Middlefield, N. Y., closed.

Hereafter the "Tariff for Other Lines" from Syracuse, N. Y., to Parish, N. Y., will be 25 and 2.

The P. O. A. of Palestine, O., is East Palestine, Columbiana Co.

Ava., O., closed.

Haverhill, O., closed. Messages can be delivered from Riverton, Ky.; charges for delivery, 25 cents.

Trout Run, Pa., is now a W. U. office, square 93; check direct.

The office at Williamstown, Pa., will hereafter be checked direct, square 76.

Rutherford, Tenn., closed.

Jacksonville, Texas, re-opened, square 480.

Honey Grove, Texas, closed.

The "Tariff for Other Lines" for offices in Utah, given below, will be as follows:

Almy	55	4	Ogden, U.	
	100	7	Laramie City, Wy.	
Castle Rock	55	4	Ogden, U.	
	100	7	Laramie City, Wy.	
Echo	55	4	Ogden, U.	
	100	7	Laramie City, Wy.	
Uintah	30	2	Ogden, U.	
	100	7	Laramie City, Wy.	
Weber	50	3	Ogden, U.	
	100	7	Laramie City, Wy.	
Wasatch	55	4	Ogden, U.	
	100	7	Laramie City, Wy.	

Hereafter the "Tariff for Other Lines" for the following offices in Vermont, given below, will be as indicated:

Bakersfield	25	3	27	St. Johnsbury, Vt.
	30	2	38	Swanton, Vt.
East Hardwick	30	2	27	St. Johnsbury, Vt.
	35	3	38	Swanton, Vt.
Hyde Park	30	2	27	St. Johnsbury, Vt.
	35	3	38	Swanton, Vt.
Johnson	35	3	27	St. Johnsbury, Vt.
			38	Swanton, Vt.
Morrisville	30	2	27	St. Johnsbury, Vt.
	35	3	38	Swanton, Vt.
Walcott	30	2	27	St. Johnsbury, Vt.
	35	3	38	Swanton, Vt.

So. Hardwick, Vt., changed to Hardwick. "Tariff for Other Lines" 30 2 from St. Johnsbury, Vt., and 35 3 from Swanton, Vt.

Capon Springs, Va., re-opened: tariff 25 cents more than Winchester, Va.; check direct,

Bryan, Wy., is now an Other Line office. "Tariff for Other Lines" 75 5 from Ogden, U., and 100 7 from Laramie City, Wy.

The following is a revised list of Other Line offices in Wy., with "tariff for Other Lines" from Ogden, U., and Laramie City, Wy.:

Aspen	75	5	Ogden, U.
	100	7	Laramie City, Wy.
Bridger	75	5	Ogden, U.
	100	7	Laramie City, Wy.
Black Buttes	100	7	Ogden, U. / Laramie City, Wy.
Bitter Creek	100	7	Ogden, U.
	75	5	Laramie City, Wy.
Coopers Lake	125	8	Ogden, U.
	40	3	Laramie City, Wy.
Como	125	8	Ogden, U.
	55	4	Laramie City, Wy.
Creston	100	7	Ogden, U.
	75	5	Laramie City, Wy.
Church Buttes	75	5	Ogden, U.
	100	7	Laramie City, Wy.
Carter	75	7	Ogden, U.
	100	7	Laramie City, Wy.
Evanston	55	4	Ogden, U.
	100	7	Laramie City, Wy.
Fort Steele	100	7	Ogden, U.
	55	4	Laramie City, Wy.
Granger	75	5	Ogden, U.
	100	7	Laramie City, Wy.
Green River	100	7	Ogden, U. / Laramie City, Wy.
Lookout	125	8	Ogden, U.
	45	3	Laramie City, Wy.
Medicine Bow	100	7	Ogden, U.
	55	4	Laramie City, Wy.
Percy	100	7	Ogden, U.
	55	4	Laramie City, Wy.
Point of Rocks	100	7	Ogden, U. / Laramie City, Wy.
Piedmont	75	5	Ogden, U.
	100	7	Laramie City, Wy.
Rock Springs	100	7	Ogden, U. / Laramie City, Wy.
Red Desert	100	7	Ogden, U.
	75	5	Laramie City, Wy.
Rawlins	100	7	Ogden, U.
	55	4	Laramie City, Wy.
Rock Creek	125	8	Ogden, U.
	55	4	Laramie City, Wy.
St. Mary's	100	7	Ogden, U.
	55	4	Laramie City, Wy.
Separation	100	7	Ogden, U.
	75	5	Laramie City, Wy.
Salt Wells	100	7	Ogden, U. / Laramie City, Wy.
Table Rock	100	7	Ogden, U.
	75	5	Laramie City, Wy.
Wyoming	125	8	Ogden, U.
	30	2	Laramie City, Wy.
Washakie	100	7	Ogden, U.
	75	5	Laramie City, Wy.

NEW OFFICES.

293 Hillsboro, Ala.
294 Shelby Springs, Ala.

ATLANTIC CABLE BUSINESS.

We are notified that the Hong Kong and Shanghai and the Shanghai and Nagasaki cables are broken. Messages for Shanghai should be posted at Hong Kong, and those for Nagasaki can be sent via Siberia.

Code and Cypher messages can again be acccpted from private persons for places in the Ottoman Empire.

The following typographical errors occur in Supplement No. 3, page 10, column headed "For 20 words or less."

"7.50" opposite "10 words or under," should be erased.
"Alexandria via. Malta," should be 7.50.
"Cairo and Suez via. Malta," 8.50.
"8.50," opposite France should be erased.

WILLIAM ORTON, President.

TRANSFER SERVICE.

EXECUTIVE OFFICE,
NEW YORK, July 22nd, 1873.

On and after August 1st, 1873, Mr. Leonard Cox will take charge of the Transfer Bureau in New York, previously assigned to Mr. I. C. Hendrickson, and transfers after that date will be addressed accordingly.

GEO. H. MUMFORD,
Vice-President.

EXECUTIVE OFFICE,
NEW YORK, July 24th, 1873.

From and after August 4th, 1873, money order offices will be established at the following named points in S. B. Gifford's district:

Brockport,	N. Y.,	Herkimer,	N. Y.,	Port Byron,	N. Y.	
Clifton Springs,	"	Homer,	"	Richfield Springs,	"	
Fayetteville,	"	Le Roy,	"	Tonawanda,	"	
Fonda,	"	Mohawk,	"	Trumansburg,	"	
Fort Plain,	"	Newark,	"	Union Springs,	"	
Gloversville,	"	Niagara Falls,	"	Waterville,	"	
Hamilton,	"	N. Y. Mills,	"	Watkins,	"	
Havana,	"	Palmyra,	"	Weedsport,	"	
		Penn Yan,	"			

G. H. MUMFORD,
Vice President.

On and after August 1, 1873, all communications for W. B. Hibbard, Supt. Third District, Central Division, should be addressed to him at Salt Lake City, Utah, instead of, as heretofore, Omaha, Neb.

We occasionally receive letters containing money that have no signature or certificate number to indicate from whom they come. The post-mark in such cases is our only clue. Last week we received three dollars enclosed in an envelope with the words "Kansas Pacific Railway" printed on the outside. There was no post-mark, name, or number. Who sent it?

The British Parliament has voted down a resolution of censure upon Mr. Scudamore for misappropriating public funds.

FOREIGN TELEGRAPHIC ITEMS

THE TELEGRAPH IN JAPAN.

The work of telegraphic construction in Japan did not fairly commence till the beginning of 1872. Since then two lines, extending from Tokei (Yedo) to Nagasaki, have been run, a distance of a little over 800 miles. There are twenty stations upon the first wire constructed, embracing the most important places in Japan. Three transmissions or repetitions are required. The second wire, which was completed last spring, is used only for treaty ports, and will be used principally for international work.

In the metropolis (Tokei) twelve local stations have been opened, the wires being principally supported upon iron poles, on account of the many severe fires in the city. The instruments used consist of Siemen's ink writer and the Breguet dial instruments, the Japanese characters being telegraphed by means of a style of writing that comprehends the whole of the Chinese characters—letters—and containing forty-seven signs, called the Katakana. The Morse system has been modified to represent the forty-seven characters.

The Imperial mint at Osaka is connected with the principal or head office in that city.

THE ATLANTIC CABLES AMALGAMATION.

The amalgamation of the Anglo-American, the French Atlantic and the Newfoundland Telegraph Companies is now completed, all the agreements having been duly executed. Of the late directors of the French Atlantic Campany, Viscount Monck, Lord William Hay, Baron Reuter, Baron Emil d'Erlanger, the Marquis de Beaumont, Mr. C. Crapelet and Mr. Edward J. Halsey have been elected upon the Board of the Anglo Company, with Mr. Cyrus Field and Sir James Anderson, late directors of the Newfoundland Company. The transfer books of the Anglo-American Company were to be closed on the 1st of July, for the purpose of allotting the bonus stock, which will carry dividend from the 1st May; the books of the Newfoundland Company are closed, and will not be re-opened, and the liquidation of the French Company will proceed rapidly. The result of the distribution of the increased stock will be that the Anglo Company's shareholders will receive about £152 for each £100, and the French shareholders about £180 for each £100, plus the cash distribution, equal at least to 8s. a share, which, together with the quarterly interim dividend of the 1st of May last, will represent a payment for the first four months of the year at the rate of 12 per cent. per annum. The Newfoundland Company will receive at once, and in any case, £100 for each £100—any further distribution, exclusive of the proceeds of their land rights, to the late shareholders in that company, which has now ceased to exist, depending upon the solution of the difficulties that have arisen with respect to their rights in Newfoundland.

It is understood that the final arrangements for the Globe scheme, for the further amalgamation of all the cable companies, will be completed in a few days.

The liquidators of the French Atlantic Telegraph Company have given notice that the transfer books have been closed, and will not be re-opened. They have further notified that the debentures of the company, viz., £400,000, issued at 95, will be paid off at par on the 1st of October, the funds for which will be raised by the alotment of a sufficient amount of amalgamated stock *pro rata* to the French cable shareholders, at 12 per cent. discount.

THE BRAZILIAN TELEGRAPHS.
